Before going further into the question of infantile sexuality I must mention an error into which I fell for a while and which might well have had fatal consequences for the whole of my work. Under the influence of the technical procedure which I used at that time, the majority of my patients reproduced from their childhood scenes in which they were sexually seduced by some grown-up person. With female patients the part of seducer was almost always assigned to their father. I believed these stories, and consequently supposed that I had discovered the roots of the subsequent neurosis in these experiences of sexual seduction in childhood. My confidence was strengthened by a few cases in which relations of this kind with a father, uncle, or elder brother had continued up to an age at which memory was to be trusted. If the reader feels inclined to shake his head at my credulity, I cannot altogether blame him; though I may plead that this was at a time when I was intentionally keeping my critical faculty in abeyance so as to preserve an unprejudiced and receptive attitude towards the many novelties which were coming to my notice every day. When, however, I was at last obliged to recognize that these scenes of seduction had never taken place, and that they were only phantasies which my patients had made up or which I myself had perhaps forced on them, I was for some time completely at a loss. My confidence alike in my technique and in its results suffered a severe blow; it could not be disputed that I had arrived at these scenes by a technical method which I considered correct, and their subject-matter was unquestionably related to the symptoms from which my investigation had started. When I had pulled myself together, I was able to draw the right conclusions from my discovery: namely, that the neurotic symptoms were not related directly to actual events but to wishful phantasies, and that as far as the neurosis was concerned psychical reality was of more importance than material reality. I do not believe even now that I forced the seduction-phantasies on my patients, that I 'suggested' them. I had in fact stumbled for the first time upon the *Oedipus complex*, which was later to assume such an overwhelming importance, but which I did not recognize as yet in its disguise of phantasy. Moreover, seduction during childhood retained a certain share, though a humbler one, in the aetiology of neuroses. But the seducers turned out as a rule to have been older children.

It will be seen, then, that my mistake was of the same kind as would be made by someone who believed that the legendary story of the early kings of Rome (as told by Livy) was historical truth instead of what it is in fact - a reaction against the memory of times and circumstances that were insignificant and occasionally, perhaps, inglorious. When the mistake had been cleared up, the path to the study of the sexual life of children lay open. It thus became possible to apply psycho-analysis to another field of science and to use its data as a means of discovering a new piece of biological knowledge.

The sexual function, as I found, is in existence from the very beginning of the individual's life, though at first it is attached to the other vital functions and does not become independent of them until later; it has to pass through a long and complicated process of development before it becomes what we are familiar with as the normal sexual life of the adult. It begins by manifesting itself in the activity of a whole number of *component instincts*. These are dependent upon *erotogenic zones* in the body; some of them make their appearance in pairs of opposite impulses (such as sadism and masochism or the impulses to look and to be looked at); they operate independently of one another in a search for pleasure, and they find their object for the most part in the subject's own body. Thus at first the sexual function is non-centralized and predominantly *auto-erotic*. Later, syntheses begin to appear in it; a first stage of organization is reached under the dominance of the *oral* components, an *anal-sadistic* stage follows, and it is only after the third stage has at last been reached that the primacy of the *genitals* is established and that the sexual function begins to serve the ends of reproduction. In the course of this process of development a number of elements of the various component instincts turn out to be unserviceable for this last end and are therefore left on one side or turned to other uses, while others are diverted from their aims and carried over into the genital organization. I gave the name of *libido* to the energy of the sexual instincts and to that form of energy alone. I was next driven to suppose that the libido does not always pass through its prescribed course of development smoothly. As a result either of the excessive strength of certain of the components or of experiences involving premature satisfaction, *fixations* of the libido may occur at various points in the course of its development. If subsequently a repression takes place, the libido flows back to these points (a process described as *regression*), and it is from them that the energy breaks through in the form of a symptom. Later on it further became clear that the localization of the point of fixation is what determines the *choice of neurosis*, that is, the form in which the subsequent illness makes its appearance.

The process of arriving at an *object*, which plays such an important part in mental life, takes place alongside of the organization of the libido. After the stage of *auto-erotism*, the first love-object in the case of both sexes is the mother; and it seems probable that to begin with a child does not distinguish its mother's organ of nutrition from its own body. Later, but still in the first years of infancy, the relation known as the *Oedipus complex* becomes established: boys concentrate their sexual wishes upon their mother and develop hostile impulses against their father as being a rival, while girls adopt an analogous attitude.¹ All of the different variations and consequences of the Oedipus complex are important; and the innately bisexual constitution of human beings makes itself felt and increases the number of simultaneously active tendencies. Children do not become clear for quite a long time about the differences between the sexes; and during this period of *sexual researches* they produce typical *sexual theories* which, being circumscribed by the incompleteness of their authors' own physical development, are a mixture of truth and error and fail to solve the problems of sexual life (the riddle of the Sphinx - that is, the question of where babies come from). We see, then, that a child's first object-choice is an *incestuous* one. The whole course of development that I have described is run through rapidly. For the most remarkable feature of the sexual life of man is its *diphasic* onset, its onset in two waves, with an interval between them. It reaches a first climax in the fourth or fifth year of a child's life. But thereafter this early efflorescence of sexuality passes off; the sexual impulses which have shown such liveliness are overcome by repression, and a *period of latency* follows, which lasts until puberty and during which the *reaction-formations* of morality, shame, and disgust are built up.² Of all living creatures man alone seems to show this diphasic onset of sexual growth, and it may perhaps be the biological determinant of his predisposition to neuroses. At puberty the impulses and object-relations of a child's early years become re-animated, and amongst them the emotional ties of its Oedipus complex. In the sexual life of puberty there is a struggle between the urges of early years and the inhibitions of the latency period. Before this, and while the child is at the highest point of its infantile sexual development, a genital organization of a sort is established; but only the male genitals play a part in it, and the female ones remain undiscovered. (I have described this as the period of *phallic* primacy.) At this stage the contrast between the sexes is not stated in terms of 'male' or 'female' but of 'possessing a penis' or 'castrated'. The *castration complex* which arises in this connection is of the profoundest importance in the formation alike of character and of neuroses.

¹ (*Footnote added 1935:*) The information about infantile sexuality was obtained from the study of men and the theory deduced from it was concerned with male children. It was natural enough to expect to find a complete parallel between the two sexes; but this turned out not to hold. Further investigations and reflections revealed profound differences between the sexual development of men and women. The first sexual object of a baby girl (just as of a baby boy) is her mother; and before a woman can reach the end of her normal development she has to change not only her sexual object but also her leading genital zone. From this circumstance difficulties arise and possibilities of inhibition which are not present in the case of men.

² (*Footnote added 1935:*) The period of latency is a physiological phenomenon. It can, however, only give rise to a complete interruption of sexual life in cultural organizations which have made the suppression of infantile sexuality a part of their system. This is not the case with the majority of primitive peoples.

In order to make this condensed account of my discoveries upon the sexual life of man more intelligible, I have brought together conclusions which I reached at different dates and incorporated by way of supplement or correction in the successive editions of my *Three Essays on the Theory of Sexuality* (1905d). I hope it will have been easy to gather the nature of my extension (on which so much stress has been laid and which has excited so much opposition) of the concept of sexuality. That extension is of a twofold kind. In the first place sexuality is divorced from its too close connection with the genitals and is regarded as a more comprehensive bodily function, having pleasure as its goal and only secondarily coming to serve the ends of reproduction. In the second place the sexual impulses are regarded as including all of those merely affectionate and friendly impulses to which usage applies the exceedingly ambiguous word 'love'. I do not, however, consider that these extensions are innovations but rather restorations: they signify the removal of inexpedient limitations of the concept into which we had allowed ourselves to be led.

The detaching of sexuality from the genitals has the advantage of allowing us to bring the sexual activities of children and of perverts into the same scope as those of normal adults. The sexual activities of children have hitherto been entirely neglected and though those of perverts have been recognized it has been with moral indignation and without understanding. Looked at from the psycho-analytic standpoint, even the most eccentric and repellent perversions are explicable as manifestations of component instincts of sexuality which have freed themselves from the primacy of the genitals and are now in pursuit of pleasure on their own account as they were in the very early days of the libido's development. The most important of these perversions, homosexuality, scarcely deserves the name. It can be traced back to the constitutional bisexuality of all human beings and to the after-effects of the phallic primacy. Psycho-analysis enables us to point to some trace or other of a homosexual object-choice in everyone. If I have described children as 'polymorphously perverse', I was only using a terminology that was generally current; no moral judgement was implied by the phrase. Psycho-analysis has no concern whatever with such judgements of value.

The second of my alleged extensions of the concept of sexuality finds its justification in the fact revealed by psycho-analytic investigation that all of these affectionate impulses were originally of a completely sexual nature but have become *inhibited in their aim* or *sublimated*. The manner in which the sexual instincts can thus be influenced and diverted enables them to be employed for cultural activities of every kind, to which indeed they bring the most important contributions.

My surprising discoveries as to the sexuality of children were made in the first instance through the analysis of adults. But later (from about 1908 onwards) it became possible to confirm them fully and in every detail by direct observations upon children. Indeed, it is so easy to convince oneself of the regular sexual activities of children that one cannot help asking in astonishment how the human race can have succeeded in overlooking the facts and in maintaining for so long the wishful legend of the asexuality of childhood. This surprising circumstance must be connected with the amnesia which, with the majority of adults, hides their own infancy.

IV

The theories of resistance and of repression, of the unconscious, of the aetiological significance of sexual life and of the importance of infantile experiences - these form the principal constituents of the theoretical structure of psycho-analysis. In these pages, unfortunately, I have been able to describe only the separate elements and not their interconnections and their bearing upon one another. But I am obliged now to turn to the alterations which gradually took place in the technique of the analytic method.

The means which I first adopted for overcoming the patient's resistance, by insistence and encouragement, had been indispensable for the purpose of giving me a first general survey of what was to be expected. But in the long run it proved to be too much of a strain on both sides, and further, it seemed open to certain obvious criticisms. It therefore gave place to another method which was in one sense its opposite. Instead of urging the patient to say something upon some particular subject, I now asked him to abandon himself to a process of *free association* - that is, to say whatever came into his head, while ceasing to give any conscious direction to his thoughts. It was essential, however, that he should bind himself to report literally everything that occurred to his self-perception and not to give way to critical objections which sought to put certain associations on one side on the ground that they were not sufficiently important or that they were irrelevant or that they were altogether meaningless. There was no necessity to repeat explicitly the demand for candour on the patient's part in reporting his thoughts, for it was the precondition of the whole analytic treatment.

It may seem surprising that this method of free association, carried out subject to the observation of the *fundamental rule of psycho-analysis*, should have achieved what was expected of it, namely the bringing into consciousness of the repressed material which was held back by resistances. We must, however, bear in mind that free association is not really free. The patient remains under the influence of the analytic situation even though he is not directing his mental activities on to a particular subject. We shall be justified in assuming that nothing will occur to him that has not some reference to that situation. His resistance against reproducing the repressed material will now be expressed in two ways. Firstly it will be shown by critical objections; and it was to deal with these that the fundamental rule of psycho-analysis was invented. But if the patient observes that rule and so overcomes his reticences, the resistance will find another means of expression. It will so arrange it that the repressed material itself will never occur to the patient but only something which approximates to it in an allusive way; and the greater the resistance, the more remote from the actual idea that the analyst is in search of will be the substitutive association which the patient has to report. The analyst, who listens composedly but without any constrained effort to the stream of associations and who, from his experience, has a general notion of what to expect, can make use of the material brought to light by the patient according to two possibilities. If the resistance is slight he will be able from the patient's allusions to infer the unconscious material itself; or if the resistance is stronger he will be able to recognize its character from the associations, as they seem to become more remote from the topic in hand, and will explain it to the patient. Uncovering the resistance, however, is the first step towards overcoming it. Thus the work of analysis involves an *art of interpretation*, the successful handling of which may require tact and practice but which is not hard to acquire. But it is not only in the saving of labour that the method of free association has an advantage over the earlier method. It exposes the patient to the least possible amount of compulsion, it never allows of contact being lost with the actual current situation, it guarantees to a great extent that no factor in the structure of the neurosis will be overlooked and that nothing will be introduced into it by the expectations of the analyst. It is left to the patient in all essentials to determine the course of the analysis and the arrangement of the material; any systematic handling of particular symptoms or complexes thus becomes impossible. In complete contrast to what happened with hypnotism and with the urging method, interrelated material makes its appearance at different times and at different points in the treatment. To a spectator, therefore - though in fact there must be none - an analytic treatment would seem completely obscure.

Another advantage of the method is that it need never break down. It must theoretically always be possible to have an association, provided that no conditions are made as to its character. Yet there is one case in which in fact a breakdown occurs with absolute regularity; from its very uniqueness, however, this case too can be interpreted.

I now come to the description of a factor which adds an essential feature to my picture of analysis and which can claim, alike technically and theoretically, to be regarded as of the first importance. In every analytic treatment there arises, without the physician's agency, an intense emotional relationship between the patient and the analyst which is not to be accounted for by the actual situation. It can be of a positive or of a negative character and can vary between the extremes of a passionate, completely sensual love and the unbridled expression of an embittered defiance and hatred. This *transference* - to give it its short name - soon replaces in the patient's mind the desire to be cured, and, so long as it is affectionate and moderate, becomes the agent of the physician's influence and neither more nor less than the mainspring of the joint work of analysis. Later on, when it has become passionate or has been converted into hostility, it becomes the principal tool of the resistance. It may then happen that it will paralyse the patient's powers of associating and endanger the success of the treatment. Yet it would be senseless to try to evade it; for an analysis without transference is an impossibility. It must not be supposed, however, that transference is created by analysis and does not occur apart from it. Transference is merely uncovered and isolated by analysis. It is a universal phenomenon of the human mind, it decides the success of all medical influence, and in fact dominates the whole of each person's relations to his human environment. We can easily recognize it as the same dynamic factor which the hypnotists have named 'suggestibility', which is the agent of hypnotic *rappport* and whose incalculable behaviour led to difficulties with the cathartic method as well. When there is no inclination to a transference of emotion such as this, or when it has become entirely negative, as happens in dementia praecox or paranoia, then there is also no possibility of influencing the patient by psychological means.

It is perfectly true that psycho-analysis, like other psychotherapeutic methods, employs the instrument of suggestion (or transference). But the difference is this: that in analysis it is not allowed to play the decisive part in determining the therapeutic results. It is used instead to induce the patient to perform a piece of psychical work - the overcoming of his transference resistances - which involves a permanent alteration in his mental economy. The transference is made conscious to the patient by the analyst, and it is resolved by convincing him that in his transference-attitude he is *re-experiencing* emotional relations which had their origin in his earliest object-attachments during the repressed period of his childhood. In this way the transference is changed from the strongest weapon of the resistance into the best instrument of the analytic treatment. Nevertheless its handling remains the most difficult as well as the most important part of the technique of analysis.

With the help of the method of free association and of the related art of interpretation, psycho-analysis succeeded in achieving one thing which appeared to be of no practical importance but which in fact necessarily led to a totally fresh attitude and a fresh scale of values in scientific thought. It became possible to prove that *dreams* have a meaning, and to discover it. In classical antiquity great importance was attached to dreams as foretelling the future; but modern science would have nothing to do with them, it handed them over to superstition, declaring them to be purely 'somatic' processes - a kind of twitching of a mind that is otherwise asleep. It seemed quite inconceivable that anyone who had done serious scientific work could make his appearance as an 'interpreter of dreams'. But by disregarding the excommunication pronounced upon dreams, by treating them as unexplained neurotic symptoms, as delusional or obsessional ideas, by neglecting their apparent content and by making their separate component images into subjects for free association, psycho-analysis arrived at a different conclusion. The numerous associations produced by the dreamer led to the discovery of a thought-structure which could no longer be described as absurd or confused, which ranked as a completely valid psychical product, and of which the *manifest* dream was no more than a distorted, abbreviated, and misunderstood translation, and for the most part a translation into visual images. These *latent dream-thoughts* contained the meaning of the dream, while its manifest content was simply a make-believe, a façade, which could serve as a starting-point for the associations but not for the interpretation.

There were now a whole series of questions to be answered, among the most important of them being whether the formation of dreams had a motive, under what conditions it took place, by what methods the dream-thoughts (which are invariably full of sense) become converted into the dream (which is often senseless), and others besides. I attempted to solve all of these problems in *The Interpretation of Dreams*, which I published in the year 1900. I can only find space here for the briefest abstract of my investigation. When the latent dream-thoughts that are revealed by the analysis of a dream are examined, one of them is found to stand out from among the rest, which are intelligible and well known to the dreamer. These latter thoughts are residues of waking life (the *day's residues*, as they are called technically); but the isolated thought is found to be a wishful impulse, often of a very repellent kind, which is foreign to the waking life of the dreamer and is consequently disavowed by him with surprise or indignation. This impulse is the actual constructor of the dream: it provides the energy for its production and makes use of the day's residues as material. The dream which thus originates represents a situation of satisfaction for the impulse, it is the fulfilment of its wish. It would not be possible for this process to take place without being favoured by the presence of something in the nature of a state of sleep. The necessary mental precondition of sleep is the concentration of the ego upon the wish to sleep and the withdrawal of psychical energy from all the interests of life. Since at the same time all the paths of approach to motility are blocked, the ego is also able to reduce the expenditure by which at other times it maintains the repressions. The unconscious impulse makes use of this nocturnal relaxation of repression in order to push its way into consciousness with the dream. But the repressive resistance of the ego is not abolished in sleep but merely reduced. Some of it remains in the shape of a *censorship of dreams* and forbids the unconscious impulse to express itself in the forms which it would properly assume. In consequence of the severity of the censorship of dreams, the latent dream-thoughts are obliged to submit to being altered and softened so as to make the forbidden meaning of the dream unrecognizable. This is the explanation of *dream-distortion*, which accounts for the most striking characteristics of the manifest dream. We are therefore justified in asserting that *a dream is the (disguised) fulfilment of a (repressed) wish*. It will now be seen that dreams are constructed like a neurotic symptom: they are compromises between the demands of a repressed impulse and the resistance of a censoring force in the ego. Since they have a similar origin they are equally unintelligible and stand in equal need of interpretation.

There is no difficulty in discovering the general function of dreaming. It serves the purpose of fending off, by a kind of soothing action, external or internal stimuli which would tend to arouse the sleeper, and thus of securing sleep against interruption. External stimuli are fended off by being given a new interpretation and by being woven into some harmless situation; internal stimuli, caused by instinctual demands, are given free play by the sleeper and allowed to find satisfaction in the formation of dreams, so long as the latent dream-thoughts submit to the control of the censorship. But if they threaten to break free and the meaning of the dream becomes too plain, the sleeper cuts short the dream and wakes in a fright. (Dreams of this class are known as *anxiety-dreams*.) A similar failure in the function of dreaming occurs if an external stimulus becomes too strong to be fended off. (This is the class of *arousal-dreams*.) I have given the name of *dream-work* to the process which, with the co-operation of the censorship, converts the latent thoughts into the manifest content of the dream. It consists of a peculiar way of treating the preconscious material of thought, so that its component parts become *condensed*, its psychical emphasis becomes *displaced*, and the whole of it is translated into visual images or *dramatized*, and completed by a deceptive *secondary revision*. The dream-work is an excellent example of the processes occurring in the deeper, unconscious layers of the mind, which differ considerably from the familiar normal processes of thought. It also displays a number of archaic characteristics, such as the use of a *symbolism* (in this case of a predominantly sexual kind) which it has since also been possible to discover in other spheres of mental activity.

We have explained that the unconscious instinctual impulse of the dream connects itself with a residue of the day, with some interest of waking life which has not been disposed of; it thus gives the dream which it constructs a double value for the work of analysis. For on the one hand a dream that has been analysed reveals itself as the fulfilment of a repressed wish; but on the other hand it may be a continuation of some preconscious activity of the day before and may contain every kind of subject-matter and give expression to an intention, a warning, a reflection, or once more to the fulfilment of a wish. Analysis exploits the dream in both directions, as a means of obtaining knowledge alike of the patient's conscious and of his unconscious processes. It also profits from the fact that dreams have access to the forgotten material of childhood, and so it happens that infantile amnesia is for the most part overcome in connection with the interpretation of dreams. In this respect dreams achieve a part of what was previously the task of hypnotism. On the other hand, I have never maintained the assertion which has so often been ascribed to me that dream-interpretation shows that all dreams have a sexual content or are derived from sexual motive forces. It is easy to see that hunger, thirst, or the need to excrete, can produce dreams of satisfaction just as well as any repressed sexual or egoistic impulse. The case of young children affords us a convenient test of the validity of our theory of dreams. In them the various psychical systems are not yet sharply divided and the repressions have not yet grown deep, so that we often come upon dreams which are nothing more than undisguised fulfilments of wishful impulses left over from waking life. Under the influence of imperative needs, adults may also produce dreams of this infantile type.¹

¹ (*Footnote added 1935:*) When it is considered how frequently the function of dreaming miscarries, the dream may aptly be characterized as an *attempt* at the fulfilment of a wish. Aristotle's old definition of the dream as mental life during sleep still holds good. There was a reason for my choosing as the title of my book not *The Dream* but *The Interpretation of Dreams*.

In the same way that psycho-analysis makes use of dream-interpretation, it also profits by the study of the numerous little slips and mistakes which people make - symptomatic actions, as they are called. I investigated this subject in a series of papers which were published for the first time in book form in 1904 under the title of *The Psychopathology of Everyday Life*. In this widely circulated work I have pointed out that these phenomena are not accidental, that they require more than physiological explanations, that they have a meaning and can be interpreted, and that one is justified in inferring from them the presence of restrained or repressed impulses and intentions. But what constitutes the enormous importance of dream-interpretation, as well as of this latter study, is not the assistance they give to the work of analysis but another of their attributes. Previously psycho-analysis had only been concerned with solving pathological phenomena and in order to explain them it had often been driven into making assumptions whose comprehensiveness was out of all proportion to the importance of the actual material under consideration. But when it came to dreams, it was no longer dealing with a pathological symptom, but with a phenomenon of normal mental life which might occur in any healthy person. If dreams turned out to be constructed like symptoms, if their explanation required the same assumptions - the repression of impulses, substitutive formation, compromise-formation, the dividing of the conscious and the unconscious into various psychical systems - then psycho-analysis was no longer an auxiliary science in the field of psychopathology, it was rather the starting-point of a new and deeper science of the mind which would be equally indispensable for the understanding of the normal. Its postulates and findings could be carried over to other regions of mental happening; a path lay open to it that led far afield, into spheres of universal interest.

V

I must interrupt my account of the internal growth of psycho-analysis and turn to its external history. What I have so far described of its discoveries has related for the most part to the results of my own work; but I have also filled in my story with material from later dates and have not distinguished between my own contributions and those of my pupils and followers.

For more than ten years after my separation from Breuer I had no followers. I was completely isolated. In Vienna I was shunned; abroad no notice was taken of me. My *Interpretation of Dreams*, published in 1900, was scarcely reviewed in the technical journals. In my paper 'On the History of the Psycho-Analytic Movement' I mentioned as an instance of the attitude adopted by psychiatric circles in Vienna a conversation with an assistant at the clinic, who had written a book against my theories but had never read my *Interpretation of Dreams*. He had been told at the clinic that it was not worth while. The man in question, who has since become a professor, has gone so far as to repudiate my report of the conversation and to throw doubts in general upon the accuracy of my recollection. I can only say that I stand by every word of the account I then gave.

As soon as I realized the inevitable nature of what I had come up against, my sensitiveness greatly diminished. Moreover my isolation gradually came to an end. To begin with, a small circle of pupils gathered round me in Vienna; and then, after 1906, came the news that the psychiatrists at Zurich, E. Bleuler, his assistant C. G. Jung, and others, were taking a lively interest in psycho-analysis. We got into personal touch with one another, and at Easter 1908 the friends of the young science met at Salzburg, agreed upon the regular repetition of similar informal congresses and arranged for the publication of a journal which was edited by Jung and was given the title of *Jahrbuch für psychoanalytische und psychopathologische Forschungen*. It was brought out under the direction of Bleuler and myself and ceased publication at the beginning of the World War. At the same time that the Swiss psychiatrists joined the movement, interest in psycho-analysis began to be aroused all over Germany as well; it became the subject of a large number of written comments and of lively discussions at scientific congresses. But its reception was nowhere friendly or even benevolently non-committal. After the briefest acquaintance with psycho-analysis German science was united in rejecting it.

Even to-day it is of course impossible for me to foresee the final judgment of posterity upon the value of psycho-analysis for psychiatry, psychology, and the mental sciences in general. But I fancy that, when the history of the phase we have lived through comes to be written, German science will not have cause to be proud of those who represented it. I am not thinking of the fact that they rejected psycho-analysis or of the decisive way in which they did so; both of these things were easily intelligible, they were only to be expected and at any rate they threw no discredit on the character of the opponents of analysis. But for the degree of arrogance which they displayed, for their conscienceless contempt of logic, and for the coarseness and bad taste of their attacks there could be no excuse. It may be said that it is childish of me to give free rein to such feelings as these now, after fifteen years have passed; nor would I do so unless I had something more to add. Years later, during the World War, when a chorus of enemies were bringing against the German nation the charge of barbarism, a charge which sums up all that I have written above, it none the less hurt deeply to feel that my own experience would not allow me to contradict it.

One of my opponents boasted of silencing his patients as soon as they began to talk of anything sexual and evidently thought that this technique gave him a right to judge the part played by sexuality in the aetiology of the neuroses. Apart from emotional resistances, which were so easily explicable by the psycho-analytic theory that it was impossible to be misled by them, it seemed to me that the main obstacle to agreement lay in the fact that my opponents regarded psycho-analysis as a product of my speculative imagination and were unwilling to believe in the long, patient and unbiased work which had gone to its making. Since in their opinion analysis had nothing to do with observation or experience, they believed that they themselves were justified in rejecting it without experience. Others again, who did not feel so strongly convinced of this, repeated in their resistance the classical manoeuvre of not looking through the microscope so as to avoid seeing what they had denied. It is remarkable, indeed, how incorrectly most people act when they are obliged to form a judgement of their own on some new subject. For years I have been told by 'benevolent' critics - and I hear the same thing even to-day - that psycho-analysis is right up to such-and-such a point but that there it begins to exaggerate and to generalize without justification. And I know that, though nothing is more difficult than to decide where such a point lies, these critics had been completely ignorant of the whole subject only a few weeks or days earlier.

The result of the official anathema against psycho-analysis was that the analysts began to come closer together. At the second Congress, held at Nuremberg in 1910, they formed themselves, on the proposal of Ferenczi, into an 'International Psycho-Analytical Association' divided into a number of local societies but under a common President. The Association survived the Great War and still exists, consisting to-day of branch societies in Austria, Germany, Hungary, Switzerland, Great Britain, Holland, Russia, and India, as well as two in the United States. I arranged that C. G. Jung should be appointed as the first President, which turned out later to have been a most unfortunate step. At the same time a second journal devoted to psycho-analysis was started, the *Zentralblatt für Psychoanalyse*, edited by Adler and Stekel, and a little later a third, *Imago*, edited by two non-medical analysts, H. Sachs and O. Rank, and intended to deal with the application of analysis to the mental sciences. Soon afterwards Bleuler published a paper in defence of psycho-analysis. Though it was a relief to find honesty and straightforward logic for once taking part in the dispute, yet I could not feel completely satisfied by Bleuler's essay. He strove too eagerly after an appearance of impartiality; nor is it a matter of chance that it is to him that our science owes the valuable concept of *ambivalence*. In later papers Bleuler adopted such a critical attitude towards the theoretical structure of analysis and rejected or threw doubts upon such essential parts of it that I could not help asking myself in astonishment what could be left of it for him to admire. Yet not only has he subsequently uttered the strongest pleas in favour of 'depth psychology' but he based his comprehensive study of schizophrenia upon it. Nevertheless Bleuler did not for long remain a member of the International Psycho-Analytical Association; he resigned from it as a result of misunderstandings with Jung, and the Burghölzli was lost to analysis.

Official disapproval could not hinder the spread of psycho-analysis either in Germany or in other countries. I have elsewhere followed the stages of its growth and given the names of those who were its first representatives. In 1909 G. Stanley Hall invited Jung and me to America to go to Clark University, Worcester, Mass., of which he was President, and to spend a week giving lectures (in German) at the celebration of the twentieth anniversary of that body's foundation. Hall was justly esteemed as a psychologist and educationalist, and had introduced psycho-analysis into his courses several years earlier; there was a touch of the 'king-maker' about him, a pleasure in setting up authorities and in then deposing them. We also met James J. Putnam there, the Harvard neurologist, who in spite of his age was an enthusiastic supporter of psycho-analysis and threw the whole weight of a personality that was universally respected into the defence of the cultural value of analysis and the purity of its aims. He was an estimable man, in whom, as a reaction against a predisposition to obsessional neurosis, an ethical bias predominated; and the only thing in him that was disquieting was his inclination to attach psycho-analysis to a particular philosophical system and to make it the servant of moral aims. Another event of this time which made a lasting impression on me was a meeting with William James the philosopher. I shall never forget one little scene that occurred as we were on a walk together. He stopped suddenly, handed me a bag he was carrying and asked me to walk on, saying that he would catch me up as soon as he had got through an attack of angina pectoris which was just coming on. He died of that disease a year later; and I have always wished that I might be as fearless as he was in the face of approaching death.

At that time I was only fifty-three. I felt young and healthy, and my short visit to the new world encouraged my self-respect in every way. In Europe I felt as though I were despised; but over there I found myself received by the foremost men as an equal. As I stepped on to the platform at Worcester to deliver my *Five Lectures on Psycho-Analysis* it seemed like the realization of some incredible day-dream: psycho-analysis was no longer a product of delusion, it had become a valuable part of reality. It has not lost ground in America since our visit; it is extremely popular among the lay public and is recognized by a number of official psychiatrists as an important element in medical training. Unfortunately, however, it has suffered a great deal from being watered down. Moreover, many abuses which have no relation to it find a cover under its name, and there are few opportunities for any thorough training in technique or theory. In America, too, it has come in conflict with Behaviourism, a theory which is naïve enough to boast that it has put the whole problem of psychology completely out of court.

In Europe during the years 1911-13 two secessionist movements from psycho-analysis took place, led by men who had previously played a considerable part in the young science, Alfred Adler and C. G. Jung. Both movements seemed most threatening and quickly obtained a large following. But their strength lay, not in their own content, but in the temptation which they offered of being freed from what were felt as the repellent findings of psycho-analysis even though its actual material was no longer rejected. Jung attempted to give to the facts of analysis a fresh interpretation of an abstract, impersonal and non-historical character, and thus hoped to escape the need for recognizing the importance of infantile sexuality and of the Oedipus complex as well as the necessity for any analysis of childhood. Adler seemed to depart still further from psycho-analysis; he entirely repudiated the importance of sexuality, traced back the formation both of character and of the neuroses solely to men's desire for power and to their need to compensate for their constitutional inferiorities, and threw all the psychological discoveries of psycho-analysis to the winds. But what he had rejected forced its way back into his closed system under other names; his 'masculine protest' is nothing else than repression unjustifiably sexualized. The criticism with which the two heretics were met was a mild one; I only insisted that both Adler and Jung should cease to describe their theories as 'psycho-analysis'. After a lapse of ten years it can be asserted that both of these attempts against psycho-analysis have blown over without doing any harm.

If a community is based on agreement upon a few cardinal points, it is obvious that people who have abandoned that common ground will cease to belong to it. Yet the secession of former pupils has often been brought up against me as a sign of my intolerance or has been regarded as evidence of some special fatality that hangs over me. It is a sufficient answer to point out that in contrast to those who have left me, like Jung, Adler, Stekel, and a few besides, there are a great number of men, like Abraham, Eitingon, Ferenczi, Rank, Jones, Brill, Sachs, Pfister, van Emden, Reik, and others, who have worked with me for some fifteen years in loyal collaboration and for the most part in uninterrupted friendship. I have only mentioned the oldest of my pupils, who have already made a distinguished name for themselves in the literature of psycho-analysis; if I have passed over others, that is not to be taken as a slight, and indeed among those who are young and have joined me lately talents are to be found on which great hopes may be set. But I think I can say in my defence that an intolerant man, dominated by an arrogant belief in his own infallibility, would never have been able to maintain his hold upon so large a number of intellectually eminent people, especially if he had at his command as few practical attractions as I had.

The World War, which broke up so many other organizations, could do nothing against our 'International'. The first meeting after the war took place in 1920, at The Hague, on neutral ground. It was moving to see how hospitably the Dutch welcomed the starving and impoverished subjects of the Central European states; and I believe this was the first occasion in a ruined world on which Englishmen and Germans sat at the same table for the friendly discussion of scientific interests. Both in Germany and in the countries of Western Europe the war had actually stimulated interest in psycho-analysis. The observation of war neuroses had at last opened the eyes of the medical profession to the importance of psychogenesis in neurotic disturbances, and some of our psychological conceptions, such as the 'gain from illness' and the 'flight into illness', quickly became popular. The last Congress before the German collapse, which was held at Budapest in 1918, was attended by official representatives of the allied governments of the Central European powers, and they agreed to the establishment of psycho-analytic Centres for the treatment of war neuroses. But this point was never reached. Similarly too the comprehensive plans made by one of our leading members, Dr. Anton von Freund, for establishing in Budapest a centre for analytic study and treatment came to grief as a result of the political upheavals that followed soon afterwards and of the premature death of their irreplaceable author. At a later date some of his ideas were put into execution by Max Eitingon, who in 1920 founded a psycho-analytical clinic in Berlin. During the brief period of Bolshevik rule in Hungary, Ferenczi was still able to carry on a successful course of instruction as the official representative of psycho-analysis at the University of Budapest. After the war our opponents were pleased to announce that events had produced a conclusive argument against the validity of the theses of analysis. The war neuroses, they said, had proved that sexual factors were unnecessary to the aetiology of neurotic disorders. But their triumph was frivolous and premature. For on the one hand no one had been able to carry out a thorough analysis of a case of war neurosis, so that in fact nothing whatever was known for certain as to their motivation and no conclusions could be drawn from this uncertainty; while on the other hand psycho-analysis had long before arrived at the concept of narcissism and of narcissistic neuroses, in which the subject's libido is attached to his own ego instead of to an object. Though on other occasions, therefore, the charge was brought against psycho-analysis of having made an unjustifiable extension of the concept of sexuality, yet, when it became convenient for controversial ends, this crime was forgotten and we were once more held down to the narrowest meaning of the word.

If the preliminary cathartic period is left on one side, the history of psycho-analysis falls from my point of view into two phases. In the first of these I stood alone and had to do all the work myself: this was from 1895-6 until 1906 or 1907. In the second phase, lasting from then until the present time, the contributions of my pupils and collaborators have been growing more and more in importance, so that to-day, when a grave illness warns me of the approaching end, I can think with a quiet mind of the cessation of my own labours. For that very reason, however, it is impossible for me in this *Autobiographical Study* to deal as fully with the progress of psycho-analysis during the second phase as I did with its gradual rise during the first phase, which was concerned with my own activity alone. I feel that I should only be justified in mentioning here those new discoveries in which I still played a prominent part, in particular, therefore, those made in the sphere of narcissism, of the theory of the instincts, and of the application of psycho-analysis to the psychoses.

I must begin by adding that increasing experience showed more and more plainly that the Oedipus complex was the nucleus of the neurosis. It was at once the climax of infantile sexual life and the point of junction from which all of its later developments proceeded. But if so, it was no longer possible to expect analysis to discover a factor that was specific in the aetiology of the neuroses. It must be true, as Jung expressed it so well in the early days when he was still an analyst, that neuroses have no peculiar content which belongs exclusively to them but that neurotics break down at the same difficulties that are successfully overcome by normal people. This discovery was very far from being a disappointment. It was in complete harmony with another one: that the depth-psychology revealed by psycho-analysis was in fact the psychology of the normal mind. Our path had been like that of chemistry: the great qualitative differences between substances were traced back to quantitative variations in the proportions in which the same elements were combined.

In the Oedipus complex the libido was seen to be attached to the image of the parental figures. But earlier there was a period in which there were no such objects. There followed from this fact the concept (of fundamental importance for the libido theory) of a state in which the subject's libido filled his own ego and had that for its object. This state could be called *narcissism* or self-love. A moment's reflection showed that this state never completely ceases. All through the subject's life his ego remains the great reservoir of his libido, from which object-cathexes are sent out and into which the libido can stream back again from the objects. Thus narcissistic libido is constantly being transformed into object-libido, and *vice versa*. An excellent instance of the length to which this transformation can go is afforded by the state of being in love, whether in a sexual or sublimated manner, which goes so far as involving a sacrifice of the self. Whereas hitherto in considering the process of repression attention had only been paid to what was repressed, these ideas made it possible to form a correct estimate of the repressing forces too. It had been said that repression was set in action by the instincts of self-preservation operating in the ego (the 'ego-instincts') and that it was brought to bear upon the libidinal instincts. But since the instincts of self-preservation were now recognized as also being of a libidinal nature, as being narcissistic libido, the process of repression was seen to be a process occurring within the libido itself; narcissistic libido was opposed to object-libido, the interest of self-preservation was defending itself against the demands of object-love, and therefore against the demands of sexuality in the narrower sense as well.

There is no more urgent need in psychology than for a securely founded theory of the instincts on which it might then be possible to build further. Nothing of the sort exists, however, and psycho-analysis is driven to making tentative efforts towards some such theory. It began by drawing a contrast between the ego-instincts (the instinct of self-preservation, hunger) and the libidinal instincts (love), but later replaced it by a new contrast between narcissistic and object-libido. This was clearly not the last word on the subject; biological considerations seemed to make it impossible to remain content with assuming the existence of only a single class of instincts.

In the works of my later years (*Beyond the Pleasure Principle*, *Group Psychology and the Analysis of the Ego*, and *The Ego and the Id*), I have given free rein to the inclination, which I kept down for so long, to speculation, and I have also contemplated a new solution of the problem of the instincts. I have combined the instincts for self-preservation and for the preservation of the species under the concept of *Eros* and have contrasted with it an *instinct of death* or *destruction* which works in silence. Instinct in general is regarded as a kind of elasticity of living things, an impulsion towards the restoration of a situation which once existed but was brought to an end by some external disturbance. This essentially conservative character of instincts is exemplified by the phenomena of the *compulsion to repeat*. The picture which life presents to us is the result of the concurrent and mutually opposing action of *Eros* and the death instinct.

It remains to be seen whether this construction will turn out to be serviceable. Although it arose from a desire to fix some of the most important theoretical ideas of psycho-analysis, it goes far beyond psycho-analysis. I have repeatedly heard it said contemptuously that it is impossible to take a science seriously whose most general concepts are as lacking in precision as those of libido and of instinct in psycho-analysis. But this reproach rests on a complete misconception of the facts. Clear basic concepts and sharply drawn definitions are only possible in the mental sciences in so far as the latter seek to fit a region of facts into the frame of a logical system. In the natural sciences, of which psychology is one, such clear-cut general concepts are superfluous and indeed impossible. Zoology and Botany did not start from correct and adequate definitions of an animal and a plant; to this very day biology has been unable to give any certain meaning to the concept of life. Physics itself, indeed, would never have made any advance if it had had to wait until its concepts of matter, force, gravitation, and so on, had reached the desirable degree of clarity and precision. The basic ideas or most general concepts in any of the disciplines of science are always left indeterminate at first and are only explained to begin with by reference to the realm of phenomena from which they were derived; it is only by means of a progressive analysis of the material of observation that they can be made clear and can find a significant and consistent meaning. I have always felt it as a gross injustice that people have refused to treat psycho-analysis like any other science. This refusal found an expression in the raising of the most obstinate objections. Psycho-analysis was constantly reproached for its incompleteness and insufficiencies; though it is plain that a science based upon observation has no alternative but to work out its findings piecemeal and to solve its problems step by step. Again, when I endeavoured to obtain for the sexual function the recognition which had so long been withheld from it, psycho-analytic theory was branded as 'pan-sexualism'. And when I laid stress on the hitherto neglected importance of the part played by the accidental impressions of early youth, I was told that psycho-analysis was denying constitutional and hereditary factors - a thing which I had never dreamt of doing. It was a case of contradiction at any price and by any methods.

I had already made attempts at earlier stages of my work to arrive at some more general points of view on the basis of psycho-analytic observation. In a short essay, 'Formulations on the Two Principles of Mental Functioning', I drew attention (and there was, of course, nothing original in this) to the domination of the *pleasure-unpleasure principle* in mental life and to its displacement by what is called the *reality principle*. Later on I made an attempt to produce a 'Metapsychology'. By this I meant a method of approach according to which every mental process is considered in relation to three co-ordinates, which I described as *dynamic*, *topographical*, and *economic* respectively; and this seemed to me to represent the furthest goal that psychology could attain. The attempt remained no more than a torso; after writing two or three papers - 'Instincts and their Vicissitudes', 'Repression', 'The Unconscious', 'Mourning and Melancholia', etc. - I broke off, wisely perhaps, since the time for theoretical predications of this kind had not yet come. In my latest speculative works I have set about the task of dissecting our mental apparatus on the basis of the analytic view of pathological facts and have divided it into an *ego*, an *id*, and a *super-ego*.¹ The super-ego is the heir of the Oedipus complex and represents the ethical standards of mankind.

I should not like to create an impression that during this last period of my work I have turned my back upon patient observation and have abandoned myself entirely to speculation. I have on the contrary always remained in the closest touch with the analytic material and have never ceased working at detailed points of clinical or technical importance. Even when I have moved away from observation, I have carefully avoided any contact with philosophy proper. This avoidance has been greatly facilitated by constitutional incapacity. I was always open to the ideas of G. T. Fechner and have followed that thinker upon many important points. The large extent to which psycho-analysis coincides with the philosophy of Schopenhauer - not only did he assert the dominance of the emotions and the supreme importance of sexuality but he was even aware of the mechanism of repression - is not to be traced to my acquaintance with his teaching. I read Schopenhauer very late in my life. Nietzsche, another philosopher whose guesses and intuitions often agree in the most astonishing way with the laborious findings of psycho-analysis, was for a long time avoided by me on that very account; I was less concerned with the question of priority than with keeping my mind unembarrassed.

¹ *The Ego and the Id*.

The neuroses were the first subject of analysis, and for a long time they were the only one. No analyst could doubt that medical practice was wrong in separating those disorders from the psychoses and in attaching them to the organic nervous diseases. The theory of the neuroses belongs to psychiatry and is indispensable as an introduction to it. It would seem, however, that the analytic study of the *psychoses* is impracticable owing to its lack of therapeutic results. Mental patients are as a rule without the capacity for forming a positive transference, so that the principal instrument of analytic technique is inapplicable to them. There are nevertheless a number of methods of approach to be found. Transference is often not so completely absent but that it can be used to a certain extent; and analysis has achieved undoubted successes with cyclical depressions, light paranoid modifications, and partial schizophrenias. It has at least been a benefit to science that in many cases the diagnosis can oscillate for quite a long time between assuming the presence of a psychoneurosis or of a dementia praecox; for therapeutic attempts initiated in such cases have resulted in valuable discoveries before they have had to be broken off. But the chief consideration in this connection is that so many things that in the neuroses have to be laboriously fetched up from the depths are found in the psychoses on the surface, visible to every eye. For that reason the best subjects for the demonstration of many of the assertions of analysis are provided by the psychiatric clinic. It was thus bound to happen before long that analysis would find its way to the objects of psychiatric observation. I was able very early (1896) to establish in a case of paranoid dementia the presence of the same aetiological factors and the same emotional complexes as in the neuroses. Jung explained some most puzzling stereotypies in demented by bringing them into relation with the patients' life-histories; Bleuler demonstrated the existence in various psychoses of mechanisms like those which analysis had discovered in neurotics. Since then analysts have never relaxed their efforts to come to an understanding of the psychoses. Especially since it has been possible to work with the concept of narcissism, they have managed, now in this place and now in that, to get a glimpse beyond the wall. Most of all, no doubt, was achieved by Abraham in his elucidation of the melancholias. It is true that in this sphere all our knowledge is not yet converted into therapeutic power; but the mere theoretical gain is not to be despised, and we may be content to wait for its practical application. In the long run even the psychiatrists cannot resist the convincing force of their own clinical material. At the present time German psychiatry is undergoing a kind of 'peaceful penetration' by analytic views. While they continually declare that they will never be psychoanalysts, that they do not belong to the 'orthodox' school or agree with its exaggerations, and in particular that they do not believe in the predominance of the sexual factor, nevertheless the majority of the younger workers take over one piece or another of analytic theory and apply it in their own fashion to the material. All the signs point to the proximity of further developments in the same direction.

V

I now watch from a distance the symptomatic reactions that are accompanying the introduction of psycho-analysis into the France which was for so long refractory. It seems like a reproduction of something I have lived through before, and yet it has peculiarities of its own. Objections of incredible simplicity are raised, such as that French sensitiveness is offended by the pedantry and crudity of psycho-analytic terminology. (One cannot help being reminded of Lessing's immortal Chevalier Riccaut de la Marlinière.) Another comment has a more serious ring (a Professor of Psychology at the Sorbonne did not think it beneath him): the whole mode of thought of psycho-analysis, so he declared, is inconsistent with the *génie latin*. Here the Anglo-Saxon allies of France, who count as supporters of analysis, are explicitly thrown over. Anyone hearing the remark would suppose that psycho-analysis had been the favourite child of the *génie teutonique* and had been clasped to its heart from the moment of birth.

In France the interest in psycho-analysis began among the men of letters. To understand this, it must be borne in mind that from the time of the writing of *The Interpretation of Dreams* psycho-analysis ceased to be a purely medical subject. Between its appearance in Germany and in France lies the history of its numerous applications to departments of literature and of aesthetics, to the history of religions and to prehistory, to mythology, to folklore, to education, and so on. None of these things have much to do with medicine; in fact it is only through psycho-analysis that they are connected with it. I have no business, therefore, to go into them in detail in these pages. I cannot pass them over completely in silence, however, for on the one hand they are essential to a correct appreciation of the nature and value of psycho-analysis, and on the other hand I have, after all, undertaken to give an account of my life-work. The beginnings of the majority of these applications of psycho-analysis will be found in my works. Here and there I have gone a little way along the path in order to gratify my non-medical interests. Later on, others (not only doctors, but specialists in the various fields as well) have followed in my tracks and penetrated far into the different subjects. But since my programme limits me to a mention of my own share in these applications of psycho-analysis, I can only give a quite inadequate picture of their extent and importance.

A number of suggestions came to me out of the Oedipus complex, the ubiquity of which gradually dawned on me. The poet's choice, or his invention, of such a terrible subject seemed puzzling; and so too did the overwhelming effect of its dramatic treatment, and the general nature of such tragedies of destiny. But all of this became intelligible when one realized that a universal law of mental life had here been captured in all its emotional significance. Fate and the oracle were no more than materializations of an internal necessity; and the fact of the hero's sinning without his knowledge and against his intentions was evidently a right expression of the *unconscious* nature of his criminal tendencies. From understanding this tragedy of destiny it was only a step further to understanding a tragedy of character - *Hamlet*, which had been admired for three hundred years without its meaning being discovered or its author's motives guessed. It could scarcely be a chance that this neurotic creation of the poet should have come to grief, like his numberless fellows in the real world, over the Oedipus complex. For Hamlet was faced with the task of taking vengeance on another for the two deeds which are the subject of the Oedipus desires; and before that task his arm was paralysed by his own obscure sense of guilt. Shakespeare wrote *Hamlet* very soon after his father's death.¹ The suggestions made by me for the analysis of this tragedy were fully worked out later on by Ernest Jones. And the same example was afterwards used by Otto Rank as the starting-point for his investigation of the choice of material made by dramatists. In his large volume on the incest theme (Rank, 1912) he was able to show how often imaginative writers have taken as their subject the themes of the Oedipus situation, and traced in the different literatures of the world the way in which the material has been transformed, modified, and softened.

¹ (*Footnote added 1935:*) This is a construction which I should like explicitly to withdraw. I no longer believe that William Shakespeare the actor from Stratford was the author of the works which have so long been attributed to him. Since the publication of J. T. Looney's volume '*Shakespeare Identified*', I am almost convinced that in fact Edward de Vere, Earl of Oxford, is concealed behind this pseudonym.

It was tempting to go on from there to an attempt at an analysis of poetic and artistic creation in general. The realm of imagination was seen to be a 'reservation' made during the painful transition from the pleasure principle to the reality principle in order to provide a substitute for instinctual satisfactions which had to be given up in real life. The artist, like the neurotic, had withdrawn from an unsatisfying reality into this world of imagination; but, unlike the neurotic, he knew how to find a way back from it and once more to get a firm foothold in reality. His creations, works of art, were the imaginary satisfactions of unconscious wishes, just as dreams are; and like them they were in the nature of compromises, since they too were forced to avoid any open conflict with the forces of repression. But they differed from the asocial, narcissistic products of dreaming in that they were calculated to arouse sympathetic interest in other people and were able to evoke and to satisfy the same unconscious wishful impulses in them too. Besides this, they made use of the perceptual pleasure of formal beauty as what I have called an 'incentive bonus'. What psycho-analysis was able to do was to take the interrelations between the impressions of the artist's life, his chance experiences, and his works, and from them to construct his constitution and the instinctual impulses at work in it - that is to say, that part of him which he shared with all men. With this aim in view, for instance, I made Leonardo da Vinci the subject of a study, which is based on a single memory of childhood related by him and which aims chiefly at explaining his picture of 'The Madonna and Child with St. Anne'. Since then my friends and pupils have undertaken numerous analyses of artists and their works. It does not appear that the enjoyment of a work of art is spoiled by the knowledge gained from such an analysis. The layman may perhaps expect too much from analysis in this respect, for it must be admitted that it throws no light on the two problems which probably interest him the most. It can do nothing towards elucidating the nature of the artistic gift, nor can it explain the means by which the artist works - artistic technique.

I was able to show from a short story by W. Jensen called *Gradiva*, which has no particular merit in itself, that invented dreams can be interpreted in the same way as real ones and that the unconscious mechanisms familiar to us in the 'dream-work' are thus also operative in the processes of imaginative writing. My book on *Jokes and their Relation to the Unconscious* was a side-issue directly derived from *The Interpretation of Dreams*. The only friend of mine who was at that time interested in my work remarked to me that my interpretations of dreams often impressed him as being like jokes. In order to throw some light on this impression, I began to investigate jokes and found that their essence lay in the technical methods employed in them, and that these were the same as the means used in the 'dream-work' - that is to say, condensation, displacement, the representation of a thing by its opposite or by something very small, and so on. This led to an economic enquiry into the origin of the high degree of pleasure obtained from hearing a joke. And to this the answer was that it was due to the momentary suspension of the expenditure of energy upon maintaining repression, owing to the attraction exercised by the offer of a bonus of pleasure (*fore-pleasure*).

I myself set a higher value on my contributions to the psychology of religion, which began with the establishment of a remarkable similarity between obsessive actions and religious practices or ritual (1907*b*). Without as yet understanding the deeper connections, I described the obsessional neurosis as a distorted private religion and religion as a kind of universal obsessional neurosis. Later on, in 1912, Jung's forcible indication of the far-reaching analogies between the mental products of neurotics and of primitive peoples led me to turn my attention to that subject. In four essays, which were collected into a book with the title of *Totem and Taboo*, I showed that the horror of incest was even more marked among primitive than among civilized races and had given rise to very special measures of defence against it. I examined the relations between taboo-prohibitions (the earliest form in which moral restrictions make their appearance) and emotional ambivalence; and I discovered under the primitive scheme of the universe known as 'animism' the principle of the over-estimation of the importance of psychical reality - the belief in 'the omnipotence of thoughts' - which lies at the root of magic as well. I developed the comparison with the obsessional neurosis at every point, and showed how many of the postulates of primitive mental life are still in force in that remarkable illness. Above all, however, I was attracted by totemism, the first system of organization in primitive tribes, a system in which the beginnings of social order are united with a rudimentary religion and the implacable domination of a small number of taboo-prohibitions. The being that is revered is ultimately always an animal, from which the clan also claims to be descended. Many indications pointed to the conclusion that every race, even the most highly developed, had once passed through the stage of totemism.

The chief literary sources of my studies in this field were the well-known works of J. G. Frazer (*Totemism and Exogamy* and *The Golden Bough*), a mine of valuable facts and opinions. But Frazer effected little towards elucidating the problems of totemism; he had several times fundamentally altered his views on the subject, and the other ethnologists and prehistorians seemed in equal uncertainty and disagreement. My starting-point was the striking correspondence between the two taboo-ordinances of totemism (not to kill the totem and not to have sexual relations with any woman of the same totem-clan) and the two elements of the Oedipus complex (getting rid of the father and taking the mother to wife). I was therefore tempted to equate the totem-animal with the father; and in fact primitive peoples themselves do this explicitly, by honouring it as the forefather of the clan. There next came to my help two facts from psycho-analysis, a lucky observation of a child made by Ferenczi, which enabled me to speak of an 'infantile return of totemism', and the analysis of early animal-phobias in children, which so often showed that the animal was a substitute for the father, a substitute on to which the fear of the father derived from the Oedipus complex had been displaced. Not much was lacking to enable me to recognize the killing of the father as the nucleus of totemism and the starting-point in the formation of religion.

This missing element was supplied when I became acquainted with W. Robertson Smith's work, *The Religion of the Semites*. Its author (a man of genius who was both a physicist and an expert in biblical researches) introduced the so-called 'totem meal' as an essential part of the totemic religion. Once a year the totem animal, which was at other times regarded as sacred, was solemnly killed in the presence of all the members of the clan, was devoured and was then mourned over. The mourning was followed by a great festival. When I further took into account Darwin's conjecture that men originally lived in hordes, each under the domination of a single powerful, violent and jealous male, there rose before me out of all these components the following hypothesis, or, I would rather say, vision. The father of the primal horde, since he was an unlimited despot, had seized all the women for himself; his sons, being dangerous to him as rivals, had been killed or driven away. One day, however, the sons came together and united to overwhelm, kill, and devour their father, who had been their enemy but also their ideal. After the deed they were unable to take over their heritage since they stood in one another's way. Under the influence of failure and remorse they learned to come to an agreement among themselves; they banded themselves into a clan of brothers by the help of the ordinances of totemism, which aimed at preventing a repetition of such a deed, and they jointly undertook to forgo the possession of the women on whose account they had killed their father. They were then driven to finding strange women, and this was the origin of the exogamy which is so closely bound up with totemism. The totem meal was the festival commemorating the fearful deed from which sprang man's sense of guilt (or 'original sin') and which was the beginning at once of social organization, of religion and of ethical restrictions.

Now whether we suppose that such a possibility was a historical event or not, it brings the formation of religion within the circle of the father-complex and bases it upon the ambivalence which dominates that complex. After the totem animal had ceased to serve as a substitute for him, the primal father, at once feared and hated, revered and envied, became the prototype of God himself. The son's rebelliousness and his affection for his father struggled against each other through a constant succession of compromises, which sought on the one hand to atone for the act of parricide and on the other to consolidate the advantages it had brought. This view of religion throws a particularly clear light upon the psychological basis of Christianity, in which, as we know, the ceremony of the totem meal still survives with but little distortion, in the form of Communion. I should like explicitly to mention that this last observation was not made by me but is to be found in the works of Robertson Smith and Frazer.

Theodor Reik and G. Róheim, the ethnologist, have taken up the line of thought which I developed in *Totem and Taboo* and, in a series of important works, have extended it, deepened it, or corrected it. I myself have since returned to it more than once, in the course of my investigations into the 'unconscious sense of guilt' (which also plays such an important part among the motives of neurotic suffering) and in my attempts at forming a closer connection between social psychology and the psychology of the individual.¹ I have moreover made use of the idea of an archaic heritage from the 'primal horde' epoch of mankind's development in explaining susceptibility to hypnosis.

¹ *The Ego and the Id and Group Psychology and the Analysis of the Ego.*

I have taken but little direct part in certain other applications of psycho-analysis, though they are none the less of general interest. It is only a step from the phantasies of individual neurotics to the imaginative creations of groups and peoples as we find them in myths, legends, and fairy tales. Mythology became the special province of Otto Rank; the interpretation of myths, the tracing of them back to the familiar unconscious complexes of early childhood, the replacing of astral explanations by a discovery of human motives, all of this is to a large extent due to his analytic efforts. The subject of symbolism, too, has found many students among my followers. Symbolism has brought psycho-analysis many enemies; many enquirers with unduly prosaic minds have never been able to forgive it the recognition of symbolism, which followed from the interpretation of dreams. But analysis is guiltless of the discovery of symbolism, for it had long been known in other regions of thought (such as folklore, legends, and myths) and plays an even larger part in them than in the 'language of dreams'.

I myself have contributed nothing to the application of analysis to education. It was natural, however, that the analytic discoveries about the sexual life and mental development of children should attract the attention of educators and make them see their problems in a new light. Dr. Oskar Pfister, a protestant pastor at Zurich, led the way as a tireless pioneer along these lines, nor did he find the practice of analysis incompatible with the retention of his religion, though it is true that this was of a sublimated kind. Among the many others who worked alongside of him I may mention Frau Dr. Hug-Hellmuth and Dr. S. Bernfeld, both of Vienna.¹ The application of analysis to the prophylactic upbringing of healthy children and to the correcting of those who, though not actually neurotic, have deviated from the normal course of development has led to one consequence which is of practical importance. It is no longer possible to restrict the practice of psycho-analysis to doctors and to exclude laymen from it. In fact, a doctor who has not been through a special training is, in spite of his diploma, a layman in analysis, and a non-doctor who has been suitably trained can, with occasional reference to a doctor, carry out the analytic treatment not only of children but also of neurotics.

¹ (*Footnote added 1935:*) Since these words were written child analysis in particular has gained a powerful momentum owing to the work of Mrs. Melanie Klein and of my daughter, Anna Freud.

By a process of development against which it would have been useless to struggle, the word 'psycho-analysis' has itself become ambiguous. While it was originally the name of a particular therapeutic method, it has now also become the name of a science - the science of unconscious mental processes. By itself this science is seldom able to deal with a problem completely, but it seems destined to give valuable contributory help in the most varied regions of knowledge. The sphere of application of psycho-analysis extends as far as that of psychology, to which it forms a complement of the greatest moment.

Looking back, then, over the patchwork of my life's labours, I can say that I have made many beginnings and thrown out many suggestions. Something will come of them in the future, though I cannot myself tell whether it will be much or little. I can, however, express a hope that I have opened up a pathway for an important advance in our knowledge.

POSTSCRIPT
(1935)

The editor of this series of autobiographical studies did not, so far as I know, consider the possibility that after a certain lapse of time a sequel might be written to any of them; and it may be that such an event has occurred only in the present instance. I am undertaking the task since my American publisher desires to issue the little work in a new edition. It first appeared in America in 1927 (published by Brentano) under the title of *An Autobiographical Study*, but it was injudiciously brought out in the same volume as another essay of mine which gave its title, *The Problem of Lay-Analyses*, to the whole book and so obscured the present work.

Two themes run through these pages: the story of my life and the history of psycho-analysis. They are intimately interwoven. This *Autobiographical Study* shows how psycho-analysis came to be the whole content of my life and rightly assumes that no personal experiences of mine are of any interest in comparison to my relations with that science.

Shortly before I wrote this study it seemed as though my life would soon be brought to an end by the recurrence of a malignant disease; but surgical skill saved me in 1923 and I was able to continue my life and my work, though no longer in freedom from pain. In the period of more than ten years that has passed since then, I have never ceased my analytic work nor my writing - as is proved by the completion of the twelfth volume of the German edition of my collected works. But I myself find that a significant change has come about. Threads which in the course of my development had become intertangled have now begun to separate; interests which I had acquired in the later part of my life have receded, while the older and original ones become prominent once more. It is true that in this last decade I have carried out some important pieces of analytic work, such as the revision of the problem of anxiety in my book *Inhibitions, Symptoms and Anxiety* (1926d) or the simple explanation of sexual 'fetishism' which I was able to make a year later (1927e). Nevertheless it would be true to say that, since I put forward my hypothesis of the existence of two classes of instinct (Eros and the death instinct) and since I proposed a division of the mental personality into an ego, a super-ego, and an id (1923b), I have made no further decisive contributions to psycho-analysis: what I have written on the subject since then has been either unessential or would soon have been supplied by someone else. This circumstance is connected with an alteration in myself, with what might be described as a phase of regressive development. My interest, after making a lifelong *détour* through the natural sciences, medicine and psychotherapy, returned to the cultural problems which had fascinated me long before, when I was a youth scarcely old enough for thinking. At the very climax of my psycho-analytic work, in 1912, I had already attempted in *Totem and Taboo* to make use of the newly discovered findings of analysis in order to investigate the origins of religion and morality. I now carried this work a stage further in two later essays, *The Future of an Illusion* (1927c) and *Civilization and its Discontents* (1930a). I perceived ever more clearly that the events of human history, the interactions between human nature, cultural development and the precipitates of primaeval experiences (the most prominent example of which is religion) are no more than a reflection of the dynamic conflicts between the ego, the id and the super-ego, which psycho-analysis studies in the individual - are the very same processes repeated upon a wider stage. In *The Future of an Illusion* I expressed an essentially negative valuation of religion. Later, I found a formula which did better justice to it: while granting that its power lies in the truth which it contains, I showed that that truth was not a material but a historical truth.

These studies, which, though they originate in psycho-analysis, stretch far beyond it, have perhaps awakened more public sympathy than psycho-analysis itself. They may have played a part in creating the short-lived illusion that I was among the writers to whom a great nation like Germany was ready to listen. It was in 1929 that, with words no less pregnant than friendly, Thomas Mann, one of the acknowledged spokesmen of the German people, found a place for me in the history of modern thought. A little later my daughter Anna, acting as my proxy, was given a civic reception in the Rathaus at Frankfort-on-Main on the occasion of my being awarded the Goethe Prize for 1930. This was the climax of my life as a citizen. Soon afterwards the boundaries of our country narrowed and the nation would know no more of us.

And here I may be allowed to break off these autobiographical notes. The public has no claim to learn any more of my personal affairs - of my struggles, my disappointments, and my successes. I have in any case been more open and frank in some of my writings (such as *The Interpretation of Dreams* and *The Psychopathology of Everyday Life*) than people usually are who describe their lives for their contemporaries or for posterity. I have had small thanks for it, and from my experience I cannot recommend anyone to follow my example.

I must add a few more words on the history of psycho-analysis during the last decade. There can no longer be any doubt that it will continue; it has proved its capacity to survive and to develop both as a branch of knowledge and as a therapeutic method. The number of its supporters (organized into the International Psycho-Analytical Association) has considerably increased. In addition to the older local groups (in Vienna, Berlin, Budapest, London, Holland, Switzerland, and Russia), societies have since been formed in Paris and Calcutta, two in Japan, several in the United States, and quite recently one each in Jerusalem and South Africa and two in Scandinavia. Out of their own funds these local societies support (or are in process of forming) training institutes, in which instruction in the practice of psycho-analysis is given according to a uniform plan, and out-patient clinics in which experienced analysts as well as students give free treatment to patients of limited means. Every other year the members of the International Psycho-Analytical Association hold a Congress at which scientific papers are read and questions of organization decided. The thirteenth of these congresses (which I myself can no longer attend) took place at Lucerne in 1934. From a core of interests that are common to all members of the Association, their work radiates in many different directions. Some lay most stress upon clarifying and deepening our knowledge of psychology, while others are concerned with keeping in contact with medicine and psychiatry. From the practical point of view, some analysts have set themselves the task of bringing about the recognition of psycho-analysis at the universities and its inclusion in the medical curriculum, whereas others are content to remain outside these institutions and will not allow that psycho-analysis is less important in the field of education than in that of medicine. It happens from time to time that an analytic worker may find himself isolated in an attempt to emphasize some single one of the findings or views of psycho-analysis at the expense of all the rest. Nevertheless, the whole impression is a satisfactory one - of serious scientific work carried on at a high level.

INHIBITIONS, SYMPTOMS AND ANXIETY
(1926)

Intentionally left blank

INHIBITIONS, SYMPTOMS AND ANXIETY

I

In the description of pathological phenomena, linguistic usage enables us to distinguish symptoms from inhibitions, without, however, attaching much importance to the distinction. Indeed, we might hardly think it worth while to differentiate exactly between the two, were it not for the fact that we meet with illnesses in which we observe the presence of inhibitions but not of symptoms and are curious to know the reason for this.

The two concepts are not upon the same plane. Inhibition has a special relation to function. It does not necessarily have a pathological implication. One can quite well call a normal restriction of a function an inhibition of it. A symptom, on the other hand, actually denotes the presence of some pathological process. Thus, an inhibition may be a symptom as well. Linguistic usage, then, employs the word *inhibition* when there is a simple lowering of function, and *symptom* when a function has undergone some unusual change or when a new phenomenon has arisen out of it. Very often it seems to be quite an arbitrary matter whether we emphasize the positive side of a pathological process and call its outcome a symptom, or its negative side and call its outcome an inhibition. But all this is really of little interest; and the problem as we have stated it does not carry us very far.

Since the concept of inhibition is so intimately associated with that of function, it might be helpful to examine the various functions of the ego with a view to discovering the forms which any disturbance of those functions assumes in each of the different neurotic affections. Let us pick out for a comparative study of this kind the sexual function and those of eating, of locomotion and of professional work.

(a) The sexual function is liable to a great number of disturbances, most of which exhibit the characteristics of simple inhibitions. These are classed together as psychical impotence. The normal performance of the sexual function can only come about as the result of a very complicated process, and disturbances may appear at any point in it. In men the chief stages at which inhibition occurs are shown by: a turning away of the libido at the very beginning of the process (psychical unpleasure); an absence of the physical preparation for it (lack of erection); an abridgement of the sexual act (*ejaculatio praecox*), an occurrence which might equally well be regarded as a symptom; an arrest of the act before it has reached its natural conclusion (absence of ejaculation); or a non-appearance of the psychical outcome (lack of the feeling of pleasure in orgasm). Other disturbances arise from the sexual function becoming dependent on special conditions of a perverse or fetishist nature.

That there is a relationship between inhibition and anxiety is pretty evident. Some inhibitions obviously represent a relinquishment of a function because its exercise would produce anxiety. Many women are openly afraid of the sexual function. We class this anxiety under hysteria, just as we do the defensive symptom of disgust which, arising originally as a deferred reaction to the experiencing of a passive sexual act, appears later whenever the *idea* of such an act is presented. Furthermore, many obsessional acts turn out to be measures of precaution and security against sexual experiences and are thus of a phobic character.

This is not very illuminating. We can only note that disturbances of the sexual function are brought about by a great variety of means. (1) The libido may simply be turned away (this seems most readily to produce what we regard as an inhibition pure and simple); (2) the function may be less well carried out; (3) it may be hampered by having conditions attached to it, or modified by being diverted to other aims; (4) it may be prevented by security measures; (5) if it cannot be prevented from starting, it may be immediately interrupted by the appearance of anxiety; and (6), if it is nevertheless carried out, there may be a subsequent reaction of protest against it and an attempt to undo what has been done.

(b) The function of nutrition is most frequently disturbed by a disinclination to eat, brought about by a withdrawal of libido. An increase in the desire to eat is also a not uncommon thing. The compulsion to eat is attributed to a fear of starving; but this is a subject which has been but little studied. The symptom of vomiting is known to us as a hysterical defence against eating. Refusal to eat owing to anxiety is a concomitant of psychotic states (delusions of being poisoned).

(c) In some neurotic conditions locomotion is inhibited by a disinclination to walk or a weakness in walking. In hysteria there will be a paralysis of the motor apparatus, or this one special function of the apparatus will be abolished (abasia). Especially characteristic are the increased difficulties that appear in locomotion owing to the introduction of certain stipulations whose non-observance results in anxiety (phobia).

(d) In inhibition in work - a thing which we so often have to deal with as an isolated symptom in our therapeutic work - the subject feels a decrease in his pleasure in it or becomes less able to do it well; or he has certain reactions to it, like fatigue, giddiness or sickness, if he is obliged to go on with it. If he is a hysteric he will have to give up his work owing to the appearance of organic and functional paralyses which make it impossible for him to carry it on. If he is an obsessional neurotic he will be perpetually being distracted from his work or losing time over it through the introduction of delays and repetitions.

Our survey might be extended to other functions as well; but there would be nothing more to be learnt by doing so. For we should not penetrate below the surface of the phenomena presented to us. Let us then proceed to describe inhibition in such a way as to leave very little doubt about what is meant by it, and say that inhibition is the expression of a *restriction of an ego-function*. A restriction of this kind can itself have very different causes. Some of the mechanisms involved in this renunciation of function are well known to us, as is a certain general purpose which governs it.

This purpose is more easily recognizable in the *specific* inhibitions. Analysis shows that when activities like playing the piano, writing or even walking are subjected to neurotic inhibitions it is because the physical organs brought into play - the fingers or the legs - have become too strongly erotized. It has been discovered as a general fact that the ego-function of an organ is impaired if its erotogenicity - its sexual significance - is increased. It behaves, if I may be allowed a rather absurd analogy, like a maid-servant who refuses to go on cooking because her master has started a love-affair with her. As soon as writing, which entails making a liquid flow out of a tube on to a piece of white paper, assumes the significance of copulation, or as soon as walking becomes a symbolic substitute for treading upon the body of mother earth, both writing and walking are stopped because they represent the performance of a forbidden sexual act. The ego renounces these functions, which are within its sphere, in order not to have to undertake fresh measures of repression - *in order to avoid a conflict with the id*.

There are clearly also inhibitions which serve the purpose of self-punishment. This is often the case in inhibitions of professional activities. The ego is not allowed to carry on those activities, because they would bring success and gain, and these are things which the severe super-ego has forbidden. So the ego gives them up too, *in order to avoid coming into conflict with the super-ego*.

The more *generalized* inhibitions of the ego obey a different mechanism of a simple kind. When the ego is involved in a particularly difficult psychical task, as occurs in mourning, or when there is some tremendous suppression of affect or when a continual flood of sexual phantasies has to be kept down, it loses so much of the energy at its disposal that it has to cut down the expenditure of it at many points at once. It is in the position of a speculator whose money has become tied up in his various enterprises. I came across an instructive example of this kind of intense, though short-lived, general inhibition. The patient, an obsessional neurotic, used to be overcome by a paralysing fatigue which lasted for one or more days whenever something occurred which should obviously have thrown him into a rage. We have here a point from which it should be possible to reach an understanding of the condition of general inhibition which characterizes states of depression, including the gravest form of them, melancholia.

As regards inhibitions, then, we may say in conclusion that they are restrictions of the functions of the ego which have been either imposed as a measure of precaution or brought about as a result of an impoverishment of energy; and we can see without difficulty in what respect an inhibition differs from a symptom: for a symptom cannot any longer be described as a process that takes place within, or acts upon, the ego.

II

The main characteristics of the formation of symptoms have long since been studied and, I hope, established beyond dispute. A symptom is a sign of, and a substitute for, an instinctual satisfaction which has remained in abeyance; it is a consequence of the process of repression. Repression proceeds from the ego when the latter - it may be at the behest of the super-ego - refuses to associate itself with an instinctual cathexis which has been aroused in the id. The ego is able by means of repression to keep the idea which is the vehicle of the reprehensible impulse from becoming conscious. Analysis shows that the idea often persists as an unconscious formation.

So far everything seems clear; but we soon come upon difficulties which have not as yet been solved. Up till now our account of what occurs in repression has laid great stress on this point of exclusion from consciousness. But it has left other points open to uncertainty. One question that arose was, what happened to the instinctual impulse which had been activated in the id and which sought satisfaction? The answer was an indirect one. It was that owing to the process of repression the pleasure that would have been expected from satisfaction had been transformed into unpleasure. But we were then faced with the problem of how the satisfaction of an instinct could produce unpleasure. The whole matter can be clarified, I think, if we commit ourselves to the definite statement that as a result of repression the intended course of the excitatory process in the id does not occur at all; the ego succeeds in inhibiting or deflecting it. If this is so the problem of 'transformation of affect' under repression disappears. At the same time this view implies a concession to the ego that it can exert a very extensive influence over processes in the id, and we shall have to find out in what way it is able to develop such surprising powers.

It seems to me that the ego obtains this influence in virtue of its intimate connections with the perceptual system - connections which, as we know, constitute its essence and provide the basis of its differentiation from the id. The function of this system, which we have called *Pcpt.-Cs.*, is bound up with the phenomenon of consciousness. It receives excitations not only from outside but from within, and endeavours, by means of the sensations of pleasure and unpleasure which reach it from these quarters, to direct the course of mental events in accordance with the pleasure principle. We are very apt to think of the ego as powerless against the id; but when it is opposed to an instinctual process in the id it has only to give a '*signal of unpleasure*' in order to attain its object with the aid of that almost omnipotent institution, the pleasure principle. To take this situation by itself for a moment, we can illustrate it by an example from another field. Let us imagine a country in which a certain small faction objects to a proposed measure the passage of which would have the support of the masses. This minority obtains command of the press and by its help manipulates the supreme arbiter, 'public opinion', and so succeeds in preventing the measure from being passed.

But this explanation opens up fresh problems. Where does the energy come from which is employed for giving the signal of unpleasure? Here we may be assisted by the idea that a defence against an unwelcome *internal* process will be modelled upon the defence adopted against an *external* stimulus, that the ego wards off internal and external dangers alike along identical lines. In the case of external danger the organism has recourse to attempts at flight. The first thing it does is to withdraw cathexis from the perception of the dangerous object; later on it discovers that it is a better plan to perform muscular movements of such a sort as will render perception of the dangerous object impossible even in the absence of any refusal to perceive it - that it is a better plan, that is, to remove itself from the sphere of danger. Repression is an equivalent of this attempt at flight. The ego withdraws its (preconscious) cathexis from the instinctual representative that is to be repressed and uses that cathexis for the purpose of releasing unpleasure (anxiety). The problem of how anxiety arises in connection with repression may be no simple one; but we may legitimately hold firmly to the idea that the ego is the actual seat of anxiety and give up our earlier view that the cathectic energy of the repressed impulse is automatically turned into anxiety. If I expressed myself earlier in the latter sense, I was giving a phenomenological description and not a metapsychological account of what was occurring.

This brings us to a further question: how is it possible, from an economic point of view, for a mere process of withdrawal and discharge, like the withdrawing of a preconscious ego-cathexis, to produce unpleasure or anxiety, seeing that, according to our assumptions, unpleasure and anxiety can only arise as a result of an *increase* in cathexis? The reply is that this causal sequence should not be explained from an economic point of view. Anxiety is not newly created in repression; it is reproduced as an affective state in accordance with an already existing mnemic image. If we go further and enquire into the origin of that anxiety - and of affects in general - we shall be leaving the realm of pure psychology and entering the borderland of physiology. Affective states have become incorporated in the mind as precipitates of primaeval traumatic experiences, and when a similar situation occurs they are revived like mnemic symbols. I do not think I have been wrong in likening them to the more recent and individually acquired hysterical attack and in regarding them as its normal prototypes. In man and the higher animals it would seem that the act of birth, as the individual's first experience of anxiety, has given the affect of anxiety certain characteristic forms of expression. But, while acknowledging this connection, we must not lay undue stress on it nor overlook the fact that biological necessity demands that a situation of danger should have an affective symbol, so that a symbol of this kind would have to be created in any case. Moreover, I do not think that we are justified in assuming that whenever there is an outbreak of anxiety something like a reproduction of the situation of birth goes on in the mind. It is not even certain whether hysterical attacks, though they were originally traumatic reproductions of this sort, retain that character permanently.

As I have shown elsewhere, most of the repressions with which we have to deal in our therapeutic work are cases of *after-pressure*. They presuppose the operation of earlier, *primal repressions* which exert an attraction on the more recent situation. Far too little is known as yet about the background and preliminary stages of repression. There is a danger of over-estimating the part played in repression by the super-ego. We cannot at present say whether it is perhaps the emergence of the super-ego which provides the line of demarcation between primal repression and after-pressure. At any rate, the earliest outbreaks of anxiety, which are of a very intense kind, occur before the super-ego has become differentiated. It is highly probable that the immediate precipitating causes of primal repressions are quantitative factors such as an excessive degree of excitation and the breaking through of the protective shield against stimuli.

This mention of the protective shield sounds a note which recalls to us the fact that repression occurs in two different situations - namely, when an undesirable instinctual impulse is aroused by some external perception, and when it arises internally without any such provocation. We shall return to this difference later. But the protective shield exists only in regard to external stimuli, not in regard to internal instinctual demands.

So long as we direct our attention to the ego's attempt at flight we shall get no nearer to the subject of symptom-formation. A symptom arises from an instinctual impulse which has been detrimentally affected by repression. If the ego, by making use of the signal of unpleasure, attains its object of completely suppressing the instinctual impulse, we learn nothing of how this has happened. We can only find out about it from those cases in which repression must be described as having to a greater or less extent failed. In this event the position, generally speaking, is that the instinctual impulse has found a substitute in spite of repression, but a substitute which is very much reduced, displaced and inhibited and which is no longer recognizable as a satisfaction. And when the substitutive impulse is carried out there is no sensation of pleasure; its carrying out has, instead, the quality of a compulsion.

In thus degrading a process of satisfaction to a symptom, repression displays its power in a further respect. The substitutive process is prevented, if possible, from finding discharge through motility; and even if this cannot be done, the process is forced to expend itself in making alterations in the subject's own body and is not permitted to impinge upon the external world. It must not be transformed into action. For, as we know, in repression the ego is operating under the influence of external reality and therefore it debar the substitutive process from having any effect upon that reality.

Just as the ego controls the path to action in regard to the external world, so it controls access to consciousness. In repression it exercises its power in both directions, acting in the one manner upon the instinctual impulse itself and in the other upon the representative of that impulse. At this point it is relevant to ask how I can reconcile this acknowledgement of the might of the ego with the description of its position which I gave in *The Ego and the Id*. In that book I drew a picture of its dependent relationship to the id and to the super-ego and revealed how powerless and apprehensive it was in regard to both and with what an effort it maintained its show of superiority over them. This view has been widely echoed in psycho-analytic literature. Many writers have laid much stress on the weakness of the ego in relation to the id and of our rational elements in the face of the daemonic forces within us; and they display a strong tendency to make what I have said into a corner-stone of a psycho-analytic *Weltanschauung*. Yet surely the psycho-analyst, with his knowledge of the way in which repression works, should, of all people, be restrained from adopting such an extreme and one-sided view.

I must confess that I am not at all partial to the fabrication of *Weltanschauungen*. Such activities may be left to philosophers, who avowedly find it impossible to make their journey through life without a Baedeker of that kind to give them information on every subject. Let us humbly accept the contempt with which they look down on us from the vantage-ground of their superior needs. But since we cannot forgo our narcissistic pride either, we will draw comfort from the reflection that such 'Handbooks to Life' soon grow out of date and that it is precisely our short-sighted, narrow and finicky work which obliges them to appear in new editions, and that even the most up-to-date of them are nothing but attempts to find a substitute for the ancient, useful and all-sufficient Church Catechism. We know well enough how little light science has so far been able to throw on the problems that surround us. But however much ado the philosophers may make, they cannot alter the situation. Only patient, persevering research, in which everything is subordinated to the one requirement of certainty, can gradually bring about a change. The benighted traveller may sing aloud in the dark to deny his own fears; but, for all that, he will not see an inch further beyond his nose.

III

To return to the problem of the ego. The apparent contradiction is due to our having taken abstractions too rigidly and attended exclusively now to the one side and now to the other of what is in fact a complicated state of affairs. We were justified, I think, in dividing the ego from the id, for there are certain considerations which necessitate that step. On the other hand the ego is identical with the id, and is merely a specially differentiated part of it. If we think of this part by itself in contradistinction to the whole, or if a real split has occurred between the two, the weakness of the ego becomes apparent. But if the ego remains bound up with the id and indistinguishable from it, then it displays its strength. The same is true of the relation between the ego and the super-ego. In many situations the two are merged; and as a rule we can only distinguish one from the other when there is a tension or conflict between them. In repression the decisive fact is that the ego is an organization and the id is not. The ego is, indeed, the organized portion of the id. We should be quite wrong if we pictured the ego and the id as two opposing camps and if we supposed that, when the ego tries to suppress a part of the id by means of repression, the remainder of the id comes to the rescue of the endangered part and measures its strength with the ego. This may often be what happens, but it is certainly not the initial situation in repression. As a rule the instinctual impulse which is to be repressed remains isolated. Although the act of repression demonstrates the strength of the ego, in one particular it reveals the ego's powerlessness and how impervious to influence are the separate instinctual impulses of the id. For the mental process which has been turned into a symptom owing to repression now maintains its existence outside the organization of the ego and independently of it. Indeed, it is not that process alone but all its derivatives which enjoy, as it were, this same privilege of extra-territoriality; and whenever they come into associative contact with a part of the ego-organization, it is not at all certain that they will not draw that part over to themselves and thus enlarge themselves at the expense of the ego. An analogy with which we have long been familiar compared a symptom to a foreign body which was keeping up a constant succession of stimuli and reactions in the tissue in which it was embedded. It does sometimes happen that the defensive struggle against an unwelcome instinctual impulse is brought to an end with the formation of a symptom. As far as can be seen, this is most often possible in hysterical conversion. But usually the outcome is different. The initial act of repression is followed by a tedious or interminable sequel in which the struggle against the instinctual impulse is prolonged into a struggle against the symptom.

In this secondary defensive struggle the ego presents two faces with contradictory expressions. The one line of behaviour it adopts springs from the fact that its very nature obliges it to make what must be regarded as an attempt at restoration or reconciliation. The ego is an organization. It is based on the maintenance of free intercourse and of the possibility of reciprocal influence between all its parts. Its desexualized energy still shows traces of its origin in its impulsion to bind together and unify, and this necessity to synthesize grows stronger in proportion as the strength of the ego increases. It is therefore only natural that the ego should try to prevent symptoms from remaining isolated and alien by using every possible method to bind them to itself in one way or another, and to incorporate them into its organization by means of those bonds. As we know, a tendency of this kind is already operative in the very act of forming a symptom. A classical instance of this are those hysterical symptoms which have been shown to be a compromise between the need for satisfaction and the need for punishment. Such symptoms participate in the ego from the very beginning, since they fulfil a requirement of the super-ego, while on the other hand they represent positions occupied by the repressed and points at which an irruption has been made by it into the ego-organization. They are a kind of frontier-station with a mixed garrison. (Whether all primary hysterical symptoms are constructed on these lines would be worth enquiring into very carefully.) The ego now proceeds to behave as though it recognized that the symptom had come to stay and that the only thing to do was to accept the situation in good part and draw as much advantage from it as possible. It makes an adaptation to the symptom - to this piece of the internal world which is alien to it - just as it normally does to the real external world. It can always find plenty of opportunities for doing so. The presence of a symptom may entail a certain impairment of capacity, and this can be exploited to appease some demand on the part of the super-ego or to refuse some claim from the external world. In this way the symptom gradually comes to be the representative of important interests; it is found to be useful in asserting the position of the self and becomes more and more closely merged with the ego and more and more indispensable to it. It is only very rarely that the physical process of 'healing' round a foreign body follows such a course as this. There is a danger, too, of exaggerating the importance of a secondary adaptation of this kind to a symptom, and of saying that the ego has created the symptom merely in order to enjoy its advantages. It would be equally true to say that a man who had lost his leg in the war had got it shot away so that he might thenceforward live on his pension without having to do any more work.

In obsessional neurosis and paranoia the forms which the symptoms assume become very valuable to the ego because they obtain for it, not certain advantages, but a narcissistic satisfaction which it would otherwise be without. The systems which the obsessional neurotic constructs flatter his self-love by making him feel that he is better than other people because he is specially cleanly or specially conscientious. The delusional constructions of the paranoic offer to his acute perceptive and imaginative powers a field of activity which he could not easily find elsewhere.

All of this results in what is familiar to us as the '(secondary) gain from illness' which follows a neurosis. This gain comes to the assistance of the ego in its endeavour to incorporate the symptom and increases the symptom's fixation. When the analyst tries subsequently to help the ego in its struggle against the symptom, he finds that these conciliatory bonds between ego and symptom operate on the side of the resistances and that they are not easy to loosen.

The two lines of behaviour which the ego adopts towards the symptom are in fact directly opposed to each other. For the other line is less friendly in character, since it continues in the direction of repression. Nevertheless the ego, it appears, cannot be accused of inconsistency. Being of a peaceable disposition it would like to incorporate the symptom and make it part of itself. It is from the symptom itself that the trouble comes. For the symptom, being the true substitute for and derivative of the repressed impulse, carries on the role of the latter; it continually renews its demands for satisfaction and thus obliges the ego in its turn to give the signal of unpleasure and put itself in a posture of defence.

The secondary defensive struggle against the symptom takes many shapes. It is fought out on different fields and makes use of a variety of methods. We shall not be able to say much about it until we have made an enquiry into the various different instances of symptom-formation. In doing this we shall have an opportunity of going into the problem of anxiety - a problem which has long been looming in the background. The wisest plan will be to start from the symptoms produced by the hysterical neurosis; for we are not as yet in a position to consider the conditions in which the symptoms of obsessional neurosis, paranoia and other neuroses are formed.

IV

Let us start with an infantile hysterical phobia of animals - for instance, the case of 'Little Hans', whose phobia of horses was undoubtedly typical in all its main features. The first thing that becomes apparent is that in a concrete case of neurotic illness the state of affairs is much more complex than one would suppose so long as one was dealing with abstractions. It takes a little time to find one's bearings and to decide which the repressed impulse is, what substitutive symptom it has found and where the motive for repression lies.

'Little Hans' refused to go out into the street because he was afraid of horses. This was the raw material of the case. Which part of it constituted the symptom? Was it his having the fear? Was it his choice of an object for his fear? Was it his giving up of his freedom of movement? Or was it more than one of these combined? What was the satisfaction which he renounced? And why did he have to renounce it?

At a first glance one is tempted to reply that the case is not so very obscure. 'Little Hans's' unaccountable fear of horses was the symptom and his inability to go out into the streets was an inhibition, a restriction which his ego had imposed on itself so as not to arouse the anxiety-symptom. The second point is clearly correct; and in the discussion which follows I shall not concern myself any further with this inhibition. But as regards the alleged symptom, a superficial acquaintance with the case does not even disclose its true formulation. For further investigation shows that what he was suffering from was not a vague fear of horses but a quite definite apprehension that a horse was going to bite him. This idea, indeed, was endeavouring to withdraw from consciousness and get itself replaced by an undefined phobia in which only the anxiety and its object still appeared. Was it perhaps this idea that was the nucleus of his symptom?

We shall not make any headway until we have reviewed the little boy's psychical situation as a whole as it came to light in the course of the analytic treatment. He was at the time in the jealous and hostile Oedipus attitude towards his father, whom nevertheless - except in so far as his mother was the cause of estrangement - he dearly loved. Here, then, we have a conflict due to ambivalence: a well-grounded love and a no less justifiable hatred directed towards one and the same person. 'Little Hans's' phobia must have been an attempt to solve this conflict. Conflicts of this kind due to ambivalence are very frequent and they can have another typical outcome, in which one of the two conflicting feelings (usually that of affection) becomes enormously intensified and the other vanishes. The exaggerated degree and compulsive character of the affection alone betray the fact that it is not the only one present but is continually on the alert to keep the opposite feeling under suppression, and enable us to postulate the operation of a process which we call repression by means of *reaction-formation* (in the ego). Cases like 'Little Hans's' show no traces of a reaction-formation of this kind. There are clearly different ways of egress from a conflict due to ambivalence.

Meanwhile we have been able to establish another point with certainty. The instinctual impulse which underwent repression in 'Little Hans' was a hostile one against his father. Proof of this was obtained in his analysis while the idea of the biting horse was being followed up. He had seen a horse fall down and he had also seen a playmate, with whom he was playing at horses, fall down and hurt himself. Analysis justified the inference that he had a wishful impulse that his father should fall down and hurt himself as his playmate and the horse had done. Moreover, his attitude towards someone's departure on a certain occasion makes it probable that his wish that his father should be out of the way also found less hesitating expression. But a wish of this sort is tantamount to an intention of putting one's father out of the way oneself - is tantamount, that is, to the murderous impulse of the Oedipus complex.

So far there seem to be no connecting links between 'Little Hans's' repressed instinctual impulse and the substitute for it which we suspect is to be seen in his phobia of horses. Let us simplify his psychical situation by setting on one side the infantile factor and the ambivalence. Let us imagine that he is a young servant who is in love with the mistress of the house and has received some tokens of her favour. He hates his master, who is more powerful than he is, and he would like to have him out of the way. It would then be eminently natural for him to dread his master's vengeance and to develop a fear of him - just as 'Little Hans' developed a phobia of horses. We cannot, therefore, describe the fear belonging to this phobia as a symptom. If 'Little Hans', being in love with his mother, had shown fear of his father, we should have no right to say that he had a neurosis or a phobia. His emotional reaction would have been entirely comprehensible. What made it a neurosis was one thing alone: the replacement of his father by a horse. It is this displacement, then, which has a claim to be called a symptom, and which, incidentally, constitutes the alternative mechanism which enables a conflict due to ambivalence to be resolved without the aid of a reaction-formation. Such a displacement is made possible or facilitated at 'Little Hans's' early age because the inborn traces of totemic thought can still be easily revived. Children do not as yet recognize or, at any rate, lay such exaggerated stress upon the gulf that separates human beings from the animal world. In their eyes the grown man, the object of their fear and admiration, still belongs to the same category as the big animal who has so many enviable attributes but against whom they have been warned because he may become dangerous. As we see, the conflict due to ambivalence is not dealt with in relation to one and the same person: it is circumvented, as it were, by one of the pair of conflicting impulses being directed to another person as a substitutive object.

So far everything is clear. But the analysis of 'Hans's' phobia has been a complete disappointment in one respect. The distortion which constituted the symptom-formation was not applied to the representative (the ideational content) of the instinctual impulse that was to be repressed; it was applied to a quite different representative and one which only corresponded to a *reaction* to the disagreeable instinct. It would be more in accordance with our expectations if 'Little Hans' had developed, instead of a fear of horses, as inclination to ill-treat them and to beat them or if he had expressed in plain terms a wish to see them fall down or be hurt or even die in convulsions ('make a row with their feet'). Something of the sort did in fact emerge in his analysis, but it was not by any means in the forefront of his neurosis. And, curiously enough, if he really had produced a hostility of this sort not against his father but against horses as his main symptom, we should not have said that he was suffering from a neurosis. There must be something wrong either with our view of repression or with our definition of a symptom. One thing, of course, strikes us at once: if 'Little Hans' had really behaved like that to horses, it would mean that repression had in no way altered the character of his objectionable and aggressive instinctual impulse itself but only the object towards which it was directed.

Undoubtedly there are cases in which this is all that repression does. But more than this happened in the development of 'Little Hans's' phobia - how much more can be guessed from a part of another analysis.

As we know, 'Little Hans' alleged that what he was afraid of was that a horse would bite him. Now some time later I was able to learn something about the origin of another animal phobia. In this instance the dreaded animal was a wolf; it, too, had the significance of a father-substitute. As a boy the patient in question - a Russian whom I did not analyse till he was in his twenties - had had a dream (whose meaning was revealed in analysis) and, immediately after it, had developed a fear of being devoured by a wolf, like the seven little goats in the fairy tale. ¹ In the case of 'Little Hans' the ascertained fact that his father used to play at horses with him doubtless determined his choice of a horse as his anxiety-animal. In the same way it appeared at least highly probable that the father of my Russian patient used, when playing with him, to pretend to be a wolf and jokingly threaten to gobble him up. Since then I have come across a third instance. The patient was a young American who came to me for analysis. He did not, it is true, develop an animal phobia, but it is precisely because of this omission that his case helps to throw light upon the other two. As a child he had been sexually excited by a fantastic children's story which had been read aloud to him about an Arab chief who pursued a 'ginger-bread man' so as to eat him up. He identified himself with this edible person, and the Arab chief was easily recognizable as a father-substitute. This phantasy formed the earliest substratum of his auto-erotic phantasies.

¹ 'From the History of an Infantile Neurosis' (1918b).

The idea of being devoured by the father is typical age-old childhood material. It has familiar parallels in mythology (e.g. the myth of Kronos) and in the animal kingdom. Yet in spite of this confirmation the idea is so strange to us that we can hardly credit its existence in a child. Nor do we know whether it really means what it seems to say, and we cannot understand how it can have become the subject of a phobia. Analytic observation supplies the requisite information. It shows that the idea of being devoured by the father gives expression, in a form that has undergone regressive degradation, to a passive, tender impulse to be loved by him in a genital-erotic sense. Further investigation of the case history leaves no doubt of the correctness of this explanation. The genital impulse, it is true, betrays no sign of its tender purpose when it is expressed in the language belonging to the superseded transitional phase between the oral and sadistic organizations of the libido. Is it, moreover, a question merely of the replacement of the representative by a regressive form of expression or is it a question of a genuine regressive degradation of the genitally-directed impulse in the id? It is not at all easy to make certain. The case history of the Russian 'Wolf Man' gives very definite support to the second, more serious, view; for, from the time of the decisive dream onward, the boy became naughty, tormenting and sadistic, and soon afterwards developed a regular obsessional neurosis. At any rate, we can see that repression is not the only means which the ego can employ for the purpose of defence against an unwelcome instinctual impulse. If it succeeds in making an instinct regress, it will actually have done it more injury than it could have by repressing it. Sometimes, indeed, after forcing an instinct to regress in this way, it goes on to repress it.

The case of the 'Wolf Man' and the somewhat less complicated one of 'Little Hans' raise a number of further considerations. But we have already made two unexpected discoveries. There can be no doubt that the instinctual impulse which was repressed in both phobias was a hostile one against the father. One might say that that impulse had been repressed by the process of being transformed into its opposite. Instead of aggressiveness on the part of the subject towards his father, there appeared aggressiveness (in the shape of revenge) on the part of his father towards the subject. Since this aggressiveness is in any case rooted in the sadistic phase of the libido, only a certain amount of degradation is needed to reduce it to the oral stage. This stage, while only hinted at in 'Little Hans's' fear of being bitten, was blatantly exhibited in the 'Wolf Man's' terror of being devoured. But, besides this, the analysis has demonstrated, beyond a shadow of doubt, the presence of another instinctual impulse of an opposite nature which had succumbed to repression. This was a tender, passive impulse directed towards the father, which had already reached the genital (phallic) level of libidinal organization. As regards the final outcome of the process of repression, this impulse seems, indeed, to have been the more important of the two; it underwent a more far-reaching regression and had a decisive influence upon the content of the phobia. In following up a *single* instinctual repression we have thus had to recognize a convergence of *two* such processes. The two instinctual impulses that have been overtaken by repression - sadistic aggressiveness towards the father and a tender passive attitude to him - form a pair of opposites. Furthermore, a full appreciation of 'Little Hans's' case shows that the formation of his phobia had had the effect of abolishing his affectionate object-cathexis of his mother as well, though the actual content of his phobia betrayed no sign of this. The process of repression had attacked almost all the components of his Oedipus complex - both his hostile and his tender impulses towards his father and his tender impulses towards his mother. In my Russian patient this state of affairs was much less obvious.

These are unwelcome complications, considering that we only set out to study simple cases of symptom-formation due to repression, and with that intention selected the earliest and to all appearances, most transparent neuroses of childhood. Instead of a single repression we have found a collection of them and have become involved with regression into the bargain. Perhaps we have added to the confusion by treating the two cases of animal phobia at our disposal - 'Little Hans' and the 'Wolf Man' - as though they were cast in the same mould. As a matter of fact, certain differences between them stand out. It is only with regard to 'Little Hans' that we can say with certainty that what his phobia disposed of were the two main impulses of the Oedipus complex - his aggressiveness towards his father and his over-fondness for his mother. A tender feeling for his father was undoubtedly there too and played a part in repressing the opposite feeling; but we can prove neither that it was strong enough to draw repression upon itself nor that it disappeared afterwards. 'Hans' seems, in fact, to have been a normal boy with what is called a 'positive' Oedipus complex. It is possible that the factors which we do not find were actually at work in him, but we cannot demonstrate their existence. Even the most exhaustive analysis has gaps in its data and is insufficiently documented. In the case of the Russian the deficiency lies elsewhere. His attitude to female objects had been disturbed by an early seduction and his passive, feminine side was strongly developed. The analysis of his wolf-dream revealed very little intentional aggressiveness towards his father, but it brought forward unmistakable proof that what repression overtook was his passive tender attitude to his father. In his case, too, the other factors may have been operative as well; but they were not in evidence. How is it that, in spite of these differences in the two cases, almost amounting to an antithesis, the final outcome - a phobia - was approximately the same? The answer must be sought in another quarter. I think it will be found in the second fact which emerges from our brief comparative examination. It seems to me that in both cases we can detect what the motive force of the repression was and can substantiate our view of its nature from the line of development which the two children subsequently pursued. This motive force was the same in both of them. It was the fear of impending castration. 'Little Hans' gave up his aggressiveness towards his father from fear of being castrated. His fear that a horse would bite him can, without any forcing, be given the full sense of a fear that a horse would bite off his genitals, would castrate him. But it was from fear of being castrated, too, that the little Russian relinquished his wish to be loved by his father, for he thought that a relation of that sort presupposed a sacrifice of his genitals - of the organ which distinguished him from a female. As we see, both forms of the Oedipus complex, the normal, active form and the inverted one, came to grief through the castration complex. The Russian boy's anxiety-idea of being devoured by a wolf contained, it is true, no suggestion of castration, for the oral regression it had undergone had removed it too far from the phallic stage. But the analysis of his dream rendered further proof superfluous. It was a triumph of repression that the form in which his phobia was expressed should no longer have contained any allusion to castration.

Here, then, is our unexpected finding: in both patients the motive force of the repression was fear of castration. The ideas contained in their anxiety - being bitten by a horse and being devoured by a wolf - were substitutes by distortion for the idea of being castrated by their father. This was the idea which had undergone repression. In the Russian boy the idea was an expression of a wish which was not able to subsist in the face of his masculine revolt; in 'Little Hans' it was the expression of a reaction in him which had turned his aggressiveness into its opposite. But the *affect* of anxiety, which was the essence of the phobia, came, not from the process of repression, not from the libidinal cathexes of the repressed impulses, but from the repressing agency itself. The anxiety belonging to the animal phobias was an untransformed fear of castration. It was therefore a realistic fear, a fear of a danger which was actually impending or was judged to be a real one. It was anxiety which produced repression and not, as I formerly believed, repression which produced anxiety.

It is no use denying the fact, though it is not pleasant to recall it, that I have on many occasions asserted that in repression the instinctual representative is distorted, displaced and so on, while the libido belonging to the instinctual impulse is transformed into anxiety. But now an examination of phobias, which should be best able to provide confirmatory evidence, fails to bear out my assertion; it seems, rather, to contradict it directly. The anxiety felt in animal phobias is the ego's fear of castration; while the anxiety felt in agoraphobia (a subject that has been less thoroughly studied) seems to be its fear of sexual temptation - a fear which, after all, must be connected in its origins with the fear of castration. As far as can be seen at present, the majority of phobias go back to an anxiety of this kind felt by the ego in regard to the demands of the libido. It is always the ego's attitude of anxiety which is the primary thing and which sets repression going. Anxiety never arises from repressed libido. If I had contented myself earlier with saying that after the occurrence of repression a certain amount of anxiety appeared in place of the manifestation of libido that was to be expected, I should have nothing to retract to-day. The description would be correct; and there does undoubtedly exist a correspondence of the kind asserted between the strength of the impulse that has to be repressed and the intensity of the resultant anxiety. But I must admit that I thought I was giving more than a mere description. I believed I had put my finger on a metapsychological process of direct transformation of libido into anxiety. I can now no longer maintain this view. And, indeed, I found it impossible at the time to explain how a transformation of that kind was carried out.

It may be asked how I arrived at this idea of transformation in the first instance. It was while I was studying the 'actual neuroses', at a time when analysis was still a very long way from distinguishing between processes in the ego and processes in the id. I found that outbreaks of anxiety and a general state of preparedness for anxiety were produced by certain sexual practices such as *coitus interruptus*, undischarged sexual excitation or enforced abstinence - that is, whenever sexual excitation was inhibited, arrested or deflected in its progress towards satisfaction. Since sexual excitation was an expression of libidinal instinctual impulses it did not seem too rash to assume that the libido was turned into anxiety through the agency of these disturbances. The observations which I made at the time still hold good. Moreover, it cannot be denied that the libido belonging to the id-processes is subjected to disturbance at the instigation of repression. It might still be true, therefore, that in repression anxiety is produced from the libidinal cathexis of the instinctual impulses. But how can we reconcile this conclusion with our other conclusion that the anxiety felt in phobias is an ego anxiety and arises in the ego, and that it does not proceed out of repression but, on the contrary, sets repression in motion? There seems to be a contradiction here which it is not at all a simple matter to solve. It will not be easy to reduce the two sources of anxiety to a single one. We might attempt to do so by supposing that, when coitus is disturbed or sexual excitation interrupted or abstinence enforced, the ego scents certain dangers to which it reacts with anxiety. But this takes us nowhere. On the other hand, our analysis of the phobias seems to admit of no correction. *Non liquet*.

V

We set out to study the formation of symptoms and the secondary struggle waged by the ego against symptoms. But in picking on the phobias for this purpose we have clearly made an unlucky choice. The anxiety which predominates in the picture of these disorders is now seen as a complication which obscures the situation. There are plenty of neuroses which exhibit no anxiety whatever. True conversion hysteria is one of these. Even in its most severe symptoms no admixture of anxiety is found. This fact alone ought to warn us against making too close a connection between anxiety and symptom-formation. The phobias are so closely akin to conversion hysteria in every other respect that I have felt justified in classing them alongside of it under the name of 'anxiety hysteria'. But no one has as yet been able to say what it is that determines whether any given case shall take the form of a conversion hysteria or a phobia - has been able, that is to say, to establish what determines the generating of anxiety in hysteria.

The commonest symptoms of conversion hysteria - motor paralyses, contractures, involuntary actions or discharges, pains and hallucinations - are cathectic processes which are either permanently maintained or intermittent. But this puts fresh difficulties in the way. Not much is actually known about these symptoms. Analysis can show what the disturbed excitatory process is which the symptoms replace. It usually turns out that they themselves have a share in that process. It is as though the whole energy of the process had been concentrated in this one part of it. For instance, it will be found that the pains from which a patient suffers were present in the situation in which the repression occurred; or that his hallucination was, at that time, a perception; or that his motor paralysis is a defence against an action which should have been performed in that situation but was inhibited; or that his contracture is usually a displacement of an intended innervation of the muscles in some other part of his body; or that his convulsions are the expression of an outburst of affect which has been withdrawn from the normal control of the ego. The sensation of unpleasure which accompanies the appearance of the symptoms varies in a striking degree. In chronic symptoms which have been displaced on to motility, like paralyses and contractures, it is almost always entirely absent; the ego behaves towards the symptoms as though it had nothing to do with them. In intermittent symptoms and in those concerned with the sensory sphere, sensations of unpleasure are as a rule distinctly felt; and in symptoms of pain these may reach an extreme degree. The picture presented is so manifold that it is difficult to discover the factor which permits of all these variations and yet allows a uniform explanation of them. There is, moreover, little to be seen in conversion hysteria of the ego's struggle against the symptom after it has been formed. It is only when sensitivity to pain in some part of the body constitutes the symptom that that symptom is in a position to play a dual role. The symptom of pain will appear no less regularly whenever the part of the body concerned is touched from outside than when the pathogenic situation which it represents is associatively activated from within; and the ego will take precautions to prevent the symptom from being aroused through external perceptions. Why the formation of symptoms in conversion hysteria should be such a peculiarly obscure thing I cannot tell; but the fact affords us a good reason for quitting such an unproductive field of enquiry without delay.

Let us turn to the obsessional neuroses in the hope of learning more about the formation of symptoms. The symptoms belonging to this neurosis fall, in general, into two groups, each having an opposite trend. They are either prohibitions, precautions and expiations - that is, negative in character - or they are, on the contrary, substitutive satisfactions which often appear in symbolic disguise. The negative, defensive group of symptoms is the older of the two; but as illness is prolonged, the satisfactions, which scoff at all defensive measures, gain the upper hand. The symptom-formation scores a triumph if it succeeds in combining the prohibition with satisfaction so that what was originally a defensive command or prohibition acquires the significance of a satisfaction as well; and in order to achieve this end it will often make use of the most ingenious associative paths. Such an achievement demonstrates the tendency of the ego to synthesize, which we have already observed. In extreme cases the patient manages to make most of his symptoms acquire, in addition to their original meaning, a directly contrary one. This is a tribute to the power of ambivalence, which, for some unknown reason, plays such a large part in obsessional neuroses. In the crudest instance the symptom is diphasic: an action which carries out a certain injunction is immediately succeeded by another action which stops or undoes the first one even if it does not go quite so far as to carry out its opposite.

Two impressions at once emerge from this brief survey of obsessional symptoms. The first is that a ceaseless struggle is being waged against the repressed, in which the repressing forces steadily lose ground; the second is that the ego and the super-ego have a specially large share in the formation of the symptoms.

Obsessional neurosis is unquestionably the most interesting and repaying subject of analytic research. But as a problem it has not yet been mastered. It must be confessed that, if we endeavour to penetrate more deeply into its nature, we still have to rely upon doubtful assumptions and unconfirmed suppositions. Obsessional neurosis originates, no doubt, in the same situation as hysteria, namely, the necessity of fending off the libidinal demands of the Oedipus complex. Indeed, every obsessional neurosis seems to have a substratum of hysterical symptoms that have been formed at a very early stage. But it is subsequently shaped along quite different lines owing to a constitutional factor. The genital organization of the libido turns out to be feeble and insufficiently resistant, so that when the ego begins its defensive efforts the first thing it succeeds in doing is to throw back the genital organization (of the phallic phase), in whole or in part, to the earlier sadistic-anal level. This fact of regression is decisive for all that follows.

Another possibility has to be considered. Perhaps regression is the result not of a constitutional factor but of a time-factor. It may be that regression is rendered possible not because the genital organization of the libido is too feeble but because the opposition of the ego begins too early, while the sadistic phase is at its height. I am not prepared to express a definite opinion on this point, but I may say that analytic observation does not speak in favour of such an assumption. It shows rather that, by the time an obsessional neurosis is entered upon, the phallic stage has already been reached. Moreover, the onset of this neurosis belongs to a later time of life than that of hysteria - to the second period of childhood, after the latency period has set in. In a woman patient whose case I was able to study and who was overtaken by this disorder at a very late date, it became clear that the determining cause of her regression and of the emergence of her obsessional neurosis was a real occurrence through which her genital life, which had up till then been intact, lost all its value.¹

¹ See my paper on 'The Disposition to Obsessional Neurosis' (1913/).

As regards the metapsychological explanation of regression, I am inclined to find it in a 'defusion of instinct', in a detachment of the erotic components which, with the onset of the genital stage, had joined the destructive cathexes belonging to the sadistic phase.

In enforcing regression, the ego scores its first success in its defensive struggle against the demands of the libido. (In this connection it is of advantage to distinguish the more general notion of 'defence' from 'repression'. Repression is only one of the mechanisms which defence makes use of.) It is perhaps in obsessional cases more than in normal or hysterical ones that we can most clearly recognize that the motive force of defence is the castration complex and that what is being fended off are the trends of the Oedipus complex. We are at present dealing with the beginning of the latency period, a period which is characterized by the dissolution of the Oedipus complex, the creation or consolidation of the super-ego and the erection of ethical and aesthetic barriers in the ego. In obsessional neuroses these processes are carried further than is normal. In addition to the destruction of the Oedipus complex a regressive degradation of the libido takes place, the super-ego becomes exceptionally severe and unkind, and the ego, in obedience to the super-ego, produces strong reaction-formations in the shape of conscientiousness, pity and cleanliness. Implacable, though not always on that account successful, severity is shown in condemning the temptation to continue early infantile masturbation, which now attaches itself to regressive (sadistic-anal) ideas but which nevertheless represents the unsubjected part of the phallic organization. There is an inherent contradiction about this state of affairs, in which, precisely in the interests of masculinity (that is to say, from fear of castration), every activity belonging to masculinity is stopped. But here, too, obsessional neurosis is only overdoing the normal method of getting rid of the Oedipus complex. We once more find here an illustration of the truth that every exaggeration contains the seed of its own undoing. For, under the guise of obsessional acts, the masturbation that has been suppressed approaches ever more closely to satisfaction.

The reaction-formations in the ego of the obsessional neurotic, which we recognize as exaggerations of normal character-formation, should be regarded, I think, as yet another mechanism of defence and placed alongside of regression and repression. They seem to be absent or very much weaker in hysteria. Looking back, we can now get an idea of what is peculiar to the defensive process in hysteria. It seems that in it the process is limited to repression alone. The ego turns away from the disagreeable instinctual impulse, leaves it to pursue its course in the unconscious, and takes no further part in its fortunes. This view cannot be absolutely correct, for we are acquainted with the case in which a hysterical symptom is at the same time a fulfilment of a penalty imposed by the super-ego; but it may describe a general characteristic of the behaviour of the ego in hysteria.

We can either simply accept it as a fact that in obsessional neurosis a super-ego of this severe kind emerges, or we can take the regression of the libido as the fundamental characteristic of the affection and attempt to relate the severity of the super-ego to it. And indeed the super-ego, originating as it does from the id, cannot dissociate itself from the regression and defusion of instinct which have taken place there. We cannot be surprised if it becomes harsher, unkindier and more tormenting than where development has been normal.

The chief task during the latency period seems to be the fending-off of the temptation to masturbate. This struggle produces a series of symptoms which appear in a typical fashion in the most different individuals and which in general have the character of a ceremonial. It is a great pity that no one has as yet collected them and systematically analysed them. Being the earliest products of the neurosis they should best be able to shed light on the mechanisms employed in its symptom-formation. They already exhibit the features which will emerge so disastrously if a serious illness follows. They tend to become attached to activities (which would later be carried out almost automatically) such as going to sleep, washing, dressing and walking about; and they tend also to repetition and waste of time. Why this should be so is at present not at all clear; but the sublimation of anal-erotic components plays an unmistakable part in it.

The advent of puberty opens a decisive chapter in the history of an obsessional neurosis. The genital organization which has been broken off in childhood starts again with great vigour. But, as we know, the sexual development in childhood determines what direction this new start at puberty will take. Not only will the early aggressive impulses be re-awakened; but a greater or lesser proportion of the new libidinal impulses - in bad cases the whole of them - will have to follow the course prescribed for them by regression and will emerge as aggressive and destructive tendencies. In consequence of the erotic trends being disguised in this way and owing to the powerful reaction-formations in the ego, the struggle against sexuality will henceforward be carried on under the banner of ethical principles. The ego will recoil with astonishment from promptings to cruelty and violence which enter consciousness from the id, and it has no notion that in them it is combating erotic wishes, including some to which it would not otherwise have taken exception. The overstrict super-ego insists all the more strongly on the suppression of sexuality, since this has assumed such repellent forms. Thus in obsessional neurosis the conflict is aggravated in two directions: the defensive forces become more intolerant and the forces that are to be fended off become more intolerable. Both effects are due to a single factor, namely, regression of the libido.

A good deal of what has been said may be objected to on the ground that the unpleasant obsessive ideas are themselves quite conscious. But there is no doubt that before becoming conscious they have been through the process of repression. In most of them the actual wording of the aggressive instinctual impulse is altogether unknown to the ego, and it requires a good deal of analytic work to make it conscious. What does penetrate into consciousness is usually only a distorted substitute which is either of a vague, dream-like and indeterminate nature or so travestied as to be unrecognizable. Even where repression has not encroached upon the content of the aggressive impulse it has certainly got rid of its accompanying affective character. As a result, the aggressiveness appears to the ego not to be an impulsion but, as the patients themselves say, merely a 'thought' which awakens no feeling. But the remarkable thing is that this is not the case. What happens is that the affect left out when the obsessional idea is perceived appears in a different place. The super-ego behaves as though repression had not occurred and as though it knew the real wording and full affective character of the aggressive impulse, and it treats the ego accordingly. The ego which, on the one hand, knows that it is innocent is obliged, on the other hand, to be aware of a sense of guilt and to carry a responsibility which it cannot account for. This state of affairs is, however, not so puzzling as it would seem at first sight. The behaviour of the super-ego is perfectly intelligible, and the contradiction in the ego merely shows that it has shut out the id by means of repression while remaining fully accessible to the influence of the super-ego. ¹ If it is asked why the ego does not also attempt to withdraw from the tormenting criticism of the super-ego, the answer is that it *does* manage to do so in a great number of instances. There are obsessional neuroses in which no sense of guilt whatever is present. In them, as far as can be seen, the ego has avoided becoming aware of it by instituting a fresh set of symptoms, penances or restrictions of a self-punishing kind. These symptoms, however, represent at the same time a satisfaction of masochistic impulses which, in their turn, have been reinforced by regression.

¹ Cf. Theodor Reik, 1925, 51.

Obsessional neurosis presents such a vast multiplicity of phenomena that no efforts have yet succeeded in making a coherent synthesis of all its variations. All we can do is to pick out certain typical correlations; but there is always the risk that we may have overlooked other uniformities of a no less important kind.

I have already described the general tendency of symptom-formation in obsessional neurosis. It is to give ever greater room to substitutive satisfaction at the expense of frustration. Symptoms which once stood for a restriction of the ego come later on to represent satisfactions as well, thanks to the ego's inclination to synthesis, and it is quite clear that this second meaning gradually becomes the more important of the two. The result of this process, which approximates more and more to a complete failure of the original purpose of defence, is an extremely restricted ego which is reduced to seeking satisfaction in the symptoms. The displacement of the distribution of forces in favour of satisfaction may have the dreaded final outcome of paralysing the will of the ego, which in every decision it has to make is almost as strongly impelled from the one side as from the other. The over-acute conflict between id and super-ego which has dominated the illness from the very beginning may assume such extensive proportions that the ego, unable to carry out its office of mediator, can undertake nothing which is not drawn into the sphere of that conflict.

VI

In the course of these struggles we come across two activities of the ego which form symptoms and which deserve special attention because they are obviously surrogates of repression and therefore well calculated to illustrate its purpose and technique. The fact that such auxiliary and substitutive techniques emerge may argue that true repression has met with difficulties in its functioning. If one considers how much more the ego is the scene of action of symptom-formation in obsessional neurosis than it is in hysteria and with what tenacity the ego clings to its relations to reality and to consciousness, employing all its intellectual faculties to that end - and indeed how the very process of thinking becomes hypercathected and erotized - then one may perhaps come to a better understanding of these variations of repression.

The two techniques I refer to are *undoing what has been done* and *isolating*. The first of these has a wide range of application and goes back very far. It is, as it were, negative magic, and endeavours, by means of motor symbolism, to 'blow away' not merely the *consequences* of some event (or experience or impression) but the event itself. I choose the term 'blow away' advisedly, so as to remind the reader of the part played by this technique not only in neuroses but in magical acts, popular customs and religious ceremonies as well. In obsessional neurosis the technique of undoing what has been done is first met with in the 'diphasic' symptoms, in which one action is cancelled out by a second, so that it is as though neither action had taken place, whereas, in reality, both have. This aim of undoing is the second underlying motive of obsessional ceremonials, the first being to take precautions in order to prevent the occurrence or recurrence of some particular event. The difference between the two is easily seen: the precautionary measures are rational, while trying to get rid of something by 'making it not to have happened' is irrational and in the nature of magic. It is of course to be suspected that the latter is the earlier motive of the two and proceeds from the animistic attitude towards the environment. This endeavour to undo shades off into normal behaviour in the case in which a person decides to regard an event as not having happened. But whereas he will take no direct steps against the event, and will simply pay no further attention to it or its consequences, the neurotic person will try to make the past itself non-existent. He will try to repress it by motor means. The same purpose may perhaps account for the obsession for *repeating* which is so frequently met with in this neurosis and the carrying out of which serves a number of contradictory intentions at once. When anything has not happened in the desired way it is undone by being repeated in a different way; and thereupon all the motives that exist for lingering over such repetitions come into play as well. As the neurosis proceeds, we often find that the endeavour to undo a traumatic experience is a motive of first-rate importance in the formation of symptoms. We thus unexpectedly discover a new, motor technique of defence, or (as we may say in this case with less inaccuracy) of repression.

The second of these techniques which we are setting out to describe for the first time, that of isolation, is peculiar to obsessional neurosis. It, too, takes place in the motor sphere. When something unpleasant has happened to the subject or when he himself has done something which has a significance for his neurosis, he interpolates an interval during which nothing further must happen - during which he must perceive nothing and do nothing. This behaviour, which seems strange at first sight, is soon seen to have a relation to repression. We know that in hysteria it is possible to cause a traumatic experience to be overtaken by amnesia. In obsessional neurosis this can often not be achieved: the experience is not forgotten, but, instead, it is deprived of its affect, and its associative connections are suppressed or interrupted so that it remains as though isolated and is not reproduced in the ordinary processes of thought. The effect of this isolation is the same as the effect of repression with amnesia. This technique, then, is reproduced in the isolations of obsessional neurosis; and it is at the same time given motor reinforcement for magical purposes. The elements that are held apart in this way are precisely those which belong together associatively. The motor isolation is meant to ensure an interruption of the connection in thought. The normal phenomenon of concentration provides a pretext for this kind of neurotic procedure: what seems to us important in the way of an impression or a piece of work must not be interfered with by the simultaneous claims of any other mental processes or activities. But even a normal person uses concentration to keep away not only what is irrelevant or unimportant, but, above all, what is unsuitable because it is contradictory. He is most disturbed by those elements which once belonged together but which have been torn apart in the course of his development - as, for instance, by manifestations of the ambivalence of his father-complex in his relation to God, or by impulses attached to his excretory organs in his emotions of love. Thus, in the normal course of things, the ego has a great deal of isolating work to do in its function of directing the current of thought. And, as we know, we are obliged, in carrying out our analytic technique, to train it to relinquish that function for the time being, eminently justified as it usually is.

We have all found by experience that it is especially difficult for an obsessional neurotic to carry out the fundamental rule of psycho-analysis. His ego is more watchful and makes sharper isolations, probably because of the high degree of tension due to conflict that exists between his super-ego and his id. While he is engaged in thinking, his ego has to keep off too much - the intrusion of unconscious phantasies and the manifestation of ambivalent trends. It must not relax, but is constantly prepared for a struggle. It fortifies this compulsion to concentrate and to isolate by the help of the magical acts of isolation which, in the form of symptoms, grow to be so noticeable and to have so much practical importance for the patient, but which are, of course, useless in themselves and are in the nature of ceremonials.

But in thus endeavouring to prevent associations and connections of thought, the ego is obeying one of the oldest and most fundamental commands of obsessional neurosis, the taboo on touching. If we ask ourselves why the avoidance of touching, contact or contagion should play such a large part in this neurosis and should become the subject-matter of complicated systems, the answer is that touching and physical contact are the immediate aim of the aggressive as well as the loving object- cathexes. Eros desires contact because it strives to make the ego and the loved object one, to abolish all spatial barriers between them. But destructiveness, too, which (before the invention of long-range weapons) could only take effect at close quarters, must presuppose physical contact, a coming to grips. To 'touch' a woman has become a euphemism for using her as a sexual object. Not to 'touch' one's genitals is the phrase employed for forbidding auto-erotic satisfaction. Since obsessional neurosis begins by persecuting erotic touching and then, after regression has taken place, goes on to persecute touching in the guise of aggressiveness, it follows that nothing is so strongly proscribed in that illness as touching nor so well suited to become the central point of a system of prohibitions. But isolating is removing the possibility of contact; it is a method of withdrawing a thing from being touched in any way. And when a neurotic isolates an impression or an activity by interpolating an interval, he is letting it be understood symbolically that he will not allow his thoughts about that impression or activity to come into associative contact with other thoughts.

This is as far as our investigations into the formation of symptoms take us. It is hardly worth while summing them up, for the results they have yielded are scanty and incomplete and tell us scarcely anything that we do not already know. It would be fruitless to turn our attention to symptom-formation in other disorders besides phobias, conversion hysteria and obsessional neurosis, for too little is known about them. But in reviewing those three neuroses together we are brought up against a very serious problem the consideration of which can no longer be put off. All three have as their outcome the destruction of the Oedipus complex; and in all three the motive force of the ego's opposition is, we believe, the fear of castration. Yet it is only in the phobias that this fear comes to the surface and is acknowledged. What has become of it in the other two neuroses? How has the ego spared itself this fear? The problem becomes accentuated when we recall the possibility, already referred to, that anxiety arises directly, by a kind of fermentation, from a libidinal cathexis whose processes have been disturbed. Furthermore, is it absolutely certain that fear of castration is the only motive force of repression (or defence)? If we think of neuroses in women we are bound to doubt it. For though we can with certainty establish in them the presence of a castration *complex*, we can hardly speak with propriety of castration *anxiety* where castration has already taken place.

VII

Let us go back again to infantile phobias of animals; for, when all is said and done, we understand them better than any other cases. In animal phobias, then, the ego has to oppose a libidinal object-cathexis coming from the id - a cathexis that belongs either to the positive or the negative Oedipus complex - because it believes that to give way to it would entail the danger of castration. This question has already been discussed, but there still remains a doubtful point to clear up. In 'Little Hans's' case - that is, in the case of a positive Oedipus complex - was it his fondness for his mother or was it his aggressiveness towards his father which called out the defence by the ego? In practice it seems to make no difference, especially as each set of feelings implies the other; but the question has a theoretical interest, since it is only the feeling of affection for the mother which can count as a purely erotic one. The aggressive impulse flows mainly from the destructive instinct; and we have always believed that in a neurosis it is against the demands of the libido and not against those of any other instinct that the ego is defending itself. In point of fact we know that after 'Hans's' phobia had been formed, his tender attachment to his mother seemed to disappear, having been completely disposed of by repression, while the formation of the symptom (the substitutive formation) took place in relation to his aggressive impulses. In the 'Wolf Man' the situation was simpler. The impulse that was repressed - his feminine attitude towards his father - was a genuinely erotic one; and it was in relation to that impulse that the formation of his symptoms took place.

It is almost humiliating that, after working so long, we should still be having difficulty in understanding the most fundamental facts. But we have made up our minds to simplify nothing and to hide nothing. If we cannot see things clearly we will at least see clearly what the obscurities are. What is hampering us here is evidently some hitch in the development of our theory of the instincts. We began by tracing the organization of the libido through its successive stages - from the oral through the sadistic-anal to the genital - and in doing so placed all the components of the sexual instinct on the same footing. Later it appeared that sadism was the representative of another instinct, which was opposed to Eros. This new view, that the instincts fall into two groups, seems to explode the earlier construction of the successive stages of libidinal organization. But we do not have to break fresh ground in order to find a way out of the difficulty. The solution has been at hand for a long time and lies in the fact that what we are concerned with are scarcely ever pure instinctual impulses but mixtures in various proportions of the two groups of instincts. If this is so, there is no need to revise our view of the organizations of the libido. A sadistic cathexis of an object may also legitimately claim to be treated as a libidinal one; and an aggressive impulse against the father can just as well be subjected to repression as a tender impulse towards the mother. Nevertheless we shall bear in mind for future consideration the possibility that repression is a process which has a special relation to the *genital* organization of the libido and that the ego resorts to other methods of defence when it has to secure itself against the libido on other levels of organization. To continue: a case like 'Little Hans's' does not enable us to come to any clear conclusion. It is true that in him an aggressive impulse was disposed of by repression, but this happened after the genital organization had been reached.

This time we will not lose sight of the part played by anxiety. We have said that as soon as the ego recognizes the danger of castration it gives the signal of anxiety and inhibits through the pleasure-unpleasure agency (in a way which we cannot as yet understand) the impending cathectic process in the id. At the same time the phobia is formed. And now the castration anxiety is directed to a different object and expressed in a distorted form, so that the patient is afraid, not of being castrated by his father, but of being bitten by a horse or devoured by a wolf. This substitutive formation has two obvious advantages. In the first place it avoids a conflict due to ambivalence (for the father was a loved object, too), and in the second place it enables the ego to cease generating anxiety. For the anxiety belonging to a phobia is conditional; it only emerges when the object of it is perceived - and rightly so, since it is only then that the danger-situation is present. There is no need to be afraid of being castrated by a father who is not there. On the other hand one cannot get rid of a father; he can appear whenever he chooses. But if he is replaced by an animal, all one has to do is to avoid the sight of it - that is, its presence - in order to be free from danger and anxiety. 'Little Hans', therefore, imposed a restriction upon his ego. He produced the inhibition of not leaving the house, so as not to come across any horses. The young Russian had an even easier time of it, for it was hardly a privation for him not to look at a particular picture-book any more. If his naughty sister had not kept on showing him the book with the picture of the wolf standing upright in it, he would have been able to feel safe from his fear.

On a previous occasion I have stated that phobias have the character of a projection in that they replace an internal, instinctual danger by an external, perceptual one. The advantage of this is that the subject can protect himself against an external danger by fleeing from it and avoiding the perception of it, whereas it is useless to flee from dangers that arise from within. This statement of mine was not incorrect, but it did not go below the surface of things. For an instinctual demand is, after all, not dangerous in itself; it only becomes so inasmuch as it entails a real external danger, the danger of castration. Thus what happens in a phobia in the last resort is merely that one external danger is replaced by another. The view that in a phobia the ego is able to escape anxiety by means of avoidance or of inhibitory symptoms fits in very well with the theory that that anxiety is only an affective signal and that no alteration has taken place in the economic situation.

The anxiety felt in animal phobias is, therefore, an affective reaction on the part of the ego to danger; and the danger which is being signalled in this way is the danger of castration. This anxiety differs in no respect from the realistic anxiety which the ego normally feels in situations of danger, except that its content remains unconscious and only becomes conscious in the form of a distortion.

The same will prove true, I think, of the phobias of adults, although the material which their neuroses work over is much more abundant and there are some additional factors in the formation of the symptoms. Fundamentally the position is identical. The agoraphobic patient imposes a restriction on his ego so as to escape a certain instinctual danger - namely, the danger of giving way to his erotic desires. For if he did so the danger of being castrated, or some similar danger, would once more be conjured up as it was in his childhood. I may cite as an instance the case of a young man who became agoraphobic because he was afraid of yielding to the solicitations of prostitutes and of contracting a syphilitic infection from them as a punishment.

I am well aware that a number of cases exhibit a more complicated structure and that many other repressed instinctual impulses can enter into a phobia. But they are only tributary streams which have for the most part joined the main current of the neurosis at a later stage. The symptomatology of agoraphobia is complicated by the fact that the ego does not confine itself to making a renunciation. In order to rob the situation of danger it does more: it usually effects a temporal regression to infancy (in extreme cases, to a time when the subject was in his mother's womb and protected against the dangers which threaten him in the present). Such a regression now becomes a condition whose fulfilment exempts the ego from making its renunciation. For instance, an agoraphobic patient may be able to walk in the street provided he is accompanied, like a small child, by someone he knows and trusts; or, for the same reason, he may be able to go out alone provided he remains within a certain distance of his own house and does not go to places which are not familiar to him or where people do not know him. What these stipulations are will depend in each case on the infantile factors which dominate him through his neurosis. The phobia of being alone is unambiguous in its meaning, irrespective of any infantile regression: it is, ultimately, an endeavour to avoid the temptation to indulge in solitary masturbation. Infantile regression can, of course, only take place when the subject is no longer a child.

A phobia generally sets in after a first anxiety attack has been experienced in specific circumstances, such as in the street or in a train or in solitude. Thereafter the anxiety is held in ban by the phobia, but it re-emerges whenever the protective condition cannot be fulfilled. The mechanism of phobia does good service as a means of defence and tends to be very stable. A continuation of the defensive struggle, in the shape of a struggle against the symptom, occurs frequently but not invariably.

What we have learnt about anxiety in phobias is applicable to obsessional neuroses as well. In this respect it is not difficult for us to put obsessional neuroses on all fours with phobias. In the former, the mainspring of all later symptom-formation is clearly the ego's fear of its super-ego. The danger-situation from which the ego must get away is the hostility of the super-ego. There is no trace of projection here; the danger is completely internalized. But if we ask ourselves what it is that the ego fears from the super-ego, we cannot but think that the punishment threatened by the latter must be an extension of the punishment of castration. Just as the father has become depersonalized in the shape of the super-ego, so has the fear of castration at his hands become transformed into an undefined social or moral anxiety. But this anxiety is concealed. The ego escapes it by obediently carrying out the commands, precautions and penances that have been enjoined on it. If it is impeded in doing so, it is at once overtaken by an extremely distressing feeling of discomfort which may be regarded as an equivalent of anxiety and which the patients themselves liken to anxiety.

The conclusion we have come to, then, is this. Anxiety is a reaction to a situation of danger. It is obviated by the ego's doing something to avoid that situation or to withdraw from it. It might be said that symptoms are created so as to avoid the generating of anxiety. But this does not go deep enough. It would be truer to say that symptoms are created so as to avoid a *danger-situation* whose presence has been signalled by the generation of anxiety. In the cases that we have discussed, the danger concerned was the danger of castration or of something traceable back to castration.

If anxiety is a reaction of the ego to danger, we shall be tempted to regard the traumatic neuroses, which so often follow upon a narrow escape from death, as a direct result of a fear of death (or fear *for* life) and to dismiss from our minds the question of castration and the dependent relationships of the ego. Most of those who observed the traumatic neuroses that occurred during the last war took this line, and triumphantly announced that proof was now forthcoming that a threat to the instinct of self-preservation could by itself produce a neurosis without any admixture of sexual factors and without requiring any of the complicated hypotheses of psycho-analysis. It is in fact greatly to be regretted that not a single analysis of a traumatic neurosis of any value is extant. And it is to be regretted, not because such an analysis would contradict the aetiological importance of sexuality - for any such contradiction has long since been disposed of by the introduction of the concept of narcissism, which brings the libidinal cathexis of the ego into line with the cathexes of objects and emphasizes the libidinal character of the instinct of self-preservation - but because, in the absence of any analyses of this kind, we have lost a most precious opportunity of drawing decisive conclusions about the relations between anxiety and the formation of symptoms. In view of all that we know about the structure of the comparatively simple neuroses of everyday life, it would seem highly improbable that a neurosis could come into being merely because of the objective presence of danger, without any participation of the deeper levels of the mental apparatus. But the unconscious seems to contain nothing that could give any content to our concept of the annihilation of life. Castration can be pictured on the basis of the daily experience of the faeces being separated from the body or on the basis of losing the mother's breast at weaning. But nothing resembling death can ever have been experienced; or if it has, as in fainting, it has left no observable traces behind. I am therefore inclined to adhere to the view that the fear of death should be regarded as analogous to the fear of castration and that the situation to which the ego is reacting is one of being abandoned by the protecting super-ego - the powers of destiny - so that it has no longer any safeguard against all the dangers that surround it. In addition, it must be remembered that in the experiences which lead to a traumatic neurosis the protective shield against external stimuli is broken through and excessive amounts of excitation impinge upon the mental apparatus; so that we have here a second possibility - that anxiety is not only being signalled as an affect but is also being freshly created out of the economic conditions of the situation.

The statement I have just made, to the effect that the ego has been prepared to expect castration by having undergone constantly repeated object-losses, places the question of anxiety in a new light. We have hitherto regarded it as an affective signal of danger; but now, since the danger is so often one of castration, it appears to us as a reaction to a loss, a separation. Even though a number of considerations immediately arise which make against this view, we cannot but be struck by one very remarkable correlation. The first experience of anxiety which an individual goes through (in the case of human beings, at all events) is birth, and, objectively speaking, birth is a separation from the mother. It could be compared to a castration of the mother (by equating the child with a penis). Now it would be very satisfactory if anxiety, as a symbol of a separation, were to be repeated on every subsequent occasion on which a separation took place. But unfortunately we are prevented from making use of this correlation by the fact that birth is not experienced subjectively as a separation from the mother, since the foetus, being a completely narcissistic creature, is totally unaware of her existence as an object. Another adverse argument is that we know what the affective reactions to a separation are: they are pain and mourning, not anxiety. Incidentally, it may be remembered that in discussing the question of mourning we also failed to discover why it should be such a painful thing.

VIII

The time has come to pause and consider. What we clearly want is to find something that will tell us what anxiety really is, some criterion that will enable us to distinguish true statements about it from false ones. But this is not easy to get. Anxiety is not so simple a matter. Up till now we have arrived at nothing but contradictory views about it, none of which can, to the unprejudiced eye, be given preference over the others. I therefore propose to adopt a different procedure. I propose to assemble, quite impartially, all the facts that we know about anxiety without expecting to arrive at a fresh synthesis.

Anxiety, then, is in the first place something that is felt. We call it an affective state, although we are also ignorant of what an affect is. As a feeling, anxiety has a very marked character of unpleasure. But that is not the whole of its quality. Not every unpleasure can be called anxiety, for there are other feelings, such as tension, pain or mourning, which have the character of unpleasure. Thus anxiety must have other distinctive features besides this quality of unpleasure. Can we succeed in understanding the differences between these various unpleasurable affects?

We can at any rate note one or two things about the feeling of anxiety. Its unpleasurable character seems to have a note of its own - something not very obvious, whose presence is difficult to prove yet which is in all likelihood there. But besides having this special feature which is difficult to isolate, we notice that anxiety is accompanied by fairly definite physical sensations which can be referred to particular organs of the body. As we are not concerned here with the physiology of anxiety, we shall content ourselves with mentioning a few representatives of these sensations. The clearest and most frequent ones are those connected with the respiratory organs and with the heart. They provide evidence that motor innervations - that is, processes of discharge - play a part in the general phenomenon of anxiety.

Analysis of anxiety-states therefore reveals the existence of (1) a specific character of unpleasure, (2) acts of discharge and (3) perceptions of those acts. The two last points indicate at once a difference between states of anxiety and other similar states, like those of mourning and pain. The latter do not have any motor manifestation; or if they have, the manifestation is not an integral part of the whole state but is distinct from it as being a result of it or a reaction to it. Anxiety, then, is a special state of unpleasure with acts of discharge along particular paths. In accordance with our general views we should be inclined to think that anxiety is based upon an increase of excitation which on the one hand produces the character of unpleasure and on the other finds relief through the acts of discharge already mentioned. But a purely physiological account of this sort will scarcely satisfy us. We are tempted to assume the presence of a historical factor which binds the sensations of anxiety and its innervations firmly together. We assume, in other words, that an anxiety-state is the reproduction of some experience which contained the necessary conditions for such an increase of excitation and a discharge along particular paths, and that from this circumstance the unpleasure of anxiety receives its specific character. In man, birth provides a prototypic experience of this kind, and we are therefore inclined to regard anxiety-states as a reproduction of the trauma of birth.

This does not imply that anxiety occupies an exceptional position among the affective states. In my opinion the other affects are also reproductions of very early, perhaps even pre-individual, experiences of vital importance; and I should be inclined to regard them as universal, typical and innate hysterical attacks, as compared to the recently and individually acquired attacks which occur in hysterical neuroses and whose origin and significance as mnemonic symbols have been revealed by analysis. It would be very desirable, of course, to be able to demonstrate the truth of this view in a number of such affects - a thing which is still very far from being the case.

The view that anxiety goes back to the event of birth raises immediate objections which have to be met. It may be argued that anxiety is a reaction which, in all probability, is common to every organism, certainly every organism of a higher order, whereas birth is only experienced by the mammals; and it is doubtful whether in all of them, even, birth has the significance of a trauma. Therefore there can be anxiety without the prototype of birth. But this objection takes us beyond the barrier that divides psychology from biology. It may be that, precisely because anxiety has an indispensable biological function to fulfil as a reaction to a state of danger, it is differently contrived in different organisms. We do not know, besides, whether anxiety involves the same sensations and innervations in organisms far removed from man as it does in man himself. Thus there is no good argument here against the view that, in man, anxiety is modelled upon the process of birth.

If the structure and origin of anxiety are as described, the next question is: what is the function of anxiety and on what occasions is it reproduced? The answer seems to be obvious and convincing: anxiety arose originally as a reaction to a state of *danger* and it is reproduced whenever a state of that kind recurs.

This answer, however, raises further considerations. The innervations involved in the original state of anxiety probably had a meaning and purpose, in just the same way as the muscular movements which accompany a first hysterical attack. In order to understand a hysterical attack, all one has to do is to look for the situation in which the movements in question formed part of an appropriate and expedient action. Thus at birth it is probable that the innervation, in being directed to the respiratory organs, is preparing the way for the activity of the lungs, and, in accelerating the heartbeat, is helping to keep the blood free from toxic substances. Naturally, when the anxiety-state is reproduced later as an affect it will be lacking in any such expediency, just as are the repetitions of a hysterical attack. When the individual is placed in a new situation of danger it may well be quite inexpedient for him to respond with an anxiety-state (which is a reaction to an earlier danger) instead of initiating a reaction appropriate to the current danger. But his behaviour may become expedient once more if the danger-situation is recognized as it approaches and is signalled by an outbreak of anxiety. In that case he can at once get rid of his anxiety by having recourse to more suitable measures. Thus we see that there are two ways in which anxiety can emerge: in an inexpedient way, when a new situation of danger has occurred, or in an expedient way in order to give a signal and prevent such a situation from occurring.

But what is a 'danger'? In the act of birth there is a real danger to life. We know what this means objectively; but in a psychological sense it says nothing at all to us. The danger of birth has as yet no psychical content. We cannot possibly suppose that the foetus has any sort of knowledge that there is a possibility of its life being destroyed. It can only be aware of some vast disturbance in the economy of its narcissistic libido. Large sums of excitation crowd in upon it, giving rise to new kinds of feelings of unpleasure, and some organs acquire an increased cathexis, thus foreshadowing the object-cathexis which will soon set in. What elements in all this will be made use of as the sign of a 'danger-situation'?

Unfortunately far too little is known about the mental make-up of a new-born baby to make a direct answer possible. I cannot even vouch for the validity of the description I have just given. It is easy to say that the baby will repeat its affect of anxiety in every situation which recalls the event of birth. The important thing to know is what recalls the event and what it is that is recalled.

All we can do is to examine the occasions on which infants in arms or somewhat older children show readiness to produce anxiety. In his book on the trauma of birth, Rank (1924) has made a determined attempt to establish a relationship between the earliest phobias of children and the impressions made on them by the event of birth. But I do not think he has been successful. His theory is open to two objections. In the first place, he assumes that the infant has received certain sensory impressions, in particular of a visual kind, at the time of birth, the renewal of which can recall to its memory the trauma of birth and thus evoke a reaction of anxiety. This assumption is quite unfounded and extremely improbable. It is not credible that a child should retain any but tactile and general sensations relating to the process of birth. If, later on, children show fear of small animals that disappear into holes or emerge from them, this reaction, according to Rank, is due to their perceiving an analogy. But it is an analogy of which they cannot be aware. In the second place, in considering these later anxiety-situations Rank dwells, as suits him best, now on the child's recollection of its happy intra-uterine existence, now on its recollection of the traumatic disturbance which interrupted that existence which leaves the door wide open for arbitrary interpretation. There are, moreover, certain examples of childhood anxiety which directly traverse his theory. When, for instance, a child is left alone in the dark one would expect it, according to his view, to welcome the re-establishment of the intra-uterine situation; yet it is precisely on such occasions that the child reacts with anxiety. And if this is explained by saying that the child is being reminded of the interruption which the event of birth made in its intra-uterine happiness, it becomes impossible to shut one's eyes any longer to the far-fetched character of such explanations.

I am driven to the conclusion that the earliest phobias of infancy cannot be directly traced back to impressions of the act of birth and that so far they have not been explained. A certain preparedness for anxiety is undoubtedly present in the infant in arms. But this preparedness for anxiety, instead of being at its maximum immediately after birth and then slowly decreasing, does not emerge till later, as mental development proceeds, and lasts over a certain period of childhood. If these early phobias persist beyond that period one is inclined to suspect the presence of a neurotic disturbance, although it is not at all clear what their relation is to the undoubted neuroses that appear later on in childhood.

Only a few of the manifestations of anxiety in children are comprehensible to us, and we must confine our attention to them. They occur, for instance, when a child is alone, or in the dark, or when it finds itself with an unknown person instead of one to whom it is used - such as its mother. These three instances can be reduced to a single condition - namely, that of missing someone who is loved and longed for. But here, I think, we have the key to an understanding of anxiety and to a reconciliation of the contradictions that seem to beset it.

The child's mnemonic image of the person longed for is no doubt intensely cathected, probably in a hallucinatory way at first. But this has no effect; and now it seems as though the longing turns into anxiety. This anxiety has all the appearance of being an expression of the child's feeling at its wits' end, as though in its still very undeveloped state it did not know how better to cope with its cathexis of longing. Here anxiety appears as a reaction to the felt loss of the object; and we are at once reminded of the fact that castration anxiety, too, is a fear of being separated from a highly valued object, and that the earliest anxiety of all - the 'primal anxiety' of birth - is brought about on the occasion of a separation from the mother.

But a moment's reflection takes us beyond this question of loss of object. The reason why the infant in arms wants to perceive the presence of its mother is only because it already knows by experience that she satisfies all its needs without delay. The situation, then, which it regards as a 'danger' and against which it wants to be safeguarded is that of non-satisfaction, of a *growing tension due to need*, against which it is helpless. I think that if we adopt this view all the facts fall into place. The situation of non-satisfaction in which the amounts of stimulation rise to an unpleasurable height without its being possible for them to be mastered psychically or discharged must for the infant be analogous to the experience of being born - must be a repetition of the situation of danger. What both situations have in common is the economic disturbance caused by an accumulation of amounts of stimulation which require to be disposed of. It is this factor, then, which is the real essence of the 'danger'. In both cases the reaction of anxiety sets in. (This reaction is still an expedient one in the infant in arms, for the discharge, being directed into the respiratory and vocal muscular apparatus, now calls its mother to it, just as it activated the lungs of the new-born baby to get rid of the internal stimuli.) It is unnecessary to suppose that the child carries anything more with it from the time of its birth than this way of indicating the presence of danger.

When the infant has found out by experience that an external, perceptible object can put an end to the dangerous situation which is reminiscent of birth, the content of the danger it fears is displaced from the economic situation on to the condition which determined that situation, viz., the loss of object. It is the absence of the mother that is now the danger; and as soon as that danger arises the infant gives the signal of anxiety, before the dreaded economic situation has set in. This change constitutes a first great step forward in the provision made by the infant for its self-preservation, and at the same time represents a transition from the automatic and involuntary fresh appearance of anxiety to the intentional reproduction of anxiety as a signal of danger.

In these two aspects, as an automatic phenomenon and as a rescuing signal, anxiety is seen to be a product of the infant's mental helplessness which is a natural counterpart of its biological helplessness. The striking coincidence by which the anxiety of the new-born baby and the anxiety of the infant in arms are both conditioned by separation from the mother does not need to be explained on psychological lines. It can be accounted for simply enough biologically; for, just as the mother originally satisfied all the needs of the foetus through the apparatus of her own body, so now, after its birth, she continues to do so, though partly by other means. There is much more continuity between intra-uterine life and earliest infancy than the impressive caesura of the act of birth would have us believe. What happens is that the child's biological situation as a foetus is replaced for it by a psychical object-relation to its mother. But we must not forget that during its intra-uterine life the mother was not an object for the foetus, and that at that time there were no objects at all. It is obvious that in this scheme of things there is no place for the abreaction of the birth trauma. We cannot find that anxiety has any function other than that of being a signal for the avoidance of a danger situation.

The significance of the loss of object as a determinant of anxiety extends considerably further. For the next transformation of anxiety, viz. the castration anxiety belonging to the phallic phase, is also a fear of separation and is thus attached to the same determinant. In this case the danger is of being separated from one's genitals. Ferenczi has traced, quite correctly, I think, a clear line of connection between this fear and the fears contained in the earlier situations of danger. The high degree of narcissistic value which the penis possesses can appeal to the fact that that organ is a guarantee to its owner that he can be once more united to his mother - i.e. to a substitute for her - in the act of copulation. Being deprived of it amounts to a renewed separation from her, and this in its turn means being helplessly exposed to an unpleasurable tension due to instinctual need, as was the case at birth. But the need whose increase is feared is now a specific one belonging to the genital libido and is no longer an indeterminate one, as it was in the period of infancy. It may be added that for a man who is impotent (that is, who is inhibited by the threat of castration) the substitute for copulation is a phantasy of returning into his mother's womb. Following Ferenczi's line of thought, we might say that the man in question, having tried to bring about his return into his mother's womb by using his genital organ to represent him, is now replacing that organ regressively by his whole person.

The progress which the child makes in its development - its growing independence, the sharper division of its mental apparatus into several agencies, the advent of new needs - cannot fail to exert an influence upon the content of the danger situation. We have already traced the change of that content from loss of the mother as an object to castration. The next change is caused by the power of the super-ego. With the depersonalization of the parental agency from which castration was feared, the danger becomes less defined. Castration anxiety develops into moral anxiety - social anxiety - and it is not so easy now to know what the anxiety is about. The formula, 'separation and expulsion from the horde', only applies to that later portion of the super-ego which has been formed on the basis of social prototypes, not to the nucleus of the super-ego, which corresponds to the introjected parental agency. Putting it more generally, what the ego regards as the danger and responds to with an anxiety-signal is that the super-ego should be angry with it or punish it or cease to love it. The final transformation which the fear of the super-ego undergoes is, it seems to me, the fear of death (or fear for life) which is a fear of the super-ego projected on to the powers of destiny.

At one time I attached some importance to the view that what was used as a discharge of anxiety was the cathexis which had been withdrawn in the process of repression. To-day this seems to me of scarcely any interest. The reason for this is that whereas I formerly believed that anxiety invariably arose automatically by an economic process, my present conception of anxiety as a signal given by the ego in order to affect the pleasure-unpleasure agency does away with the necessity of considering the economic factor. Of course there is nothing to be said against the idea that it is precisely the energy that has been liberated by being withdrawn through repression which is used by the ego to arouse the affect; but it is no longer of any importance which portion of energy is employed for this purpose.

This new view of things calls for an examination of another assertion of mine - namely, that the ego is the actual seat of anxiety. I think this proposition still holds good. There is no reason to assign any manifestation of anxiety to the super-ego; while the expression 'anxiety of the id' would stand in need of correction, though rather as to its form than its substance. Anxiety is an affective state and as such can, of course, only be felt by the ego. The id cannot have anxiety as the ego can; for it is not an organization and cannot make a judgement about situations of danger. On the other hand it very often happens that processes take place or begin to take place in the id which cause the ego to produce anxiety. Indeed, it is probable that the earliest repressions as well as most of the later ones are motivated by an ego-anxiety of this sort in regard to particular processes in the id. Here again we are rightly distinguishing between two cases: the case in which something occurs in the id which activates one of the danger-situations for the ego and induces the latter to give the anxiety-signal for inhibition to take place, and the case in which a situation analogous to the trauma of birth is established in the id and an automatic reaction of anxiety ensues. The two cases may be brought closer together if it is pointed out that the second case corresponds to the earliest and original danger-situation, while the first case corresponds to any one of the later determinants of anxiety that have been derived from it; or, as applied to the disorders which we in fact come across, that the second case is operative in the aetiology of the 'actual' neuroses, while the first remains typical for that of the psychoneuroses.

We see, then, that it is not so much a question of taking back our earlier findings as of bringing them into line with more recent discoveries. It is still an undeniable fact that in sexual abstinence, in improper interference with the course of sexual excitation or if the latter is diverted from being worked over psychically, anxiety arises directly out of libido; in other words, that the ego is reduced to a state of helplessness in the face of an excessive tension due to need, as it was in the situation of birth, and that anxiety is then generated. Here once more, though the matter is of little importance, it is very possible that what finds discharge in the generating of anxiety is precisely the surplus of unutilized libido. As we know, a psychoneurosis is especially liable to develop on the basis of an 'actual' neurosis. This looks as though the ego were attempting to save itself from anxiety, which it has learned to keep in suspension for a while, and to bind it by the formation of symptoms. Analysis of the traumatic war neuroses - a term which, incidentally, covers a great variety of disorders - would probably have shown that a number of them possess some characteristics of the 'actual' neuroses.

In describing the evolution of the various danger-situations from their prototype, the act of birth, I have had no intention of asserting that every later determinant of anxiety completely invalidates the preceding one. It is true that, as the development of the ego goes on, the earlier danger-situations tend to lose their force and to be set aside, so that we might say that each period of the individual's life has its appropriate determinant of anxiety. Thus the danger of psychical helplessness is appropriate to the period of life when his ego is immature; the danger of loss of object, to early childhood when he is still dependent on others; the danger of castration, to the phallic phase; and the fear of his super-ego, to the latency period. Nevertheless, all these danger-situations and determinants of anxiety can persist side by side and cause the ego to react to them with anxiety at a period later than the appropriate one; or, again, several of them can come into operation at the same time. It is possible, moreover, that there is a fairly close relationship between the danger-situation that is operative and the form taken by the ensuing neurosis.¹

¹ Since the differentiation of the ego and the id, our interest in the problems of repression, too, was bound to receive a fresh impetus. Up till then we had been content to confine our interest to those aspects of repression which concerned the ego - the keeping away from consciousness and from motility, and the formation of substitutes (symptoms). With regard to the repressed instinctual impulses themselves, we assumed that they remained unaltered in the unconscious for an indefinite length of time. But now our interest is turned to the vicissitudes of the repressed and we begin to suspect that it is not self-evident, perhaps not even usual, that those impulses should remain unaltered and unalterable in this way. There is no doubt that the original impulses have been inhibited and deflected from their aim through repression. But has the portion of them in the unconscious maintained itself and been proof against the influences of life that tend to alter and depreciate them? In other words, do the old wishes, about whose former existence analysis tells us, still exist? The answer seems ready to hand and certain. It is that the old, repressed wishes must still be present in the unconscious since we still find their derivatives, the symptoms, in operation. But this answer is not sufficient. It does not enable us to decide between two possibilities: either that the old wish is now operating only through its derivatives, having transferred the whole of its cathectic energy to them, or that it is itself still in existence too. If its fate has been to exhaust itself in cathecting its derivatives, there is yet a third possibility. In the course of the neurosis it may have become re-animated by regression, anachronistic though it may now be. These are no idle speculations. There are many things about mental life, both normal and pathological, which seem to call for the raising of such questions. In my paper, 'The Dissolution of the Oedipus Complex' (1924*d*), I had occasion to notice the difference between the mere repression and the real removal of an old wishful impulse.

When, in an earlier part of this discussion, we found that the danger of castration was of importance in more than one neurotic illness, we put ourselves on guard against overestimating that factor, since it could not be a decisive one for the female sex, who are undoubtedly more subject to neuroses than men. We now see that there is no danger of our regarding castration anxiety as the sole motive force of the defensive processes which lead to neurosis. I have shown elsewhere how little girls, in the course of their development, are led into making a tender object-cathexis by their castration complex. It is precisely in women that the danger situation of loss of object seems to have remained the most effective. All we need to do is to make a slight modification in our description of their determinant of anxiety, in the sense that it is no longer a matter of feeling the want of, or actually losing the object itself, but of losing the object's love. Since there is no doubt that hysteria has a strong affinity with femininity, just as obsessional neurosis has with masculinity, it appears probable that, as a determinant of anxiety, loss of love plays much the same part in hysteria as the threat of castration does in phobias and fear of the super-ego in obsessional neurosis.

IX

What is now left for us is to consider the relationship between the formation of symptoms and the generating of anxiety.

There seem to be two very widely held opinions on this subject. One is that anxiety is itself a symptom of neurosis. The other is that there is a much more intimate relation between the two. According to the second opinion, symptoms are only formed in order to avoid anxiety: they bind the psychical energy which would otherwise be discharged as anxiety. Thus anxiety would be the fundamental phenomenon and main problem of neurosis.

That this latter opinion is at least in part true is shown by some striking examples. If an agoraphobic patient who has been accompanied into the street is left alone there, he will produce an anxiety attack. Or if an obsessional neurotic is prevented from washing his hands after having touched something, he will become a prey to almost unbearable anxiety. It is plain, then, that the purpose and the result of the imposed condition of being accompanied in the street and the obsessional act of washing the hands were to obviate outbreaks of anxiety of this kind. In this sense every inhibition which the ego imposes on itself can be called a symptom.

Since we have traced back the generating of anxiety to a situation of danger, we shall prefer to say that symptoms are created in order to remove the ego from a situation of danger. If the symptoms are prevented from being formed, the danger does in fact materialize; that is, a situation analogous to birth is established in which the ego is helpless in the face of a constantly increasing instinctual demand - the earliest and original determinant of anxiety. Thus in our view the relation between anxiety and symptom is less close than was supposed, for we have inserted the factor of the danger-situation between them. We can also add that the generating of anxiety sets symptom formation going and is, indeed, a necessary prerequisite of it. For if the ego did not arouse the pleasure-unpleasure agency by generating anxiety, it would not obtain the power to arrest the process which is preparing in the id and which threatens danger. There is in all this an evident inclination to limit to a minimum the amount of anxiety generated and to employ it only as a signal; for to do otherwise would only result in feeling in another place the unpleasure which the instinctual process was threatening to produce, and that would not be a success from the standpoint of the pleasure principle, although it is one that occurs often enough in the neuroses.

Symptom-formation, then, does in fact put an end to the danger-situation. It has two aspects: one, hidden from view, brings about the alteration in the id in virtue of which the ego is removed from danger; the other, presented openly, shows what has been created in place of the instinctual process that has been affected - namely, the substitutive formation.

It would, however, be more correct to ascribe to the *defensive process* what we have just said about symptom-formation and to use the latter term as synonymous with substitute-formation. It will then be clear that the defensive process is analogous to the flight by means of which the ego removes itself from a danger that threatens it from outside. The defensive process is an attempt at flight from an instinctual danger. An examination of the weak points in this comparison will make things clearer.

One objection to it is that loss of an object (or loss of love on the part of the object) and the threat of castration are just as much dangers coming from outside as, let us say, a ferocious animal would be; they are not instinctual dangers. Nevertheless, the two cases are not the same. A wolf would probably attack us irrespectively of our behaviour towards it; but the loved person would not cease to love us nor should we be threatened with castration if we did not entertain certain feelings and intentions within us. Thus such instinctual impulses are determinants of external dangers and so become dangerous in themselves; and we can now proceed against the external danger by taking measures against the internal ones. In phobias of animals the danger seems to be still felt entirely as an external one, just as it has undergone an external displacement in the symptom. In obsessional neuroses the danger is much more internalized. That portion of anxiety in regard to the super-ego which constitutes *social* anxiety still represents an internal substitute for an external danger, while the other portion- *moral* anxiety - is already completely endopsychic.

Another objection is that in an attempt at flight from an impending external danger all that the subject is doing is to increase the distance between himself and what is threatening him. He is not preparing to defend himself against it or attempting to alter anything about it, as would be the case if he attacked the wolf with a stick or shot at it with a gun. But the defensive process seems to do something more than would correspond to an attempt at flight. It joins issue with the threatening instinctual process and somehow suppresses it or deflects it from its aims and thus renders it innocuous. This objection seems unimpeachable and must be given due weight. I think it is probable that there are some defensive processes which can truly be likened to an attempt at flight, while in others the ego takes a much more active line of self-protection and initiates vigorous counter-measures. But perhaps the whole analogy between defence and flight is invalidated by the fact that both the ego and the instinct in the id are parts of the same organization, not separate entities like the wolf and the child, so that any kind of behaviour on the part of the ego will result in an alteration in the instinctual process as well.

This study of the determinants of anxiety has, as it were, shown the defensive behaviour of the ego transfigured in a rational light. Each situation of danger corresponds to a particular period of life or a particular developmental phase of the mental apparatus and appears to be justifiable for it. In early infancy the individual is really not equipped to master psychically the large sums of excitation that reach him whether from without or from within. Again, at a certain period of life his most important interest really is that the people he is dependent on should not withdraw their loving care of him. Later on in his boyhood, when he feels that his father is a powerful rival in regard to his mother and becomes aware of his own aggressive inclinations towards her and of his sexual intentions towards his mother, he really is justified in being afraid of his father; and his fear of being punished by him can find expression through phylogenetic reinforcement in the fear of being castrated. Finally, as he enters into social relationships, it really is necessary for him to be afraid of his super-ego, to have a conscience; and the absence of that factor would give rise to severe conflicts, dangers and so on.

But this last point raises a fresh problem. Instead of the affect of anxiety let us take, for a moment, another affect - that of pain, for instance. It seems quite normal that at four years of age a girl should weep painfully if her doll is broken; or at six, if her governess reproves her; or at sixteen, if she is slighted by her young man; or at twenty-five, perhaps, if a child of her own dies. Each of these determinants of pain has its own time and each passes away when that time is over. Only the final and definitive determinants remain throughout life. We should think it strange if this same girl, after she had grown to be a wife and mother, were to cry over some worthless trinket that had been damaged. Yet that is how the neurotic behaves. Although all the agencies for mastering stimuli have long ago been developed within wide limits in his mental apparatus, and although he is sufficiently grown up to satisfy most of his needs for himself and has long ago learnt that castration is no longer practised as a punishment, he nevertheless behaves as though the old danger-situations still existed, and keeps hold of all the earlier determinants of anxiety.

Why this should be so calls for a rather long reply. First of all, we must sift the facts. In a great number of cases the old determinants of anxiety do really lapse, after having produced neurotic reactions. The phobias of very young children, fears of being alone or in the dark or with strangers - phobias which can almost be called normal - usually pass off later on; the child 'grows out of them', as we say about some other disturbances of childhood. Animal phobias, which are of such frequent occurrence, undergo the same fate and many conversion hysterias of early years find no continuation in later life. Ceremonial actions appear extremely often in the latency period, but only a very small percentage of them develop later into a full obsessional neurosis. In general, so far as we can tell from our observations of town children belonging to the white races and living according to fairly high cultural standards, the neuroses of childhood are in the nature of regular episodes in a child's development, although too little attention is still being paid to them. Signs of childhood neuroses can be detected in *all* adult neurotics without exception; but by no means all children who show those signs become neurotic in later life. It must be, therefore, that certain determinants of anxiety are relinquished and certain danger-situations lose their significance as the individual becomes more mature. Moreover, some of these danger-situations manage to survive into later times by modifying their determinants of anxiety so as to bring them up to date. Thus, for instance, a man may retain his fear of castration in the guise of a syphilidophobia, after he has come to know that it is no longer customary to castrate people for indulging their sexual lusts, but that, on the other hand, severe diseases may overtake anyone who thus gives way to his instincts. Other determinants of anxiety, such as fear of the super-ego, are destined not to disappear at all but to accompany people throughout their lives. In that case the neurotic will differ from the normal person in that his reactions to the dangers in question will be unduly strong. Finally, being grown-up affords no absolute protection against a return of the original traumatic anxiety-situation. Each individual has in all probability a limit beyond which his mental apparatus fails in its function of mastering the quantities of excitation which require to be disposed of.

These minor rectifications cannot in any way alter the fact which is here under discussion, that a great many people remain infantile in their behaviour in regard to danger and do not overcome determinants of anxiety which have grown out of date. To deny this would be to deny the existence of neurosis, for it is precisely such people whom we call neurotics. But how is this possible? Why are not all neuroses episodes in the development of the individual which come to a close when the next phase is reached? Whence comes the element of persistence in these reactions to danger? Why does the affect of anxiety alone seem to enjoy the advantage over all other affects of evoking reactions which are distinguished from the rest in being abnormal and which, through their inexpediency, run counter to the movement of life? In other words, we have once more come unawares upon the riddle which has so often confronted us: whence does neurosis come - what is its ultimate, its own peculiar *raison d'être*? After tens of years of psycho-analytic labours, we are as much in the dark about this problem as we were at the start.

X

Anxiety is the reaction to danger. One cannot, after all, help suspecting that the reason why the affect of anxiety occupies a unique position in the economy of the mind has something to do with the essential nature of danger. Yet dangers are the common lot of humanity; they are the same for everyone. What we need and cannot lay our finger on is some factor which will explain why some people are able to subject the affect of anxiety, in spite of its peculiar quality, to the normal workings of the mind, or which decides who is doomed to come to grief over that task. Two attempts to find a factor of this kind have been made; and it is natural that such efforts should meet with a sympathetic reception, since they promise help to meet a tormenting need. The two attempts in question are mutually complementary; they approach the problem at opposite ends. The first was made by Alfred Adler more than ten years ago. His contention, reduced to its essence, was that the people who came to grief over the task set them by danger were those who were too greatly impeded by some organic inferiority. If it were true that *simplex sigillum veri*, we should welcome such a solution as a deliverance. But on the contrary, our critical studies of the last ten years have effectively demonstrated the total inadequacy of such an explanation - an explanation, moreover, which sets aside the whole wealth of material that has been discovered by psycho-analysis.

The second attempt was made by Otto Rank in 1923 in his book, *The Trauma of Birth*. It would be unjust to put his attempt on the same level as Adler's except in this single point which concerns us here, for it remains on psycho-analytic ground and pursues a psycho-analytic line of thought, so that it may be accepted as a legitimate endeavour to solve the problems of analysis. In this matter of the relation of the individual to danger Rank moves away from the question of organic defect in the individual and concentrates on the variable degree of intensity of the danger. The process of birth is the first situation of danger, and the economic upheaval which it produces becomes the prototype of the reaction of anxiety. We have already traced the line of development which connects this first danger-situation and determinant of anxiety with all the later ones, and we have seen that they all retain a common quality in so far as they signify in a certain sense a separation from the mother - at first only in a biological sense, next as a direct loss of object and later as a loss of object incurred indirectly. The discovery of this extensive concatenation is an undoubted merit of Rank's construction. Now the trauma of birth overtakes each individual with a different degree of intensity, and the violence of his anxiety-reaction varies with the strength of the trauma; and it is the initial amount of anxiety generated in him which, according to Rank, decides whether he will ever learn to control it - whether he will become neurotic or normal.

It is not our business to criticize Rank's hypothesis in detail here. We have only to consider whether it helps to solve our particular problem. His formula - that those people become neurotic in whom the trauma of birth was so strong that they have never been able completely to abreact it - is highly disputable from a theoretical point of view. We do not rightly know what is meant by abreacting the trauma. Taken literally, it implies that the more frequently and the more intensely a neurotic person reproduces the affect of anxiety the more closely will he approach to mental health - an untenable conclusion. It was because it did not tally with the facts that I gave up the theory of abreaction which had played such a large part in the cathartic method. To lay so much stress, too, on the variability in the strength of the birth trauma is to leave no room for the legitimate claims of hereditary constitution as an aetiological factor. For this variability is an organic factor which operates in an accidental fashion in relation to the constitution and is itself dependent on many influences which might be called accidental - as, for instance, on timely assistance in child-birth. Rank's theory completely ignores constitutional factors as well as phylogenetic ones. If, however, we were to try to find a place for the constitutional factor by qualifying his statement with the proviso, let us say, that what is really important is the extent to which the individual reacts to the variable intensity of the trauma of birth, we should be depriving his theory of its significance and should be relegating the new factor introduced by him to a position of minor importance: the factor which decided whether a neurosis should supervene or not would lie in a different, and once more in an unknown, field.

Moreover, the fact that while man shares the process of birth with the other mammals he alone has the privilege over them of possessing a special disposition to neurosis is hardly favourable to Rank's theory. But the main objection to it is that it floats in the air instead of being based upon ascertained observations. No body of evidence has been collected to show that difficult and protracted birth does in fact coincide with the development of a neurosis, or even that children so born exhibit the phenomena of early infantile apprehensiveness more strongly and over a longer period than other children. It might be rejoined that induced labour and births that are easy for the mother may possibly involve a severe trauma for the child. But we can still point out that births which lead to asphyxia would be bound to give clear evidence of the results which are supposed to follow. It should be one of the advantages of Rank's aetiological theory that it postulates a factor whose existence can be verified by observation. And so long as no such attempt at verification has been made it is impossible to assess the theory's value.

On the other hand I cannot identify myself with the view that Rank's theory contradicts the aetiological importance of the sexual instincts as hitherto recognized by psycho-analysis. For his theory only has reference to the individual's relation to the danger-situation, so that it leaves it perfectly open to us to assume that if a person has not been able to master his first dangers he is bound to come to grief as well in later situations involving sexual danger and thus be driven into a neurosis.

I do not believe, therefore, that Rank's attempt has solved the problem of the causation of neurosis; nor do I believe that we can say as yet how much it may nevertheless have *contributed* to such a solution. If an investigation into the effects of difficult birth on the disposition to neurosis should yield negative results, we shall rate the value of his contribution low. It is to be feared that our need to find a single, tangible 'ultimate cause' of neurotic illness will remain unsatisfied. The ideal solution, which medical men no doubt still yearn for, would be to discover some bacillus which could be isolated and bred in a pure culture and which, when injected into anyone, would invariably produce the same illness; or, to put it rather less extravagantly, to demonstrate the existence of certain chemical substances the administration of which would bring about or cure particular neuroses. But the probability of a solution of this kind seems slight.

Psycho-analysis leads to less simple and satisfactory conclusions. What I have to say in this connection has long been familiar and I have nothing new to add. If the ego succeeds in protecting itself from a dangerous instinctual impulse, through, for instance, the process of repression, it has certainly inhibited and damaged the particular part of the id concerned; but it has at the same time given it some independence and has renounced some of its own sovereignty. This is inevitable from the nature of repression, which is, fundamentally, an attempt at flight. The repressed is now, as it were, an outlaw; it is excluded from the great organization of the ego and is subject only to the laws which govern the realm of the unconscious. If, now, the danger-situation changes so that the ego has no reason for fending off a new instinctual impulse analogous to the repressed one, the consequence of the restriction of the ego which has taken place will become manifest. The new impulse will run its course under an automatic influence - or, as I should prefer to say, under the influence of the compulsion to repeat. It will follow the same path as the earlier, repressed impulse, as though the danger-situation that had been overcome still existed. The fixating factor in repression, then, is the unconscious id's compulsion to repeat - a compulsion which in normal circumstances is only done away with by the freely mobile function of the ego. The ego may occasionally manage to break down the barriers of repression which it has itself put up and to recover its influence over the instinctual impulse and direct the course of the new impulse in accordance with the changed danger-situation. But in point of fact the ego very seldom succeeds in doing this: it cannot undo its repressions. It is possible that the way the struggle will go depends upon quantitative relations. In some cases one has the impression that the outcome is an enforced one: the regressive attraction exerted by the repressed impulse and the strength of the repression are so great that the new impulse has no choice but to obey the compulsion to repeat. In other cases we perceive a contribution from another play of forces: the attraction exerted by the repressed prototype is reinforced by a repulsion coming from the direction of difficulties in real life which stand in the way of any different course that might be taken by the new instinctual impulse.

That this is a correct account of fixation upon repression and of the retention of danger-situations that are no longer present-day ones is confirmed by the fact of analytic therapy - a fact which is modest enough in itself but which can hardly be overrated from a theoretical point of view. When, in analysis, we have given the ego assistance which is able to put it in a position to lift its repressions, it recovers its power over the repressed id and can allow the instinctual impulses to run their course as though the old situations of danger no longer existed. What we can do in this way tallies with what can be achieved in other fields of medicine; for as a rule our therapy must be content with bringing about more quickly, more reliably and with less expenditure of energy than would otherwise be the case the good result which in favourable circumstances would have occurred of itself.

We see from what has been said that *quantitative*—relations - relations which are not directly observable but which can only be inferred - are what determine whether or not old situations of danger shall be preserved, repressions on the part of the ego maintained and childhood neuroses find a continuation. Among the factors that play a part in the causation of neuroses and that have created the conditions under which the forces of the mind are pitted against one another, three emerge into prominence: a biological, a phylogenetic and a purely psychological factor.

The biological factor is the long period of time during which the young of the human species is in a condition of helplessness and dependence. Its intra-uterine existence seems to be short in comparison with that of most animals, and it is sent into the world in a less finished state. As a result, the influence of the real external world upon it is intensified and an early differentiation between the ego and the id is promoted. Moreover, the dangers of the external world have a greater importance for it, so that the value of the object which can alone protect it against them and take the place of its former intra-uterine life is enormously enhanced. The biological factor, then, establishes the earliest situations of danger and creates the need to be loved which will accompany the child through the rest of its life.

The existence of the second, phylogenetic, factor, is based only upon inference. We have been led to assume its existence by a remarkable feature in the development of the libido. We have found that the sexual life of man, unlike that of most of the animals nearly related to him, does not make a steady advance from birth to maturity, but that, after an early efflorescence up till the fifth year, it undergoes a very decided interruption; and that it then starts on its course once more at puberty, taking up again the beginnings broken off in early childhood. This has led us to suppose that something momentous must have occurred in the vicissitudes of the human species which has left behind this interruption in the sexual development of the individual as a historical precipitate. This factor owes its pathogenic significance to the fact that the majority of the instinctual demands of this infantile sexuality are treated by the ego as dangers and fended off as such, so that the later sexual impulses of puberty, which in the natural course of things would be ego-syntonic, run the risk of succumbing to the attraction of their infantile prototypes and following them into repression. It is here that we come upon the most direct aetiology of the neuroses. It is a curious thing that early contact with the demands of sexuality should have a similar effect on the ego to that produced by premature contact with the external world.

The third, psychological, factor resides in a defect of our mental apparatus which has to do precisely with its differentiation into an id and an ego, and which is therefore also attributable ultimately to the influence of the external world. In view of the dangers of reality, the ego is obliged to guard against certain instinctual impulses in the id and to treat them as dangers. But it cannot protect itself from internal instinctual dangers as effectively as it can from some piece of reality that is not part of itself. Intimately bound up with the id as it is, it can only fend off an instinctual danger by restricting its own organization and by acquiescing in the formation of symptoms in exchange for having impaired the instinct. If the rejected instinct renews its attack, the ego is overtaken by all those difficulties which are known to us as neurotic ailments.

Further than this, I believe, our knowledge of the nature and causes of neurosis has not as yet been able to go.

XI

ADDENDA

In the course of this discussion various themes have had to be put aside before they had been fully dealt with. I have brought them together in this chapter so that they may receive the attention they deserve.

A

MODIFICATIONS OF EARLIER VIEWS

(a) Resistance and Anticathexis

An important element in the theory of repression is the view that repression is not an event that occurs once but that it requires a permanent expenditure. If this expenditure were to cease, the repressed impulse, which is being fed all the time from its sources, would on the next occasion flow along the channels from which it had been forced away, and the repression would either fail in its purpose or would have to be repeated an indefinite number of times. Thus it is because instincts are continuous in their nature that the ego has to make its defensive action secure by a permanent expenditure. This action undertaken to protect repression is observable in analytic treatment as *resistance*. Resistance presupposes the existence of what I have called *anticathexis*. An anticathexis of this kind is clearly seen in obsessional neurosis. It appears there in the form of an alteration of the ego, as a reaction-formation in the ego, and is effected by the reinforcement of the attitude which is the opposite of the instinctual trend that has to be repressed - as, for instance, in pity, conscientiousness and cleanliness. These reaction-formations of obsessional neurosis are essentially exaggerations of the normal traits of character which develop during the latency period. The presence of an anticathexis in hysteria is much more difficult to detect, though theoretically it is equally indispensable. In hysteria, too, a certain amount of alteration of the ego through reaction-formation is unmistakable and in some circumstances becomes so marked that it forces itself on our attention as the principal symptom. The conflict due to ambivalence, for instance, is resolved in hysteria by this means. The subject's hatred of a person whom he loves is kept down by an exaggerated amount of tenderness for him and apprehensiveness about him. But the difference between reaction-formations in obsessional neurosis and in hysteria is that in the latter they do not have the universality of a character-trait but are confined to particular relationships. A hysterical woman, for instance, may be specially affectionate with her own children whom at bottom she hates; but she will not on that account be more loving in general than other women or even more affectionate to other children. The reaction-formation of hysteria clings tenaciously to a particular object and never spreads over into a general disposition of the ego, whereas what is characteristic of obsessional neurosis is precisely a spreading-over of this kind - a loosening of relations to the object and a facilitation of displacement in the choice of object.

There is another kind of anticathexis, however, which seems more suited to the peculiar character of hysteria. A repressed instinctual impulse can be activated (newly cathected) from two directions: from within, through reinforcement from its internal sources of excitation, and from without, through the perception of an object that it desires. The hysterical anticathexis is mainly directed outwards, against dangerous perceptions. It takes the form of a special kind of vigilance which, by means of restrictions of the ego, causes situations to be avoided that would entail such perceptions, or, if they do occur, manages to withdraw the subject's attention from them. Some French analysts, in particular Laforque, have recently given this action of hysteria the special name of 'scotomization'. This technique of anticathexis is still more noticeable in the phobias, whose interest is concentrated on removing the subject ever further from the possibility of the occurrence of the feared perception. The fact that anticathexis has an opposite direction in hysteria and the phobias from what it has in obsessional neurosis - though the distinction is not an absolute one - seems to be significant. It suggests that there is an intimate connection between repression and external anticathexis on the one hand and between regression and internal anticathexis (i.e. alteration in the ego through reaction-formation) on the other. The task of defence against a dangerous perception is, incidentally, common to all neuroses. Various commands and prohibitions in obsessional neurosis have the same end in view.

We showed on an earlier occasion that the resistance that has to be overcome in analysis proceeds from the ego, which clings to its antitheses. It is hard for the ego to direct its attention to perceptions and ideas which it has up till now made a rule of avoiding, or to acknowledge as belonging to itself impulses that are the complete opposite of those which it knows as its own. Our fight against resistance in analysis is based upon this view of the facts. If the resistance is itself unconscious, as so often happens owing to its connection with the repressed material, we make it conscious. If it is conscious, or when it has become conscious, we bring forward logical arguments against it; we promise the ego rewards and advantages if it will give up its resistance. There can be no doubt or mistake about the existence of this resistance on the part of the ego. But we have to ask ourselves whether it covers the whole state of affairs in analysis. For we find that even after the ego has decided to relinquish its resistances it still has difficulty in undoing the repressions; and we have called the period of strenuous effort which follows after its praiseworthy decision, the phase of 'working-through'. The dynamic factor which makes a working-through of this kind necessary and comprehensible is not far to seek. It must be that after the ego's resistance has been removed the power of the compulsion to repeat - the attraction exerted by the unconscious prototype upon the repressed instinctual process - has still to be overcome. There is nothing to be said against describing this factor as the *resistance of the unconscious*. There is no need to be discouraged by these emendations. They are to be welcomed if they add something to our knowledge, and they are no disgrace to us so long as they enrich rather than invalidate our earlier views - by limiting some statement, perhaps, that was too general or by enlarging some idea that was too narrowly formulated.

It must not be supposed that these emendations provide us with a complete survey of all the kinds of resistance that are met with in analysis. Further investigation of the subject shows that the analyst has to combat no less than five kinds of resistance, emanating from three directions - the ego, the id and the super-ego. The ego is the source of three of these, each differing in its dynamic nature. The first of these three ego-resistances is the *repression* resistance, which we have already discussed above and about which there is least new to be added. Next there is the *transference* resistance, which is of the same nature but which has different and much clearer effects in analysis, since it succeeds in establishing a relation to the analytic situation or the analyst himself and thus re-animating a repression which should only have been recollected. The third resistance, though also an ego-resistance, is of quite a different nature. It proceeds from the *gain from illness* and is based upon an assimilation of the symptom into the ego. It represents an unwillingness to renounce any satisfaction or relief that has been obtained. The fourth variety, arising from the *id*, is the resistance which, as we have just seen, necessitates 'working-through'. The fifth, coming from the *super-ego* and the last to be discovered, is also the most obscure though not always the least powerful one. It seems to originate from the sense of guilt or the need for punishment; and it opposes every move towards success, including, therefore, the patient's own recovery through analysis.

(b) Anxiety from Transformation of Libido

The view of anxiety which I have put forward in these pages diverges somewhat from the one I have hitherto thought correct. Formerly I regarded anxiety as a general reaction of the ego under conditions of unpleasure. I always sought to justify its appearance on economic grounds and I assumed, on the strength of my investigations into the 'actual' neuroses, that libido (sexual excitation) which was rejected or not utilized by the ego found direct discharge in the form of anxiety. It cannot be denied that these various assertions did not go very well together, or at any rate did not necessarily follow from one another. Moreover, they gave the impression of there being a specially intimate connection between anxiety and libido and this did not accord with the general character of anxiety as a reaction to unpleasure.

The objection to this view arose from our coming to regard the ego as the sole seat of anxiety. It was one of the results of the attempt at a structural division of the mental apparatus which I made in *The Ego and the Id*. Whereas the old view made it natural to suppose that anxiety arose from the libido belonging to the repressed instinctual impulses, the new one, on the contrary, made the ego the source of anxiety. Thus it is a question of instinctual (id-) anxiety or ego-anxiety. Since the energy which the ego employs is desexualized, the new view also tended to weaken the close connection between anxiety and libido. I hope I have at least succeeded in making the contradiction plain and in giving a clear idea of the point in doubt.

Rank's contention - which was originally my own -, that the affect of anxiety is a consequence of the event of birth and a repetition of the situation then experienced, obliged me to review the problem of anxiety once more. But I could make no headway with his idea that birth is a trauma, states of anxiety a reaction of discharge to it and all subsequent affects of anxiety an attempt to 'abreact' it more and more completely. I was obliged to go back from the anxiety reaction to the *situation of danger* that lay behind it. The introduction of this element opened up new aspects of the question. Birth was seen to be the prototype of all later situations of danger which overtook the individual under the new conditions arising from a changed mode of life and a growing mental development. On the other hand its own significance was reduced to this prototypic relationship to danger. The anxiety felt at birth became the prototype of an affective state which had to undergo the same vicissitudes as the other affects. Either the state of anxiety reproduced itself *automatically* in situations analogous to the original situation and was thus an inexpedient form of reaction instead of an expedient one as it had been in the first situation of danger; or the ego acquired power over this affect, reproduced it on its own initiative, and employed it as a warning of danger and as a means of setting the pleasure-unpleasure mechanism in motion. We thus gave the biological aspect of the anxiety affect its due importance by recognizing anxiety as the general reaction to situations of danger; while we endorsed the part played by the ego as the seat of anxiety by allocating to it the function of producing the anxiety affect according to its needs. Thus we attributed two modes of origin to anxiety in later life. One was involuntary, automatic and always justified on economic grounds, and arose whenever a danger situation analogous to birth had established itself. The other was produced by the ego as soon as a situation of this kind merely threatened to occur, in order to call for its avoidance. In the second case the ego subjects itself to anxiety as a sort of inoculation, submitting to a slight attack of the illness in order to escape its full strength. It vividly imagines the danger situation, as it were, with the unmistakable purpose of restricting that distressing experience to a mere indication, a signal. We have already seen in detail how the various situations of danger arise one after the other, retaining at the same time a genetic connection.

We shall perhaps be able to proceed a little further in our understanding of anxiety when we turn to the problem of the relation between neurotic anxiety and realistic anxiety.

Our former hypothesis of a direct transformation of libido into anxiety possesses less interest for us now than it did. But if we do nevertheless consider it, we shall have to distinguish different cases. As regards anxiety evoked by the ego as a signal, it does not come into consideration; nor does it, therefore, in any of those danger-situations which move the ego to bring on repression. The libidinal cathexis of the repressed instinctual impulse is employed otherwise than in being transformed into anxiety and discharged as such - as is most clearly seen in conversion hysteria. On the other hand, further enquiry into the question of the danger-situation will bring to our notice an instance of the production of anxiety which will, I think, have to be accounted for in a different way.

(c) *Repression and Defence*

In the course of discussing the problem of anxiety I have revived a concept or, to put it more modestly, a term, of which I made exclusive use thirty years ago when I first began to study the subject but which I later abandoned. I refer to the term 'defensive process'.¹ I afterwards replaced it by the word 'repression', but the relation between the two remained uncertain. It will be an undoubted advantage, I think, to revert to the old concept of 'defence', provided we employ it explicitly as a general designation for all the techniques which the ego makes use of in conflicts which may lead to a neurosis, while we retain the word 'repression' for the special method of defence which the line of approach taken by our investigations made us better acquainted with in the first instance.

Even a purely terminological innovation ought to justify its adoption; it ought to reflect some new point of view or some extension of knowledge. The revival of the concept of defence and the restriction of that of repression takes into account a fact which has long since been known but which has received added importance owing to some new discoveries. Our first observations of repression and of the formation of symptoms were made in connection with hysteria. We found that the perceptual content of exciting experiences and the ideational content of pathogenic structures of thought were forgotten and debarred from being reproduced in memory, and we therefore concluded that the keeping away from consciousness was a main characteristic of hysterical repression. Later on, when we came to study the obsessional neuroses, we found that in that illness pathogenic occurrences are not forgotten. They remain conscious but they are 'isolated' in some way that we cannot as yet grasp, so that much the same result is obtained as in hysterical amnesia. Nevertheless the difference is great enough to justify the belief that the process by which instinctual demands are set aside in obsessional neurosis cannot be the same as in hysteria. Further investigations have shown that in obsessional neurosis a regression of the instinctual impulses to an earlier libidinal stage is brought about through the opposition of the ego, and that this regression, although it does not make repression unnecessary, clearly works in the same sense as repression. We have seen, too, that in obsessional neurosis anticathexis, which is also presumably present in hysteria, plays a specially large part in protecting the ego by effecting a reactive alteration in it. Our attention has, moreover, been drawn to a process of 'isolation' (whose technique cannot as yet be elucidated) which finds direct symptomatic manifestation, and to a procedure, that may be called magical, of 'undoing' what has been done - a procedure about whose defensive purpose there can be no doubt, but which has no longer any resemblance to the process of 'repression'. These observations provide good enough grounds for re-introducing the old concept of *defence*, which can cover all these processes that have the same purpose - namely, the protection of the ego against instinctual demands - and for subsuming repression under it as a special case. The importance of this nomenclature is heightened if we consider the possibility that further investigations may show that there is an intimate connection between special forms of defence and particular illnesses, as, for instance, between repression and hysteria. In addition we may look forward to the possible discovery of yet another important correlation. It may well be that before its sharp cleavage into an ego and an id, and before the formation of a super-ego, the mental apparatus makes use of different methods of defence from those which it employs after it has reached these stages of organization.

¹ Cf. 'The Neuro-Psychoses of Defence' (1894a).

B

SUPPLEMENTARY REMARKS ON ANXIETY

The affect of anxiety exhibits one or two features the study of which promises to throw further light on the subject. Anxiety has an unmistakable relation to *expectation*: it is anxiety *about* something. It has a quality of *indefiniteness and lack of object*. In precise speech we use the word 'fear' rather than 'anxiety' if it has found an object. Moreover, in addition to its relation to danger, anxiety has a relation to neurosis which we have long been trying to elucidate. The question arises: why are not all reactions of anxiety neurotic - why do we accept so many of them as normal? And finally the problem of the difference between realistic anxiety and neurotic anxiety awaits a thorough examination.

To begin with the last problem. The advance we have made is that we have gone behind reactions of anxiety to situations of danger. If we do the same thing with realistic anxiety we shall have no difficulty in solving the question. Real danger is a danger that is known, and realistic anxiety is anxiety about a known danger of this sort. Neurotic anxiety is anxiety about an unknown danger. Neurotic danger is thus a danger that has still to be discovered. Analysis has shown that it is an instinctual danger. By bringing this danger which is not known to the ego into consciousness, the analyst makes neurotic anxiety no different from realistic anxiety, so that it can be dealt with in the same way.

There are two reactions to real danger. One is an affective reaction, an outbreak of anxiety. The other is a protective action. The same will presumably be true of instinctual danger. We know how the two reactions can co-operate in an expedient way, the one giving the signal for the other to appear. But we also know that they can behave in an inexpedient way: paralysis from anxiety may set in, and the one reaction spread at the cost of the other.

In some cases the characteristics of realistic anxiety and neurotic anxiety are mingled. The danger is known and real but the anxiety in regard to it is over-great, greater than seems proper to us. It is this surplus of anxiety which betrays the presence of a neurotic element. Such cases, however, introduce no new principle; for analysis shows that to the known real danger an unknown instinctual one is attached.

We can find out still more about this if, not content with tracing anxiety back to danger, we go on to enquire what the essence and meaning of a danger-situation is. Clearly, it consists in the subject's estimation of his own strength compared to the magnitude of the danger and in his admission of helplessness in the face of it - physical helplessness if the danger is real and psychical helplessness if it is instinctual. In doing this he will be guided by the actual experiences he has had. (Whether he is wrong in his estimation or not is immaterial for the outcome.) Let us call a situation of helplessness of this kind that has been actually experienced a *traumatic situation*. We shall then have good grounds for distinguishing a traumatic situation from a danger-situation.

The individual will have made an important advance in his capacity for self-preservation if he can foresee and expect a traumatic situation of this kind which entails helplessness, instead of simply waiting for it to happen. Let us call a situation which contains the determinant for such an expectation a danger-situation. It is in this situation that the signal of anxiety is given. The signal announces: 'I am expecting a situation of helplessness to set in', or: 'The present situation reminds me of one of the traumatic experiences I have had before. Therefore I will anticipate the trauma and behave as though it had already come, while there is yet time to turn it aside.' Anxiety is therefore on the one hand an expectation of a trauma, and on the other a repetition of it in a mitigated form. Thus the two features of anxiety which we have noted have a different origin. Its connection with expectation belongs to the danger-situation, whereas its indefiniteness and lack of object belong to the traumatic situation of helplessness - the situation which is anticipated in the danger-situation.

Taking this sequence, anxiety - danger - helplessness (trauma), we can now summarize what has been said. A danger-situation is a recognized, remembered, expected situation of helplessness. Anxiety is the original reaction to helplessness in the trauma and is reproduced later on in the danger-situation as a signal for help. The ego, which experienced the trauma passively, now repeats it actively in a weakened version, in the hope of being able itself to direct its course. It is certain that children behave in this fashion towards every distressing impression they receive, by reproducing it in their play. In thus changing from passivity to activity they attempt to master their experiences psychically. If this is what is meant by 'abreacting a trauma' we can no longer have anything to urge against the phrase. But what is of decisive importance is the first displacement of the anxiety-reaction from its origin in the situation of helplessness to an expectation of that situation - that is, to the danger-situation. After that come the later displacements, from the danger to the determinant of the danger - loss of the object and the modifications of that loss with which we are already acquainted.

The undesirable result of 'spoiling' a small child is to magnify the importance of the danger of losing the object (the object being a protection against every situation of helplessness) in comparison with every other danger. It therefore encourages the individual to remain in the state of childhood, the period of life which is characterized by motor and psychical helplessness.

So far we have had no occasion to regard realistic anxiety in any different light from neurotic anxiety. We know what the distinction is. A real danger is a danger which threatens a person from an external object, and a neurotic danger is one which threatens him from an instinctual demand. In so far as the instinctual demand is something real, his neurotic anxiety, too, can be admitted to have a realistic basis. We have seen that the reason why there seems to be a specially close connection between anxiety and neurosis is that the ego defends itself against an instinctual danger with the help of the anxiety reaction just as it does against an external real danger, but that this line of defensive activity eventuates in a neurosis owing to an imperfection of the mental apparatus. We have also come to the conclusion that an instinctual demand often only becomes an (internal) danger because its satisfaction would bring on an external danger - that is, because the internal danger represents an external one.

On the other hand, the external (real) danger must also have managed to become internalized if it is to be significant for the ego. It must have been recognized as related to some situation of helplessness that has been experienced.¹ Man seems not to have been endowed, or to have been endowed to only a very small degree, with an instinctive recognition of the dangers that threaten him from without. Small children are constantly doing things which endanger their lives, and that is precisely why they cannot afford to be without a protecting object. In relation to the traumatic situation, in which the subject is helpless, external and internal dangers, real dangers and instinctual demands converge. Whether the ego is suffering from a pain which will not stop or experiencing an accumulation of instinctual needs which cannot obtain satisfaction, the economic situation is the same, and the motor helplessness of the ego finds expression in psychical helplessness.

In this connection the puzzling phobias of early childhood deserve to be mentioned once again. We have been able to explain some of them, such as the fear of being alone or in the dark or with strangers, as reactions to the danger of losing the object. Others, like the fear of small animals, thunder storms, etc., might perhaps be accounted for as vestigial traces of the congenital preparedness to meet real dangers which is so strongly developed in other animals. In man, only that part of this archaic heritage is appropriate which has reference to the loss of the object. If childhood phobias become fixated and grow stronger and persist into later years, analysis shows that their content has become associated with instinctual demands and has come to stand for internal dangers as well.

¹ It may quite often happen that although a danger-situation is correctly estimated in itself, a certain amount of instinctual anxiety is added to the realistic anxiety. In that case the instinctual demand before whose satisfaction the ego recoils is a masochistic one: the instinct of destruction directed against the subject himself. Perhaps an addition of this kind explains cases in which reactions of anxiety are exaggerated, inexpedient or paralysing. Phobias of heights (windows, towers, precipices and so on) may have some such origin. Their hidden feminine significance is closely connected with masochism.

C

ANXIETY, PAIN AND MOURNING

So little is known about the psychology of emotional processes that the tentative remarks I am about to make on the subject may claim a very lenient judgement. The problem before us arises out of the conclusion we have reached that anxiety comes to be a reaction to the danger of a loss of an object. Now we already know one reaction to the loss of an object, and that is mourning. The question therefore is, when does that loss lead to anxiety and when to mourning? In discussing the subject of mourning on a previous occasion I found that there was one feature about it which remained quite unexplained. This was its peculiar painfulness.¹ And yet it seems self-evident that separation from an object should be painful. Thus the problem becomes more complicated: when does separation from an object produce anxiety, when does it produce mourning and when does it produce, it may be, only pain?

Let me say at once that there is no prospect in sight of answering these questions. We must content ourselves with drawing certain distinctions and adumbrating certain possibilities.

Our starting-point will again be the one situation which we believe we understand - the situation of the infant when it is presented with a stranger instead of its mother. It will exhibit the anxiety which we have attributed to the danger of loss of object. But its anxiety is undoubtedly more complicated than this and merits a more thorough discussion. That it does have anxiety there can be no doubt; but the expression of its face and its reaction of crying indicate that it is feeling pain as well. Certain things seem to be joined together in it which will later on be separated out. It cannot as yet distinguish between temporary absence and permanent loss. As soon as it loses sight of its mother it behaves as if it were never going to see her again; and repeated consoling experiences to the contrary are necessary before it learns that her disappearance is usually followed by her re-appearance. Its mother encourages this piece of knowledge which is so vital to it by playing the familiar game of hiding her face from it with her hands and then, to its joy, uncovering it again. In these circumstances it can, as it were, feel longing unaccompanied by despair.

¹ 'Mourning and Melancholia' (1917e).

In consequence of the infant's misunderstanding of the facts, the situation of missing its mother is not a danger-situation but a traumatic one. Or, to put it more correctly, it is a traumatic situation if the infant happens at the time to be feeling a need which its mother should be the one to satisfy. It turns into a danger-situation if this need is not present at the moment. Thus, the first determinant of anxiety, which the ego itself introduces, is loss of perception of the object (which is equated with loss of the object itself). There is as yet no question of loss of love. Later on, experience teaches the child that the object can be present but angry with it; and then loss of love from the object becomes a new and much more enduring danger and determinant of anxiety.

The traumatic situation of missing the mother differs in one important respect from the traumatic situation of birth. At birth no object existed and so no object could be missed. Anxiety was the only reaction that occurred. Since then repeated situations of satisfaction have created an object out of the mother; and this object, whenever the infant feels a need, receives an intense cathexis which might be described as a 'longing' one. It is to this new aspect of things that the reaction of pain is referable. Pain is thus the actual reaction to loss of object, while anxiety is the reaction to the danger which that loss entails and, by a further displacement, a reaction to the danger of the loss of object itself.

We know very little about pain either. The only fact we are certain of is that pain occurs in the first instance and as a regular thing whenever a stimulus which impinges on the periphery breaks through the devices of the protective shield against stimuli and proceeds to act like a continuous instinctual stimulus, against which muscular action, which is as a rule effective because it withdraws the place that is being stimulated from the stimulus, is powerless. If the pain proceeds not from a part of the skin but from an internal organ, the situation is still the same. All that has happened is that a portion of the inner periphery has taken the place of the outer periphery. The child obviously has occasion to undergo experiences of pain of this sort, which are independent of its experiences of need. This determinant of the generating of pain seems, however, to have very little similarity with the loss of an object. And besides, the element which is essential to pain, peripheral stimulation, is entirely absent in the child's situation of longing. Yet it cannot be for nothing that the common usage of speech should have created the notion of internal, mental pain and have treated the feeling of loss of object as equivalent to physical pain.

When there is physical pain, a high degree of what may be termed narcissistic cathexis of the painful place occurs. This cathexis continues to increase and tends, as it were, to empty the ego. It is well known that when internal organs are giving us pain we receive spatial and other presentations of parts of the body which are ordinarily not represented at all in conscious ideation. Again, the remarkable fact that, when there is a psychical diversion brought about by some other interest, even the most intense physical pains fail to arise (I must not say 'remain unconscious' in this case) can be accounted for by there being a concentration of cathexis on the psychical representative of the part of the body which is giving pain. I think it is here that we shall find the point of analogy which has made it possible to carry sensations of pain over to the mental sphere. For the intense cathexis of longing which is concentrated on the missed or lost object (a cathexis which steadily mounts up because it cannot be appeased) creates the same economic conditions as are created by the cathexis of pain which is concentrated on the injured part of the body. Thus the fact of the peripheral causation of physical pain can be left out of account. The transition from physical pain to mental pain corresponds to a change from narcissistic cathexis to object-cathexis. An object-presentation which is highly cathected by instinctual need plays the same role as a part of the body which is cathected by an increase of stimulus. The continuous nature of the cathectic process and the impossibility of inhibiting it produce the same state of mental helplessness. If the feeling of unpleasure which then arises has the specific character of pain (a character which cannot be more exactly described) instead of manifesting itself in the reactive form of anxiety, we may plausibly attribute this to a factor which we have not sufficiently made use of in our explanations - the high level of cathexis and 'binding' that prevails while these processes which lead to a feeling of unpleasure take place.

We know of yet another emotional reaction to the loss of an object, and that is mourning. But we have no longer any difficulty in accounting for it. Mourning occurs under the influence of reality-testing; for the latter function demands categorically from the bereaved person that he should separate himself from the object, since it no longer exists. Mourning is entrusted with the task of carrying out this retreat from the object in all those situations in which it was the recipient of a high degree of cathexis. That this separation should be painful fits in with what we have just said, in view of the high and unsatisfiable cathexis of longing which is concentrated on the object by the bereaved person during the reproduction of the situations in which he must undo the ties that bind him to it.

THE QUESTION OF LAY ANALYSIS

CONVERSATIONS WITH AN IMPARTIAL PERSON

INTRODUCTION

The title of this small work is not immediately intelligible. I will therefore explain it. 'Layman' = 'Non-doctor'; and the question is whether non-doctors as well as doctors are to be allowed to practise analysis. This question has its limitations both in time and place. In *time*, because up to now no one has been concerned as to *who* practises analysis. Indeed, people have been much too little concerned about it - the one thing they were agreed on was a wish that *no one* should practise it. Various reasons were given for this, but they were based on the same underlying distaste. Thus the demand that only doctors should analyse corresponds to a new and apparently more friendly attitude to analysis - if, that is, it can escape the suspicion of being after all only a slightly modified derivative of the earlier attitude. It is conceded that in some circumstances an analytic treatment shall be undertaken; but, if so, only doctors are to undertake it. The reason for this restriction then becomes a matter for enquiry.

The question is limited in *place* because it does not arise in all countries with equal significance. In Germany and America it would be no more than an academic discussion; for in those countries every patient can have himself treated how and by whom he chooses, and anyone who chooses can, as a 'quack', handle any patients, provided only that he undertakes the responsibility for his actions. The law does not intervene until it is called in to expiate some injury done to the patient. But in Austria, in which and for which I am writing, there is a preventive law, which forbids non-doctors from undertaking the treatment of patients, without waiting for its outcome.¹ So here the question whether laymen (= non-doctors) may treat patients by psycho-analysis has a practical sense. As soon as it is raised, however, it appears to be settled by the wording of the law. Neurotics are patients, laymen are non-doctors, psycho-analysis is a procedure for curing or improving nervous disorders, and all such treatments are reserved to doctors. It follows that laymen are not permitted to practise analysis on neurotics, and are punishable if they nevertheless do so. The position being so simple, one hardly ventures to take up the question of lay analysis. All the same, there are some complications, which the law does not trouble about, but which nevertheless call for consideration. It may perhaps turn out that in this instance the patients are not like other patients, that the laymen are not really laymen, and that the doctors have not exactly the qualities which one has a right to expect of doctors and on which their claims should be based. If this can be proved, there will be justifiable grounds for demanding that the law shall not be applied without modification to the instance before us.

¹ The same holds good in France.

I

Whether this happens will depend on people who are not obliged to be familiar with the peculiarities of an analytic treatment. It is our task to give information on the subject to these impartial persons, whom we shall assume to be, at the moment, still in ignorance. It is to be regretted that we cannot let them be present as an audience at a treatment of this kind. But the 'analytic situation' allows of the presence of no third person. Moreover the different sessions are of very unequal value. An unauthorized listener who hit upon a chance one of them would as a rule form no useful impression; he would be in danger of not understanding what was passing between the analyst and the patient, or he would be bored. For good or ill, therefore, he must be content with our information, which we shall try to make as trustworthy as possible.

A patient, then, may be suffering from fluctuations in his moods which he cannot control, or from a sense of despondency by which his energy feels paralysed because he thinks he is incapable of doing anything properly, or from a nervous embarrassment among strangers. He may perceive, without understanding the reason for it, that he has difficulties in carrying out his professional work, or indeed any comparatively important decision or any undertaking. He may one day have suffered from a distressing attack - unknown in its origin - of feelings of anxiety, and since then have been unable, without a struggle, to walk along the street alone, or to travel by train; he may perhaps have had to give up both entirely. Or, a very remarkable thing, his thoughts may go their own way and refuse to be directed by his will. They pursue problems that are quite indifferent to him, but from which he cannot get free. Quite ludicrous tasks, too, are imposed on him, such as counting up the windows on the fronts of houses. And when he has performed simple actions such as posting a letter or turning off a gas-jet, he finds himself a moment later doubting whether he has really done so. This may be no more than an annoyance and a nuisance. But his state becomes intolerable if he suddenly finds he is unable to fend off the idea that he has pushed a child under the wheels of a car or has thrown a stranger off the bridge into the water, or if he has to ask himself whether he is not the murderer whom the police are looking for in connection with a crime that was discovered that day. It is obvious nonsense, as he himself knows; he has never done any harm to anyone; but if he were really the murderer who is being looked for, his feeling - his sense of guilt - could not be stronger.

Or again our patient - and this time let us make her a woman - may suffer in another way and in a different field. She is a pianist, but her fingers are overcome by cramp and refuse to serve her. Or when she thinks of going to a party she promptly becomes aware of a call of nature the satisfaction of which would be incompatible with a social gathering. She has therefore given up going to parties, dances, theatres or concerts. She is overcome by violent headaches or other painful sensations at times when they are most inconvenient. She may even be unable to keep down any meal she eats which can become dangerous in the long run. And, finally, it is a lamentable fact that she cannot tolerate any agitations, which after all are inevitable in life. On such occasions she falls in a faint, often accompanied by muscular spasms that recall sinister pathological states.

Other patients, again, suffer from disturbances in a particular field in which emotional life converges with demands of a bodily sort. If they are men, they find they are incapable of giving physical expression to their tenderest feelings towards the opposite sex, while towards less loved objects they may perhaps have every reaction at their command. Or their sensual feelings attach them to people whom they despise and from whom they would like to get free; or those same feelings impose requirements on them whose fulfilment they themselves find repulsive. If they are women, they feel prevented by anxiety or disgust or by unknown obstructions from meeting the demands of sexual life; or, if they have surrendered to love, they find themselves cheated of the enjoyment which nature has provided as a reward for such compliance.

All these people recognize that they are ill and go to doctors, by whom people expect nervous disorders like these to be removed. The doctors, too, lay down the categories into which these complaints are divided. They diagnose them, each according to his own standpoint, under different names: neurasthenia, psychasthenia, phobias, obsessional neurosis, hysteria. They examine the organs which produce the symptoms, the heart, the stomach, the bowels, the genitals, and find them healthy. They recommend interruptions in the patient's accustomed mode of life, holidays, strengthening exercises, tonics, and by these means bring about temporary improvements - or no result at all. Eventually the patients hear that there are people who are concerned quite specially with the treatment of such complaints and start an analysis with them.

During this disquisition on the symptoms of neurotics, the Impartial Person, whom I imagine as being present, has been showing signs of impatience. At this point, however, he becomes attentive and interested. 'So now', he says, 'we shall learn what the analyst does with the patient whom the doctor has not been able to help.'

Nothing takes place between them except that they talk to each other. The analyst makes use of no instruments not even for examining the patient - nor does he prescribe any medicines. If it is at all possible, he even leaves the patient in his environment and in his usual mode of life during the treatment. This is not a necessary condition, of course, and may not always be practicable. The analyst agrees upon a fixed regular hour with the patient, gets him to talk, listens to him, talks to him in his turn and gets him to listen.

The Impartial Person's features now show signs of unmistakable relief and relaxation, but they also clearly betray some contempt. It is as though he were thinking: 'Nothing more than that? Words, words, words, as Prince Hamlet says.' And no doubt he is thinking too of Mephistopheles' mocking speech on how comfortably one can get along with words - lines that no German will ever forget.

'So it is a kind of magic,' he comments: 'you talk, and blow away his ailments.'

Quite true. It *would* be magic if it worked rather quicker. An essential attribute of a magician is speed - one might say suddenness - of success. But analytic treatments take months and even years: magic that is so slow loses its miraculous character. And incidentally do not let us despise the *word*. After all it is a powerful instrument; it is the means by which we convey our feelings to one another, our method of influencing other people. Words can do unspeakable good and cause terrible wounds. No doubt 'in the beginning was the deed' and the word came later; in some circumstances it meant an advance in civilization when deeds were softened into words. But originally the word was magic - a magical act; and it has retained much of its ancient power.

The Impartial Person proceeds: 'Let us suppose that the patient is no better prepared to understand analytic treatment than I am; then how are you going to make him believe in the magic of the word or of the speech that is to free him from his sufferings?'

Some preparation must of course be given to him; and there is a simple way of doing it. We call on him to be completely straightforward with his analyst, to keep nothing back intentionally that comes into his head, and then to put aside *every* reservation that might prevent his reporting certain thoughts or memories. Everyone is aware that there are some things in himself that he would be very unwilling to tell other people or that he considers it altogether out of the question to tell. These are his 'intimacies'. He has a notion too - and this represents a great advance in psychological self-knowledge - that there are other things that one would not care to admit *to oneself*: things that one likes to conceal from oneself and which for that reason one breaks off short and drives out of one's thoughts if, in spite of everything, they turn up. Perhaps he may himself notice that a very remarkable psychological problem begins to appear in this situation - of a thought of his own being kept secret from his own self. It looks as though his own self were no longer the unity which he had always considered it to be, as though there were something else as well in him that could confront that self. He may become obscurely aware of a contrast between a self and a mental life in the wider sense. If now he accepts the demand made by analysis that he shall say everything, he will easily become accessible to an expectation that to have relations and exchanges of thought with someone under such unusual conditions might also lead to peculiar results.

'I understand,' says our Impartial Person. 'You assume that every neurotic has something oppressing him, some secret. And by getting him to tell you about it you relieve his oppression and do him good. That, of course, is the principle of Confession, which the Catholic Church has used from time immemorial in order to make secure its dominance over people's minds.'

We must reply: 'Yes and no!' Confession no doubt plays a part in analysis - as an introduction to it, we might say. But it is very far from constituting the essence of analysis or from explaining its effects. In Confession the sinner tells what he knows; in analysis the neurotic has to tell more. Nor have we heard that Confession has ever developed enough power to get rid of actual pathological symptoms.

'Then, after all, I do not understand,' comes the rejoinder. 'What can you possibly mean by "telling more than he knows"? But I can well believe that as an analyst you gain a stronger influence over your patients than a Father Confessor over his penitents, since your contacts with him are so much longer, more intensive and also more individual, and since you use this increased influence to divert him from his sick thoughts, to talk him out of his fears, and so on. It would certainly be strange if it were possible by such means to control purely physical phenomena as well, such as vomiting, diarrhoea, convulsions; but I know that influence like that is in fact quite possible if a person is put into a state of hypnosis. By the trouble you take with the patient you probably succeed in bringing about a hypnotic relation of that sort with him - a suggestive attachment to yourself - even though you may not intend to; and in that case the miraculous results of your treatment are the effect of hypnotic suggestion. But, so far as I know, hypnotic treatment works much faster than your analysis, which, as you tell me, lasts for months and years.'

Our Impartial Person cannot be either so ignorant or so perplexed as we thought to begin with. There are unmistakable signs that he is trying to understand psycho-analysis with the help of his previous knowledge, that he is trying to link it up with something he already knows. The difficult task now lies ahead of us of making it clear to him that he will not succeed in this: that analysis is a procedure *sui generis*, something novel and special, which can only be understood with the help of *new* insights - or hypotheses, if that sounds better. But he is still waiting for our answer to his last remarks.

What you say about the special personal influence of the analyst certainly deserves great attention. An influence of the kind exists and plays a large part in analysis - but not the same part as in hypnotism. It ought to be possible to convince you that the situations in the two cases are quite different. It may be enough to point out that we do not use this personal influence, the factor of 'suggestion', to suppress the symptoms of the illness, as happens with *hypnotic* suggestion. Further, it would be a mistake to believe that this factor is the vehicle and promoter of the treatment throughout its length. At its beginning, no doubt. But later on it opposes our analytic intentions and forces us to adopt the most far-reaching counter-measures. And I should like to show by an example how far diverting a patient's thoughts and talking him out of things are from the technique of analysis. If a patient of ours is suffering from a sense of guilt, as though he had committed a serious crime, we do not recommend him to disregard his qualms of conscience and do not emphasize his undoubted innocence; he himself has often tried to do so without success. What we do is to remind him that such a strong and persistent feeling must after all be based on something real, which it may perhaps be possible to discover.

'It would surprise me', comments the Impartial Person, 'if you were able to soothe your patients by agreeing with their sense of guilt in that way. But what *are* your analytic intentions? and what *do* you do with your patients?'

II

If I am to say anything intelligible to you, I shall no doubt have to tell you something of a psychological theory which is not known or not appreciated outside analytic circles. It will be easy to deduce from this theory what we want from our patients and how we obtain it. I shall expound it to you dogmatically, as though it were a complete theoretical structure. But do not suppose that it came into being as such a structure, like a philosophical system. We have developed it very slowly, we have wrestled over every small detail of it, we have unceasingly modified it, keeping a continuous contact with observation, till it has finally taken a shape in which it seems to suffice for our purposes. Only a few years ago I should have had to clothe this theory in other terms. Nor, of course, can I guarantee to you that the form in which it is expressed to-day will remain the final one. Science, as you know, is not a revelation; long after its beginnings it still lacks the attributes of definiteness, immutability and infallibility for which human thought so deeply longs. But such as it is, it is all that we can have. If you will further bear in mind that our science is very young, scarcely as old as the century, and that it is concerned with what is perhaps the most difficult material that can be the subject of human research, you will easily be able to adopt the correct attitude towards my exposition. But interrupt me whenever you feel inclined, if you cannot follow me or if you want further explanations.

‘I will interrupt you before you have even begun. You say that you intend to expound a new psychology to me; but I should have thought that psychology was no new science. There have been psychologies and psychologists enough; and I heard of great achievements in that field while I was at college.’

I should not dream of disputing them. But if you look into the matter more closely you will have to class these great achievements as belonging rather to the physiology of the sense organs. The theory of mental life could not be developed, because it was inhibited by a single essential misunderstanding. What does it comprise to-day, as it is taught at college? Apart from those valuable discoveries in the physiology of the senses, a number of classifications and definitions of our mental processes which, thanks to linguistic usage, have become the common property of every educated person. That is clearly not enough to give a view of our mental life. Have you not noticed that every philosopher, every imaginative writer, every historian and every biographer makes up his own psychology for himself, brings forward his own particular hypotheses concerning the interconnections and aims of mental acts - all more or less plausible and all equally untrustworthy? There is an evident lack of any common foundation. And it is for that reason too that in the field of psychology there is, so to speak, no respect and no authority. In that field everyone can 'run wild' as he chooses. If you raise a question in physics or chemistry, anyone who knows he possesses no 'technical knowledge' will hold his tongue. But if you venture upon a psychological assertion, you must be prepared to meet judgements and contradictions from every quarter. In this field, apparently, there is no 'technical knowledge'. Everyone has a mental life, so everyone regards himself as a psychologist. But that strikes me as an inadequate legal title. The story is told of how someone who applied for a post as a children's nurse was asked if she knew how to look after babies. 'Of course,' she replied, 'why, after all, I was a baby once myself.'

'And you claim that you have discovered this "common foundation" of mental life, which has been overlooked by every psychologist, from observations on *sick people*?'

The source of our findings does not seem it me to deprive them of their value. Embryology, to take an example, would not deserve to be trusted if it could not give a plain explanation of the origin of innate malformations. I have told you of people whose thoughts go their own way, so that they are obliged to worry over problems to which they are perfectly indifferent. Do you think that academic psychology could ever make the smallest contribution towards explaining an abnormality such as that? And, after all, we all of us have the experience at night-time of our thoughts going their own way and creating things which we do not understand, which puzzle us, and which are suspiciously reminiscent of pathological products. Our dreams, I mean. The common people have always firmly believed that dreams have a sense and a value - that they mean something. Academic psychology has never been able to inform us what this meaning is. It could make nothing of dreams. If it attempted to produce explanations, they were non-psychological - such as tracing them to sensory stimuli, or to an unequal depth of sleep in different portions of the brain, and so on. But it is fair to say that a psychology which cannot explain dreams is also useless for an understanding of normal mental life, that it has no claim to be called a science.

'You are becoming aggressive; so you have evidently got on to a sensitive spot. I have heard, it is true, that in analysis great value is attached to dreams, that they are interpreted, and that memories of real events are looked for behind them, and so on. But I have heard as well that the interpretation of dreams is left to the caprice of analysts, and that they themselves have never ceased disputing over the way of interpreting dreams and the justification for drawing conclusions from them. If that is so, you ought not to underline so heavily the advantage that analysis has won over academic psychology.'

There is really a great deal of truth in what you say. It is true that the interpretation of dreams has come to have unequalled importance both for the theory and the practice of analysis. If I seem to be aggressive, that is only a way of defending myself. And when I think of all the mischief some analysts have done with the interpretation of dreams I might lose heart and echo the pessimistic pronouncement of our great satirist Nestroy when he says that every step forward is only half as big as it looks at first. But have you ever found that men do anything but confuse and distort what they get hold of? By the help of a little foresight and self-discipline most of the dangers of dream-interpretation can be avoided with certainty. But you will agree that I shall never come to my exposition if we let ourselves be led aside like this.

'Yes. If I understood rightly, you wanted to tell me about the fundamental postulate of the new psychology.'

That was not what I wanted to begin with. My purpose is to let you hear what pictures we have formed of the structure of the mental apparatus in the course of our analytic studies.

‘What do you mean by the "mental apparatus"? and what, may I ask, is it constructed of?’

It will soon be clear what the mental apparatus is; but I must beg you not to ask what material it is constructed of. That is not a subject of psychological interest. Psychology can be as indifferent to it as, for instance, optics can be to the question of whether the walls of a telescope are made of metal or cardboard. We shall leave entirely on one side the *material* line of approach, but not so the *spatial* one. For we picture the unknown apparatus which serves the activities of the mind as being really like an instrument constructed of several parts (which we speak of as ‘agencies’), each of which performs a particular function and which have a fixed spatial relation to one another: it being understood that by spatial relation - ‘in front of’ and ‘behind’, ‘superficial’ and ‘deep’- we merely mean in the first instance a representation of the regular succession of the functions. Have I made myself clear?

‘Scarcely. Perhaps I shall understand it later. But, in any case, here is a strange anatomy of the soul - a thing which, after all, no longer exists at all for the scientists.’

What do you expect? It is a hypothesis like so many others in the sciences: the very earliest ones have always been rather rough. ‘Open to revision’ we can say in such cases. It seems to me unnecessary for me to appeal here to the ‘as if’ which has become so popular. The value of a ‘fiction’ of this kind (as the philosopher Vaihinger would call it) depends on how much one can achieve with its help.

But to proceed. Putting ourselves on the footing of everyday knowledge, we recognize in human beings a mental organization which is interpolated between their sensory stimuli and the perception of their somatic needs on the one hand and their motor acts on the other, and which mediates between them for a particular purpose. We call this organization their '*Ich*'. Now there is nothing new in this. Each one of us makes this assumption without being a philosopher, and some people even in spite of being philosophers. But this does not, in our opinion, exhaust the description of the mental apparatus. Besides this '*I*', we recognize another mental region, more extensive, more imposing and more obscure than the '*I*', and this we call the '*Es*'. The relation between the two must be our immediate concern.

You will probably protest at our having chosen simple pronouns to describe our two agencies or provinces instead of giving them orotund Greek names. In psycho-analysis, however, we like to keep in contact with the popular mode of thinking and prefer to make its concepts scientifically serviceable rather than to reject them. There is no merit in this; we are obliged to take this line; for our theories must be understood by our patients, who are often very intelligent, but not always learned. The impersonal '*it*' is immediately connected with certain forms of expression used by normal people. '*It shot through me,*' people say; '*there was something in me at that moment that was stronger than me.*' '*C'était plus fort que moi.*'

In psychology we can only describe things by the help of analogies. There is nothing peculiar in this; it is the case elsewhere as well. But we have constantly to keep changing these analogies, for none of them lasts us long enough. Accordingly, in trying to make the relation between the ego and the id clear, I must ask you to picture the ego as a kind of façade of the id, as a frontage, like an external, cortical, layer of it. We can hold on to this last analogy. We know that cortical layers owe their peculiar characteristics to the modifying influence of the external medium on which they abut. Thus we suppose that the ego is the layer of the mental apparatus (of the id) which has been modified by the influence of the external world (of reality). This will show you how in psycho-analysis we take spatial ways of looking at things seriously. For us the ego is really something superficial and the id something deeper - looked at from outside, of course. The ego lies between reality and the id, which is what is truly mental.

'I will not ask any questions yet as to how all this can be known. But tell me first what you gain from this distinction between an ego and an id? What leads you to make it?'

Your question shows me the right way to proceed. For the important and valuable thing is to know that the ego and the id differ greatly from each other in several respects. The rules governing the course of mental acts are different in the ego and the id; the ego pursues different purposes and by other methods. A great deal could be said about this; but perhaps you will be content with a fresh analogy and an example. Think of the difference between 'the front' and 'behind the lines', as things were during the war. We were not surprised then that some things were different at the front from what they were behind the lines, and that many things were permitted behind the lines which had to be forbidden at the front. The determining influence was, of course, the proximity of the enemy; in the case of mental life it is the proximity of the external world. There was a time when 'outside', 'strange' and 'hostile' were identical concepts. And now we come to the example. In the id there are no conflicts; contradictions and antitheses persist side by side in it unconcernedly, and are often adjusted by the formation of compromises. In similar circumstances the ego feels a conflict which must be decided; and the decision lies in one urge being abandoned in favour of the other. The ego is an organization characterized by a very remarkable trend towards unification, towards synthesis. This characteristic is lacking in the id; it is, as we might say, 'all to pieces'; its different urges pursue their own purposes independently and regardless of one another.

'And if such an important mental region "behind the lines" exists, how can you explain its having been overlooked till the time of analysis?'

That brings us back to one of your earlier questions. Psychology had barred its own access to the region of the id by insisting on a postulate which is plausible enough but untenable: namely, that all mental acts are conscious to us - that being conscious is the criterion of what is mental, and that, if there are processes in our brain which are not conscious, they do not deserve to be called mental acts and are no concern of psychology.

‘But I should have thought that was obvious.’

Yes, and that is what psychologists think. Nevertheless it can easily be shown to be false - that is, to be a quite inexpedient distinction. The idlest self-observation shows that ideas may occur to us which cannot have come about without preparation. But you experience nothing of these preliminaries of your thought, though they too must certainly have been of a mental nature; all that enters your consciousness is the ready-made result. Occasionally you can make these preparatory thought-structures conscious *in retrospect*, as though in a reconstruction.

‘Probably one’s attention was distracted, so that one failed to notice the preparations.’

Evasions! You cannot in that way get around the fact that acts of a mental nature, and often very complicated ones, can take place in you, of which your consciousness learns nothing and of which you know nothing. Or are you prepared to suppose that a greater or smaller amount of your ‘attention’ is enough to transform a non-mental act into a mental one? But what is the use of disputing? There are hypnotic experiments in which the existence of such non-conscious thoughts are irrefutably demonstrated to anyone who cares to learn.

‘I shall not retract; but I believe I understand you at last. What you call "ego" is consciousness; and your "id" is the so-called subconscious that people talk about so much nowadays. But why the masquerading with the new names?’

It is not masquerading. The other names are of no use. And do not try to give me literature instead of science. If someone talks of subconsciousness, I cannot tell whether he means the term topographically - to indicate something lying in the mind beneath consciousness - or qualitatively - to indicate another consciousness, a subterranean one, as it were. He is probably not clear about any of it. The only trustworthy antithesis is between conscious and unconscious. But it would be a serious mistake to think that this antithesis coincides with the distinction between ego and id. Of course it would be delightful if it were as simple as that: our theory would have a smooth passage. But things are not so simple. All that is true is that everything that happens in the id is and remains unconscious, and that processes in the ego, and they alone, *can* become conscious. But not all of them are, nor always, nor necessarily; and large portions of the ego can remain permanently unconscious.

The becoming conscious of a mental process is a complicated affair. I cannot resist telling you - once again, dogmatically - our hypotheses about it. The ego, as you will remember, is the external, peripheral layer of the id. Now, we believe that on the outermost surface of this ego there is a special agency directed immediately to the external world, a system, an organ, through the excitation of which alone the phenomenon that we call consciousness comes about. This organ can be equally well excited from outside - thus receiving (with the help of the sense-organs) the stimuli from the external world - and from inside - thus becoming aware, first, of the sensations in the id, and then also of the processes in the ego.

'This is getting worse and worse and I can understand it less and less. After all, what you invited me to was a discussion of the question whether laymen (= non-doctors) ought to undertake analytic treatments. What is the point, then, of all these disquisitions on daring and obscure theories which you cannot convince me are justified?'

I know I cannot convince you. That is beyond any possibility and for that reason beyond my purpose. When we give our pupils theoretical instruction in psycho-analysis, we can see how little impression we are making on them to begin with. They take in the theories of analysis as coolly as other abstractions with which they are nourished. A few of them may perhaps *wish* to be convinced, but there is not a trace of their being so. But we also require that everyone who wants to practise analysis on other people shall first himself submit to an analysis. It is only in the course of this 'self-analysis' (as it is misleadingly termed), when they actually experience as affecting their own person - or rather, their own mind - the processes asserted by analysis, that they acquire the convictions by which they are later guided as analysts. How then could I expect to convince you, the Impartial Person, of the correctness of our theories, when I can only put before you an abbreviated and therefore unintelligible account of them, without confirming them from your own experiences?

I am acting with a different purpose. The question at issue between us is not in the least whether analysis is sensible or nonsensical, whether it is right in its hypotheses or has fallen into gross errors. I am unrolling our theories before you since that is the best way of making clear to you what the range of ideas is that analysis embraces, on the basis of what hypotheses it approaches a patient and what it does with him. In this way a quite definite light will be thrown on the question of lay analysis. And do not be alarmed. If you have followed me so far you have got over the worst. Everything that follows will be easier for you. - But now, with your leave, I will pause to take breath.

III

'I expect you will want to tell me how, on the basis of the theories of psycho-analysis, the origin of a neurotic illness can be pictured.'

I will try to. But for that purpose we must study our ego and our id from a fresh angle, from the *dynamic* one - that is to say, having regard to the forces at work in them and between them. Hitherto we have been content with a *description* of the mental apparatus.

'My only fear is that it may become unintelligible again!'

I hope not. You will soon find your way about in it. Well then, we assume that the forces which drive the mental apparatus into activity are produced in the bodily organs as an expression of the major somatic needs. You will recollect the words of our poet-philosopher: 'Hunger and love.' Incidentally, quite a formidable pair of forces! We give these bodily needs, in so far as they represent an instigation to mental activity, the name of '*Triebe*', a word for which we are envied by many modern languages. Well, these instincts fill the id: all the energy in the id, as we may put it briefly, originates from them. Nor have the forces in the ego any other origin; they are derived from those in the id. What, then, do these instincts want? Satisfaction - that is, the establishment of situations in which the bodily needs can be extinguished. A lowering of the tension of need is felt by our organ of consciousness as pleasurable; an increase of it is soon felt as unpleasure. From these oscillations arises the series of feelings of pleasure-unpleasure, in accordance with which the whole mental apparatus regulates its activity. In this connection we speak of a 'dominance of the pleasure principle'.

If the id's instinctual demands meet with no satisfaction, intolerable conditions arise. Experience soon shows that these situations of satisfaction can only be established with the help of the external world. At that point the portion of the id which is directed towards the external world - the ego - begins to function. If all the driving force that sets the vehicle in motion is derived from the id, the ego, as it were, undertakes the steering, without which no goal can be reached. The instincts in the id press for immediate satisfaction at all costs, and in that way they achieve nothing or even bring about appreciable damage. It is the task of the ego to guard against such mishaps, to mediate between the claims of the id and the objections of the external world. It carries on its activity in two directions. On the one hand, it observes the external world with the help of its sense-organ, the system of consciousness, so as to catch the favourable moment for harmless satisfaction; and on the other hand it influences the id, bridles its 'passions', induces its instincts to postpone their satisfaction, and indeed, if the necessity is recognized, to modify its aims, or, in return for some compensation, to give them up. In so far as it tames the id's impulses in this way, it replaces the pleasure principle, which was formerly alone decisive, by what is known as the 'reality principle', which, though it pursues the same ultimate aims, takes into account the conditions imposed by the real external world. Later, the ego learns that there is yet another way of securing satisfaction besides the *adaption* to the external world which I have described. It is also possible to intervene in the external world by *changing* it, and to establish in it intentionally the conditions which make satisfaction possible. This activity then becomes the ego's highest function; decisions as to when it is more expedient to control one's passions and bow before reality, and when it is more expedient to side with them and to take arms against the external world - such decisions make up the whole essence of worldly wisdom.

'And does the id put up with being dominated like this by the ego, in spite of being, if I understand you aright, the stronger party?'

Yes, all will be well if the ego is in possession of its whole organization and efficiency, if it has access to all parts of the id and can exercise its influence on them. For there is no natural opposition between ego and id; they belong together, and under healthy conditions cannot in practice be distinguished from each other.

‘That sounds very pretty; but I cannot see how in such an ideal relation there can be the smallest room for a pathological disturbance.’

You are right. So long as the ego and its relations to the id fulfil these ideal conditions, there will be no neurotic disturbance. The point at which the illness makes its breach is an unexpected one, though no one acquainted with general pathology will be surprised to find a confirmation of the principle that it is precisely the most important developments and differentiations that carry in them the seeds of illness, of failure of function.

‘You are becoming too learned. I cannot follow you.’

I must go back a little bit further. A small living organism is a truly miserable, powerless thing, is it not? compared with the immensely powerful external world, full as it is of destructive influences. A primitive organism, which has not developed any adequate ego-organization, is at the mercy of all these ‘traumas’. It lives by the ‘blind’ satisfaction of its instinctual wishes and often perishes in consequence. The differentiation of an ego is above all a step towards self-preservation. Nothing, it is true, can be learnt from being destroyed; but if one has luckily survived a trauma one takes notice of the approach of similar situations and signalizes the danger by an abbreviated repetition of the impressions one has experienced in connection with the trauma - by an *affect of anxiety*. This reaction to the perception of the danger now introduces an attempt at flight, which can have a life-saving effect till one has grown strong enough to meet the dangers of the external world in a more active fashion - even aggressively, perhaps.

‘All this is very far away from what you promised to tell me.’

You have no notion how close I am to fulfilling my promise. Even in organisms which later develop an efficient ego-organization, their ego is feeble and little differentiated from their id to begin with, during their first years of childhood. Imagine now what will happen if this powerless ego experiences an instinctual demand from the id which it would already like to resist (because it senses that to satisfy it is dangerous and would conjure up a traumatic situation, a collision with the external world) but which it cannot control, because it does not yet possess enough strength to do so. In such a case the ego treats the instinctual danger as if it was an external one; it makes an attempt at flight, draws back from this portion of the id and leaves it to its fate, after withholding from it all the contributions which it usually makes to instinctual impulses. The ego, as we put it, institutes a *repression* of these instinctual impulses. For the moment this has the effect of fending off the danger; but one cannot confuse the inside and the outside with impunity. One cannot run away from oneself. In repression the ego is following the pleasure principle, which it is usually in the habit of correcting; and it is bound to suffer damage in revenge. This lies in the ego's having permanently narrowed its sphere of influence. The repressed instinctual impulse is now isolated, left to itself, inaccessible, but also uninfluenceable. It goes its own way. Even later, as a rule, when the ego has grown stronger, it still cannot lift the repression; its synthesis is impaired, a part of the id remains forbidden ground to the ego. Nor does the isolated instinctual impulse remain idle; it understands how to make up for being denied normal satisfaction; it produces psychical derivatives which take its place; it links itself to other processes which by its influence it likewise tears away from the ego; and finally it breaks through into the ego and into consciousness in the form of an unrecognizably distorted substitute, and creates what we call a symptom. All at once the nature of a neurotic disorder becomes clear to us: on the one hand an ego which is inhibited in its synthesis, which has no influence on parts of the id, which must renounce some of its activities in order to avoid a fresh collision with what has been repressed, and which exhausts itself in what are for the most part vain acts of defence against the symptoms, the derivatives of the repressed impulses; and on the other hand an id in which individual instincts have made themselves independent, pursue their aims regardless of the interests of the person as a whole and henceforth obey the laws only of the primitive psychology that rules in the depths of the id. If we survey the whole situation we arrive at a simple formula for the origin of a neurosis: the ego has made an attempt to suppress certain portions of the id *in an inappropriate manner*, this attempt has failed and the id has taken its revenge. A neurosis is thus the result of a conflict between the ego and the id, upon which the ego has embarked because, as careful investigation shows, it wishes at all costs to retain its adaptability in relation to the real external world. The disagreement is between the external world and the id; and it is because the ego, loyal to its inmost nature, takes sides with the external world that it becomes involved in a conflict with its id. But please observe that what creates the determinant for the illness is not the fact of this conflict - for disagreements of this kind between reality and the id are unavoidable and it is one of the ego's standing tasks to mediate in them - but the circumstance that the ego has made use of the inefficient instrument of repression for dealing with the conflict. But this in turn is due to the fact that the ego, at the time at which it was set the task, was undeveloped and powerless. The decisive repressions all take place in early childhood.

‘What a remarkable business! I shall follow your advice and not make criticisms, since you only want to show me what psycho-analysis believes about the origin of neurosis so that you can go on to say how it sets about combating it. I should have various questions to ask and later on I shall raise some of them. But at the moment I myself feel tempted for once to carry your train of thought further and to venture upon a theory of my own. You have expounded the relation between external world, ego and id, and you have laid it down as the determinant of a neurosis that the ego in its dependence on the external world struggles against the id. Is not the opposite case conceivable of the ego in a conflict of this kind allowing itself to be dragged away by the id and disavowing its regard for the external world? What happens in a case like that? From my lay notions of the nature of insanity I should say that such a decision on the part of the ego might be the determinant of insanity. After all, a turning-away of that kind from reality seems to be the essence of insanity.’

Yes. I myself have thought of that possibility, and indeed I believe it meets the facts - though to prove the suspicion true would call for a discussion of some highly complicated considerations. Neuroses and psychoses are evidently intimately related, but they must nevertheless differ in some decisive respect. That might well be the side taken by the ego in a conflict of this kind. In both cases the id would retain its characteristic of blind inflexibility.

‘Well, go on! What hints on the treatment of neurotic illnesses does your theory give?’

It is easy now to describe our therapeutic aim. We try to restore the ego, to free it from its restrictions, and to give it back the command over the id which it has lost owing to its early repressions. It is for this one purpose that we carry out analysis, our whole technique is directed to this aim. We have to seek out the repressions which have been set up and to urge the ego to correct them with our help and to deal with conflicts better than by an attempt at flight. Since these repressions belong to the very early years of childhood, the work of analysis leads us, too, back to that period. Our path to these situations of conflict, which have for the most part been forgotten and which we try to revive in the patient’s memory, is pointed out to us by his symptoms, dreams and free associations. These must, however, first be interpreted - translated - for, under the influence of the psychology of the id, they have assumed forms of expression that are strange to our comprehension. We may assume that whatever associations, thoughts and memories the patient is unable to communicate to us without internal struggles are in some way connected with the repressed material or are its derivatives. By encouraging the patient to disregard his resistances to telling us these things, we are educating his ego to overcome its inclination towards attempts at flight and to tolerate an approach to what is repressed. In the end, if the situation of the repression can be successfully reproduced in his memory, his compliance will be brilliantly rewarded. The whole difference between his age then and now works in his favour; and the thing from which his childish ego fled in terror will often seem to his adult and strengthened ego no more than child’s play.

IV

'Everything you have told me so far has been psychology. It has often sounded strange, difficult, or obscure; but it has always been - if I may put it so - "pure". I have known very little hitherto, no doubt, about your psycho-analysis; but the rumour has nevertheless reached my ears that you are principally occupied with things that have no claim to that predicate. The fact that you have not yet touched on anything of the kind makes me feel that you are deliberately keeping something back. And there is another doubt that I cannot suppress. After all, as you yourself say, neuroses are disturbances of mental life. Is it possible, then, that such important things as our ethics, our conscience, our ideals, play no part at all in these profound disturbances?'

So you feel that a consideration both of what is lowest and of what is highest has been missing from our discussions up till now? The reason for that is that we have not yet considered the *contents* of mental life at all. But allow me now for once myself to play the part of an interrupter who holds up the progress of the conversation. I have talked so much psychology to you because I wanted you to get the impression that the work of analysis is a part of applied psychology - and, moreover, of a psychology that is unknown outside analysis. An analyst must therefore first and foremost have learnt this psychology, this depth-psychology or psychology of the unconscious, or as much of it at least as is known to-day. We shall need this as a basis for our later conclusions. But now, what was it you meant by your allusion to 'purity'?

'Well, it is generally reported that in analyses the most intimate - and the nastiest - events in sexual life come up for discussion in every detail. If that is so - I have not been able to gather from your psychological discussions that it is necessarily so - it would be a strong argument in favour of restricting these treatments to doctors. How could one dream of allowing such dangerous liberties to people of whose discretion one was not sure and of whose character one had no guarantee?'

It is true that doctors enjoy certain privileges in the sphere of sex: they are even allowed to inspect people's genitals - though they were not allowed to in the East and though some idealistic reformers (you know whom I have in mind) have disputed this privilege. But you want to know in the first place whether it is so in analysis and why it must be so. - Yes, it is so.

And it must be so, firstly, because analysis is entirely founded on complete candour. Financial circumstances, for instance, are discussed with equal detail and openness: things are said that are kept back from every fellow-citizen, even if he is not a competitor or a tax-collector. I will not dispute - indeed, I will myself insist with energy - that this obligation to candour puts a grave moral responsibility on the analyst as well. And it must be so, secondly, because factors from sexual life play an extremely important, a dominating, perhaps even a *specific* part among the causes and precipitating factors of neurotic illnesses. What else can analysis do but keep close to its subject-matter, to the material brought up by the patient? The analyst never entices his patient on to the ground of sex. He does not say to him in advance: 'We shall be dealing with the intimacies of your sexual life!' He allows him to begin what he has to say whenever he pleases, and quietly waits until the patient himself touches on sexual things. I used always to warn my pupils: 'Our opponents have told us that we shall come upon cases in which the factor of sex plays no part. Let us be careful not to introduce it into our analyses and so spoil our chance of finding such a case.' But so far none of us has had that good fortune.

I am aware, of course, that our recognition of sexuality has become - whether admittedly or not - the strongest motive for other people's hostility to analysis. Can that shake our confidence? It merely shows us how neurotic our whole civilized life is, since ostensibly normal people do not behave very differently from neurotics. At a time when psycho-analysis was solemnly put on its trial before the learned societies of Germany - to-day things have grown altogether quieter - one of the speakers claimed to possess peculiar authority because, so he said, he even allowed his patients to talk: for diagnostic purposes, clearly, and to test the assertions of analysts. 'But', he added, 'if they begin to talk about sexual matters I shut their mouths.' What do you think of that as a method of demonstration? The learned society applauded the speaker to the echo instead of feeling suitably ashamed on his account. Only the triumphant certainty afforded by the consciousness of prejudices held in common can explain this speaker's want of logical thought. Years later a few of those who had at that time been my followers gave in to the need to free human society from the yoke of sexuality which psycho-analysis was seeking to impose on it. One of them explained that what is sexual does not mean sexuality at all, but something else, something abstract and mystical. And another actually declared that sexual life is merely one of the spheres in which human beings seek to put in action their driving need for power and domination. They have met with much applause, for the moment at least.

'I shall venture, for once in a way, to take sides on that point. It strikes me as extremely bold to assert that sexuality is not a natural, primitive need of living organisms, but an expression of something else. One need only take the example of animals.'

That makes no difference. There is no mixture, however absurd, that society will not willingly swallow down if it is advertised as an antidote to the dreaded predominance of sexuality.

I confess, moreover, that the dislike that you yourself have betrayed of assigning to the factor of sexuality so great a part in the causation of neurosis - I confess that this scarcely seems to me consistent with your task as an Impartial Person. Are you not afraid that this antipathy may interfere with your passing a just judgement?

'I am sorry to hear you say that. Your reliance on me seems to be shaken. But in that case why not have chosen someone else as your Impartial Person?'

Because that someone else would not have thought any differently from you. But if he had been prepared from the first to recognize the importance of sexual life, everyone would have exclaimed: 'Why, that is no Impartial Person, he is one of your supporters!' No, I am far from abandoning the expectation of being able to influence your opinions. I must admit, however, that from my point of view this situation is different from the one we dealt with earlier. As regards our psychological discussions it is a matter of indifference to me whether you believe me or not, provided only that you get an impression that what we are concerned with are purely psychological problems. But here, as regards the question of sexuality, I should nevertheless be glad if you were accessible to the realization that your strongest motive for contradiction is precisely the ingrained hostility which you share with so many other people.

‘But after all I am without the experience that has given you your unshakeable certainty.’

Very well. I can now proceed with my exposition. Sexual life is not simply something spicy; it is also a serious scientific problem. There was much that was novel to be learnt about it, many strange things to be explained. I told you just now that analysis has to go back into the early years of the patient’s childhood, because the decisive repressions have taken place then, while his ego was feeble. But surely in childhood there is no sexual life? surely it only starts at puberty? On the contrary. We have to learn that sexual instinctual impulses accompany life from birth onwards, and that it is precisely in order to fend off those instincts that the infantile ego institutes repressions. A remarkable coincidence, is it not? that small children should already be struggling against the power of sexuality, just as the speaker in the learned society was to do later, and later still my followers who have set up their own theories. How does that come about? The most general explanation would be that our civilization is built up entirely at the expense of sexuality; but there is much more to be said on the subject.

The discovery of infantile sexuality is one of those of which we have reason to feel ashamed. A few paediatricians have, it seems, always known about it, and a few children’s nurses. Clever men, who call themselves child psychologists, have thereupon spoken in tones of reproach of a ‘desecration of the innocence of childhood’. Once again, sentiment instead of argument! Events of that kind are of daily occurrence in political bodies. A member of the Opposition rises and denounces some piece of maladministration in the Civil Service, in the Army, in the Judiciary and so on. Upon this another member, preferably one of the Government, declares that such statements are an affront to the sense of honour of the body politic, of the army, of the dynasty, or even of the nation. So they are as good as untrue. Feelings such as these can tolerate no affronts.

The sexual life of children is of course different from that of adults. The sexual function, from its beginnings to the definitive form in which it is so familiar to us, undergoes a complicated process of development. It grows together from numerous component instincts with different aims and passes through several phases of organization till at last it comes into the service of reproduction. Not all the component instincts are equally serviceable for the final outcome; they must be diverted, remodelled and in part suppressed. Such a far-reaching course of development is not always passed through without a flaw; inhibitions in development take place, partial fixations at early stages of development. If obstacles arise later on to the exercise of the sexual function, the sexual urge - the libido, as we call it - is apt to hark back to these earlier points of fixation. The study of the sexuality of children and its transformations up to maturity has also given us the key to an understanding of what are known as the sexual perversions, which people used always to describe with all the requisite indications of disgust but whose origin they were never able to explain. The whole topic is of uncommon interest, but for the purposes of our conversation there is not much sense in telling you more about it. To find one's way about in it one of course needs anatomical and physiological knowledge, all of which is unfortunately not to be acquired in medical schools. But a familiarity with the history of civilization and with mythology is equally indispensable.

'After all that, I still cannot form any picture of the sexual life of children.'

Then I will pursue the subject further; in any case it is not easy for me to get away from it. I will tell you, then, that the most remarkable thing about the sexual life of children seems to me that it passes through the whole of its very far-reaching development in the first five years of life. From then onwards until puberty there stretches what is known as the period of latency. During it sexuality normally advances no further; on the contrary, the sexual urges diminish in strength and many things are given up and forgotten which the child did and knew. During that period of life, after the early efflorescence of sexuality has withered, such attitudes of the ego as shame, disgust and morality arise, which are destined to stand up against the later tempest of puberty and to lay down the path of the freshly awakening sexual desires. This 'diphasic onset', as it is named, of sexual life has a great deal to do with the genesis of neurotic illnesses. It seems to occur only in human beings, and it is perhaps one of the determinants of the human privilege of becoming neurotic. The prehistory of sexual life was just as much overlooked before psycho-analysis as, in another department, the background to conscious mental life. You will rightly suspect that the two are intimately connected.

There is much to be told, for which our expectations have not prepared us, about the contents, manifestations and achievements of this early period of sexuality. For instance, you will no doubt be surprised to hear how often little boys are afraid of being eaten up by their father. (And you may also be surprised at my including this fear among the phenomena of sexual life.) But I may remind you of the mythological tale which you may still recall from your schooldays of how the god Kronos swallowed his children. How strange this must have sounded to you when you first heard it! But I suppose none of us thought about it at the time. To-day we can also call to mind a number of fairy tales in which some ravenous animal like a wolf appears, and we shall recognize it as a disguise of the father. And this is an opportunity of assuring you that it was only through the knowledge of infantile sexuality that it became possible to understand mythology and the world of fairy tales. Here then something has been gained as a by-product of analytic studies.

You will be no less surprised to hear that male children suffer from a fear of being robbed of their sexual organ by their father, so that this fear of being castrated has a most powerful influence on the development of their character and in deciding the direction to be followed by their sexuality. And here again mythology may give you the courage to believe psycho-analysis. The same Kronos who swallowed his children also emasculated his father Uranus, and was afterwards himself emasculated in revenge by his son Zeus, who had been rescued though his mother's cunning. If you have felt inclined to suppose that all that psycho-analysis reports about the early sexuality of children is derived from the disordered imagination of the analysts, you must at least admit that their imagination has created the same product as the imaginative activities of primitive man, of which myths and fairy tales are the precipitate. The alternative friendlier, and probably also the more pertinent view would be that in the mental life of children to-day we can still detect the same archaic factors which were once dominant generally in the primaeval days of human civilization. In his mental development the child would be repeating the history of his race in an abbreviated form, just as embryology long since recognized was the case with somatic development.

Another characteristic of early infantile sexuality is that the female sexual organ proper as yet plays no part in it: the child has not yet discovered it. Stress falls entirely on the male organ, all the child's interest is directed towards the question of whether it is present or not. We know less about the sexual life of little girls than of boys. But we need not feel ashamed of this distinction; after all, the sexual life of adult women is a 'dark continent' for psychology. But we have learnt that girls feel deeply their lack of a sexual organ that is equal in value to the male one; they regard themselves on that account as inferior, and this 'envy for the penis' is the origin of a whole number of characteristic feminine reactions.

It is also characteristic of children that their two excretory needs are cathected with sexual interest. Later on, education draws a sharp distinction here, which is once more obliterated in the practice of joking. It may seem to us an unsavoury fact, but it takes quite a long time for children to develop feelings of disgust. This is not disputed even by people who insist otherwise on the seraphic purity of the child's mind.

Nothing, however, deserves more notice than the fact that children regularly direct their sexual wishes towards their nearest relatives - in the first place, therefore, towards their father and mother, and afterwards towards their brothers and sisters. The first object of a boy's love is his mother, and of a girl's her father (except in so far as an innate bisexual disposition favours the simultaneous presence of the contrary attitude). The other parent is felt as a disturbing rival and not infrequently viewed with strong hostility. You must understand me aright. What I mean to say is not that the child wants to be treated by its favourite parent merely with the kind of affection which we adults like to regard as the essence of the parent-child relation. No, analysis leaves us in no doubt that the child's wishes extend beyond such affection to all that we understand by sensual satisfaction - so far, that is, as the child's powers of imagination allow. It is easy to see that the child never guesses the actual facts of sexual intercourse; he replaces them by other notions derived from his own experience and feelings. As a rule his wishes culminate in the intention to bear, or in some in definable way, to procreate a baby. Boys, too, in their ignorance, do not exclude themselves from the wish to bear a baby. We give the whole of this mental structure the name of 'Oedipus complex', after the familiar Greek legend. With the end of the early sexual period it should normally be given up, should radically disintegrate and become transformed; and the results of this transformation are destined for important functions in later mental life. But as a rule this is not effected radically enough, in which case puberty brings about a revival of the complex, which may have serious consequences.

I am surprised that you are still silent. That can scarcely mean consent. - In asserting that a child's first choice of an object is, to use the technical term, an incestuous one, analysis no doubt once more hurt the most sacred feelings of humanity, and might well be prepared for a corresponding amount of disbelief, contradiction and attack. And these it has received in abundance. Nothing has damaged it more in the good opinion of its contemporaries than its hypothesis of the Oedipus complex as a structure universally bound to human destiny. The Greek myth, incidentally, must have had the same meaning; but the majority of men to-day, learned and unlearned alike, prefer to believe that Nature has laid down an innate abhorrence in us as a guard against the possibility of incest.

But let us first summon history to our aid. When Caius Julius Caesar landed in Egypt, he found the young Queen Cleopatra (who was soon to become so important to him) married to her still younger brother Ptolemy. In an Egyptian dynasty there was nothing peculiar in this; the Ptolemies, who were of Greek origin, had merely carried on the custom which had been practised by their predecessors, the ancient Pharaohs, for a few thousand years. This, however, was merely brother-and-sister incest, which even at the present time is not judged so harshly. So let us turn to our chief witness in matters concerning *primaeva* times - mythology. It informs us that the myths of every people, and not only of the Greeks, are filled with examples of love-affairs between fathers and daughters and even between mothers and sons. Cosmology, no less than the genealogy of royal races, is founded upon incest. For what purpose do you suppose these legends were created? To brand gods and kings as criminals? to fasten on them the abhorrence of the human race? Rather, surely, because incestuous wishes are a primordial human heritage and have never been fully overcome, so that their fulfilment was still granted to gods and their descendants when the majority of common humans were already obliged to renounce them. It is in complete harmony with these lessons of history and mythology that we find incestuous wishes still present and operative in the childhood of the individual.

'I might take it amiss that you tried to keep back all this about infantile sexuality from me. It seems to me most interesting, particularly on account of its connection with human prehistory.'

I was afraid it might take us too far from our purpose. But perhaps after all it will be of use.

'Now tell me, though, what certainty can you offer for your analytic findings on the sexual life of children? Is your conviction based solely on points of agreement with mythology and history?'

Oh, by no means. It is based on direct observation. What happened was this. We had begun by inferring the content of sexual childhood from the analysis of adults - that is to say, some twenty to forty years later. Afterwards, we undertook analyses on children themselves, and it was no small triumph when we were thus able to confirm in them everything that we had been able to divine, in spite of the amount to which it had been overlaid and distorted in the interval.

'What? You have had small children in analysis? children of less than six years? *Can* that be done? And is it not most risky for the children?'

It can be done very well. It is hardly to be believed what goes on in a child of four or five years old. Children are very active-minded at that age; their early sexual period is also a period of intellectual flowering. I have an impression that with the onset of the latency period they become mentally inhibited as well, stupider. From that time on, too, many children lose their physical charm. And, as regards the damage done by early analysis, I may inform you that the first child on whom the experiment was ventured, nearly twenty years ago, has since then grown into a healthy and capable young man, who has passed through his puberty irreproachably, in spite of some severe psychical traumas. It may be hoped that things will turn out no worse for the other 'victims' of early analysis. Much that is of interest attaches to these child analyses; it is possible that in the future they will become still more important. From the point of view of theory, their value is beyond question. They give unambiguous information on problems which remain unsolved in the analyses of adults; and they thus protect the analyst from errors that might have momentous consequences for him. One surprises the factors that lead to the formation of a neurosis while they are actually at work and one cannot then mistake them. In the child's interest, it is true, analytic influence must be combined with educational measures. The technique has still to receive its shaping. But practical interest is aroused by the observation that a very large number of our children pass through a plainly neurotic phase in the course of their development. Since we have learnt how to look more sharply, we are tempted to say that neurosis in children is not the exception but the rule, as though it could scarcely be avoided on the path from the innate disposition of infancy to civilized society. In most cases this neurotic phase in childhood is overcome spontaneously. But may it not also regularly leave its traces in the average healthy adult? On the other hand in those who are neurotics in later life we never fail to find links with the illness in childhood, though at the time it need not have been very noticeable. In a precisely analogous way physicians to-day, I believe, hold the view that each one of us has gone through an attack of tuberculosis in his childhood. It is true that in the case of the neuroses the factor of immunization does not operate, but only the factor of predisposition.

Let me return to your question about certainty. We have become quite generally convinced from the direct analytic examination of children that we were right in our interpretation of what adults told us about their childhood. In a number of cases, however, another sort of confirmation has become possible. The material of the analysis of some patients has enabled us to reconstruct certain external happenings, certain impressive events of their childhood years, of which they have preserved no conscious memory. Lucky accidents, information from parents or nurses, have afterwards provided irrefutable evidence that these occurrences which we had inferred really did take place. This, of course, has not happened often, but when it has it has made an overwhelming impression. The correct reconstruction, you must know, of such forgotten experiences of childhood always has a great therapeutic effect, whether they permit of objective confirmation or not. These events owe their importance, of course, to their having occurred at such an early age, at a time when they could still produce a traumatic effect on the feeble ego.

‘And what sort of events can these be, that have to be discovered by analysis?’

Various sorts. In the first place, impressions capable of permanently influencing the child’s budding sexual life - such as observations of sexual activities between adults, or sexual experiences of his own with an adult or another child (no rare events); or, again, overhearing conversations, understood either at the time or retrospectively, from which the child thought it could draw conclusions about mysterious or uncanny matters; or again, remarks or actions by the child himself which give evidence of significant attitudes of affection or enmity towards other people. It is of special importance in an analysis to induce a memory of the patient’s own forgotten sexual activity as a child and also of the intervention by the adults which brought it to an end.

‘That gives me an opportunity of bringing up a question that I have long wanted to ask. What, then, is the nature of this "sexual activity" of children at an early age, which, as you say, was overlooked before the days of analysis?’

It is an odd thing that the regular and essential part of this sexual activity was *not* overlooked. Or rather, it is by no means odd; for it was impossible to overlook it. Children's sexual impulses find their main expressions in self-gratification by friction of their own genitals, or, more precisely, of the male portion of them. The extraordinarily wide distribution of this form of childish 'naughtiness' was always known to adults, and it was regarded as a grave sin and severely punished. But please do not ask me how people could reconcile these observations of the immoral inclinations of children - for children do it, as they themselves say, because it gives them pleasure - with the theory of their innate purity and non-sensuality. You must get our opponents to solve this riddle. We have a more important problem before us. What attitude should we adopt towards the sexual activity of early childhood? We know the responsibility we are incurring if we suppress it; but we do not venture to let it take its course without restriction. Among races at a low level of civilization, and among the lower strata of civilized races, the sexuality of children seems to be given free rein. This probably provides a powerful protection against the subsequent development of neuroses in the individual. But does it not at the same time involve an extraordinary loss of the aptitude for cultural achievements? There is a good deal to suggest that here we are faced by a new Scylla and Charybdis.

But whether the interests which are stimulated by the study of the sexual life of neurotics create an atmosphere favourable to the encouragement of lasciviousness - *that* is a question which I venture to leave to your own judgement.

V

'I believe I understand your purpose. You want to show me what kind of knowledge is needed in order to practise analysis, so that I may be able to judge whether only doctors should have a right to do so. Well, so far very little to do with medicine has turned up: a great deal of psychology and a little biology or sexual science. But perhaps we have not got to the end?'

Decidedly not. There are still gaps to be filled. May I make a request? Will you describe how you now picture an analytic treatment? - just as though you had to undertake one yourself.

'A fine idea, to be sure! No, I have not the least intention of settling our controversy by an experiment of that sort. But just to oblige, I will do what you ask - the responsibility will be yours. Very well. I will suppose that the patient comes to me and complains of his troubles. I promise him recovery or improvement if he will follow my directions. I call on him to tell me with perfect candour everything that he knows and that occurs to him, and not to be deterred from that intention even if some things are disagreeable to say. Have I taken in the rule properly?'

Yes. You should add: 'even if what occurs to him seems unimportant or senseless.'

'I will add that. Thereupon he begins to talk and I listen. And what then? I infer from what he tells me the kind of impressions, experiences and wishes which he has repressed because he came across them at a time when his ego was still feeble and was afraid of them instead of dealing with them. When he has learnt this from me, he puts himself back in the old situations and with my help he manages better. The limitations to which his ego was tied then disappear, and he is cured. Is that right?'

Bravo! bravo! I see that once again people will be able to accuse me of having made an analyst of someone who is not a doctor. You have mastered it all admirably.

'I have done no more than repeat what I have heard from you - as though it was something I had learnt by heart. All the same, I cannot form any picture of how I should do it, and I am quite at a loss to understand why a job like that should take an hour a day for so many months. After all, an ordinary person has not as a rule experienced such a lot, and what was repressed in childhood is probably in every case the same.'

When one really practises analysis one learns all kinds of things besides. For instance: you would not find it at all such a simple matter to deduce from what the patient tells you the experiences he has forgotten and the instinctual impulses he has repressed. He says something to you which at first means as little to you as it does to him. You will have to make up your mind to look at the material which he delivers to you in obedience to the rule in a quite special way: as though it were ore, perhaps, from which its content of precious metal has to be extracted by a particular process. You will be prepared, too, to work over many tons of ore which may contain but little of the valuable material you are in search of. Here we should have a first reason for the prolonged character of the treatment.

‘But how does one work over this raw material - to keep to your simile?’

By assuming that the patient’s remarks and associations are only distortions of what you are looking for - allusions, as it were, from which you have to guess what is hidden behind them. In a word, this material, whether it consists of memories, associations or dreams, has first to be *interpreted*. You will do this, of course, with an eye to the expectations you have formed as you listened, thanks to your special knowledge.

“Interpret!” A nasty word! I dislike the sound of it; it robs me of all certainty. If everything depends on my interpretation who can guarantee that I interpret right? So after all everything *is* left to my caprice.’

Just a moment! Things are not quite as bad as that. Why do you choose to except your own mental processes from the rule of law which you recognize in other people's? When you have attained some degree of self-discipline and have certain knowledge at your disposal, your interpretations will be independent of your personal characteristics and will hit the mark. I am not saying that the analyst's personality is a matter of indifference for this portion of his task. A kind of sharpness of hearing for what is unconscious and repressed, which is not possessed equally by everyone, has a part to play. And here, above all, we are brought to the analyst's obligation to make himself capable, by a deep-going analysis of his own, of the unprejudiced reception of the analytic material. Something, it is true, still remains over: something comparable to the 'personal equation' in astronomical observations. This individual factor will always play a larger part in psycho-analysis than elsewhere. An abnormal person can become an accurate physicist; as an analyst he will be hampered by his own abnormality from seeing the pictures of mental life undistorted. Since it is impossible to demonstrate to anyone his own abnormality, general agreement in matters of depth-psychology will be particularly hard to reach. Some psychologists, indeed, think it is quite impossible and that every fool has an equal right to give out his folly as wisdom. I confess that I am more of an optimist about this. After all, our experiences show that fairly satisfactory agreements can be reached even in psychology. Every field of research has its particular difficulty which we must try to eliminate. And, moreover, even in the interpretative art of analysis there is much that can be learnt like any other material of study: for instance, in connection with the peculiar method of indirect representation through symbols.

'Well, I no longer have any desire to undertake an analytic treatment even in my imagination. Who can say what other surprises I might meet with?'

You are quite right to give up the notion. You see how much more training and practice would be needed. When you have found the right interpretation, another task lies ahead. You must wait for the right moment at which you can communicate your interpretation to the patient with some prospect of success.

'How can one always tell the right moment?'

That is a question of tact, which can become more refined with experience. You will be making a bad mistake if, in an effort, perhaps, at shortening the analysis, you throw your interpretations at the patient's head as soon as you have found them. In that way you will draw expressions of resistance, rejection and indignation from him; but you will not enable his ego to master his repressed material. The formula is: to wait till he has come so near to the repressed material that he has only a few more steps to take under the lead of the interpretation you propose.

'I believe I should never learn to do that. And if I carry out these precautions in making my interpretation, what next?'

It will then be your fate to make a discovery for which you were not prepared.

'And what may that be?'

That you have been deceived in your patient; that you cannot count in the slightest on his collaboration and compliance; that he is ready to place every possible difficulty in the way of your common work - in a word, that he has no wish whatever to be cured.

'Well! that is the craziest thing you have told me yet. And I do not believe it either. The patient who is suffering so much, who complains so movingly about his troubles, who is making so great a sacrifice for the treatment - you say he has no wish to be cured! But of course you do not mean what you say.'

Calm yourself! I *do* mean it. What I said was the truth - not the whole truth, no doubt, but a very noteworthy part of it. The patient wants to be cured - but he also wants not to be. His ego has lost its unity, and for that reason his will has no unity either. If that were not so, he would be no neurotic.

"Were I sagacious, I should not be Tell!"

The derivatives of what is repressed have broken into his ego and established themselves there; and the ego has as little control over trends from that source as it has over what is actually repressed, and as a rule it knows nothing about them. These patients, indeed, are of a peculiar nature and raise difficulties with which we are not accustomed to reckon. All our social institutions are framed for people with a united and normal ego, which one can classify as good or bad, which either fulfils its function or is altogether eliminated by an overpowering influence. Hence the juridical alternative: responsible or irresponsible. None of these distinctions apply to neurotics. It must be admitted that there is difficulty in adapting social demands to their psychological condition. This was experienced on a large scale during the last war. Were the neurotics who evaded service malingerers or not? They were both. If they were treated as malingerers and if their illness was made highly uncomfortable, they recovered; if after being ostensibly restored they were sent back into service, they promptly took flight once more into illness. Nothing could be done with them. And the same is true of neurotics in civil life. They complain of their illness but exploit it with all their strength; and if someone tries to take it away from them they defend it like the proverbial lioness with her young. Yet there would be no sense in reproaching them for this contradiction.

‘But would not the best plan be not to give these difficult people any treatment at all, but to leave them to themselves! I cannot think it is worth while to expend such great efforts over each of them as you lead me to suppose that you make.’

I cannot approve of your suggestion. It is undoubtedly a more proper line to accept the complications of life rather than struggle against them. It may be true that not every neurotic whom we treat is worth the expenditure of an analysis; but there are some very valuable individuals among them as well. We must set ourselves the goal of bringing it about that as few human beings as possible enter civilized life with such a defective mental equipment. And for that purpose we must collect much experience and learn to understand many things. Every analysis can be instructive and bring us a yield of new understanding quite apart from the personal value of the individual patient.

‘But if a volitional impulse has been formed in the patient’s ego which wishes to retain the illness, it too must have its reasons and motives and be able in some way to justify itself. But it is impossible to see why anyone should want to be ill or what he can get out of it.’

Oh, that is not so hard to understand. Think of the war neurotics, who do not have to serve, precisely because they are ill. In civil life illness can be used as a screen to gloss over incompetence in one’s profession or in competition with other people; while in the family it can serve as a means for sacrificing the other members and extorting proofs of their love or for imposing one’s will upon them. All of this lies fairly near the surface; we sum it up in the term ‘gain from illness’. It is curious, however, that the patient - that is, his ego - nevertheless knows nothing of the whole concatenation of these motives and the actions which they involve. One combats the influence of these trends by compelling the ego to take cognizance of them. But there are other motives, that lie still deeper, for holding on to being ill, which are not so easily dealt with. But these cannot be understood without a fresh journey into psychological theory.

‘Please go on. A little more theory will make no odds now.’

When I described the relation between the ego and the id to you, I suppressed an important part of the theory of the mental apparatus. For we have been obliged to assume that within the ego itself a particular agency has become differentiated, which we name the super-ego. This super-ego occupies a special position between the ego and the id. It belongs to the ego and shares its high degree of psychological organization; but it has a particularly intimate connection with the id. It is in fact a precipitate of the first object-cathexes of the id and is the heir to the Oedipus complex after its demise. This super-ego can confront the ego and treat it like an object; and it often treats it very harshly. It is as important for the ego to remain on good terms with the super-ego as with the id. Estrangements between the ego and the super-ego are of great significance in mental life. You will already have guessed that the super-ego is the vehicle of the phenomenon that we call conscience. Mental health very much depends on the super-ego’s being normally developed - that is, on its having become sufficiently impersonal. And that is precisely what it is not in neurotics, whose Oedipus complex has not passed through the correct process of transformation. Their super-ego still confronts their ego as a strict father confronts a child; and their morality operates in a primitive fashion in that the ego gets itself punished by the super-ego. Illness is employed as an instrument for this ‘self-punishment’, and neurotics have to behave as though they were governed by a sense of guilt which, in order to be satisfied, needs to be punished by illness.

‘That really sounds most mysterious. The strangest thing about it is that apparently even this mighty force of the patient’s conscience does not reach his consciousness.’

Yes, we are only beginning to appreciate the significance of all these important circumstances. That is why my description was bound to turn out so obscure. But now I can proceed. We describe all the forces that oppose the work of recovery as the patient's 'resistances'. The gain from illness is one such resistance. The 'unconscious sense of guilt' represents the super-ego's resistance; it is the most powerful factor, and the one most dreaded by us. We meet with still other resistances during the treatment. If the ego during the early period has set up a repression out of fear, then the fear still persists and manifests itself as a resistance if the ego approaches the repressed material. And finally, as you can imagine, there are likely to be difficulties if an instinctual process which has been going along a particular path for whole decades is suddenly expected to take a new path that has just been made open for it. That might be called the id's resistance. The struggle against all these resistances is our main work during an analytic treatment; the task of making interpretations is nothing compared to it. But as a result of this struggle and of the overcoming of the resistances, the patient's ego is so much altered and strengthened that we can look forward calmly to his future behaviour when the treatment is over. On the other hand, you can understand now why we need such long treatments. The length of the path of development and the wealth of the material are not the decisive factors. It is more a question of whether the path is clear. An army can be held up for weeks on a stretch of country which in peace time an express train crosses in a couple of hours - if the army has to overcome the enemy's resistance there. Such battles call for time in mental life too. I am unfortunately obliged to tell you that every effort to hasten analytic treatment appreciably has hitherto failed. The best way of shortening it seems to be to carry it out according to the rules.

'If I ever felt any desire to poach on your preserves and try my hand at analysing someone else, what you tell me about the resistances would have cured me of it. But how about the special personal influence that you yourself have after all admitted? Does not that come into action against the resistances?'

It is a good thing you have asked me about that. This personal influence is our most powerful dynamic weapon. It is the new element which we introduce into the situation and by means of which we make it fluid. The intellectual content of our explanations cannot do it, for the patient, who shares all the prejudices of the world around him, need believe us as little as our scientific critics do. The neurotic sets to work because he has faith in the analyst, and he believes him because he acquires a special emotional attitude towards the figure of the analyst. Children, too, only believe people they are attached to. I have already told you what use we make of this particularly large 'suggestive' influence. Not for suppressing the symptoms - this distinguishes the analytic method from other psychotherapeutic procedures - but as a motive force to induce the patient to overcome his resistances.

'Well, and if that succeeds, does not everything then go smoothly?'

Yes, it ought to. But there turns out to be an unexpected complication. It was perhaps the greatest of the analyst's surprises to find that the emotional relation which the patient adopts towards him is of a quite peculiar nature. The very first doctor who attempted an analysis - it was not myself - came up against this phenomenon and did not know what to make of it. For this emotional relation is, to put it plainly, in the nature of falling in love. Strange, is it not? Especially when you take into account that the analyst does nothing to provoke it but on the contrary rather keeps at a distance from the patient, speaking humanly, and surrounds himself with some degree of reserve - when you learn besides that this odd love-relationship disregards anything else that is really propitious and every variation in personal attraction, age, sex or class. This love is of a positively compulsive kind. Not that that characteristic need be absent from spontaneous falling in love. As you know, the contrary is often the case. But in the analytic situation it makes its appearance with complete regularity without there being any rational explanation for it. One would have thought that the patient's relation to the analyst called for no more than a certain amount of respect, trust, gratitude and human sympathy. Instead, there is this falling in love, which itself gives the impression of being a pathological phenomenon.

'I should have thought all the same that it would be favourable for your analytic purposes. If someone is in love, he is amenable, and he will do anything in the world for the sake of the other person.'

Yes. It *is* favourable to start with. But when this falling in love has grown deeper, its whole nature comes to light, much of which is incompatible with the task of analysis. The patient's love is not satisfied with being obedient; it grows exacting, calls for affectionate and sensual satisfactions, it demands exclusiveness, it develops jealousy, and it shows more and more clearly its reverse side, its readiness to become hostile and revengeful if it cannot obtain its ends. At the same time, like all falling in love, it drives away all other mental material; it extinguishes interest in the treatment and in recovery - in short, there can be no doubt that it has taken the place of the neurosis and that our work has had the result of driving out one form of illness with another.

'That does sound hopeless! What can be done about it? The analysis would have to be given up. But if, as you say, the same thing happens in every case, it would be impossible to carry through any analyses at all.'

We will begin by using the situation in order to learn something from it. What we learn may then perhaps help us to master it. Is it not an extremely noteworthy fact that we succeed in transforming every neurosis, whatever its content, into a condition of pathological love?

Our conviction that a portion of erotic life that has been abnormally employed lies at the basis of neuroses must be unshakeably strengthened by this experience. With this discovery we are once more on a firm footing and can venture to make this love itself the object of analysis. And we can make another observation. Analytic love is not manifested in every case as clearly and blatantly as I have tried to depict it. Why not? We can soon see. In proportion as the purely sensual and the hostile sides of his love try to show themselves, the patient's opposition to them is aroused. He struggles against them and tries to repress them before our very eyes. And now we understand what is happening. The patient is *repeating* in the form of falling in love with the analyst mental experiences which he has already been through once before; he has *transferred* on to the analyst mental attitudes that were lying ready in him and were intimately connected with his neurosis. He is also repeating before our eyes his old defensive actions; he would like best to repeat in his relation to the analyst *all* the history of that forgotten period of his life. So what he is showing us is the kernel of his intimate life history: *he is reproducing it tangibly, as though it were actually happening, instead of remembering it*. In this way the riddle of the transference-love is solved and the analysis can proceed on its way - with the *help* of the new situation which had seemed such a menace to it.

'That is very cunning. And is the patient so easy to convince that he is not in love but only obliged to stage a revival of an old piece!'

Everything now depends on that. And the whole skill in handling the 'transference' is devoted to bringing it about. As you see, the requirements of analytic technique reach their maximum at this point. Here the gravest mistakes can be made or the greatest successes be registered. It would be folly to attempt to evade the difficulties by suppressing or neglecting the transference; whatever else had been done in the treatment, it would not deserve the name of an analysis. To send the patient away as soon as the inconveniences of his transference neurosis make their appearance would be no more sensible, and would moreover be cowardly. It would be as though one had conjured up spirits and run away from them as soon as they appeared. Sometimes, it is true, nothing else is possible. There are cases in which one cannot master the unleashed transference and the analysis has to be broken off; but one must at least have struggled with the evil spirits to the best of one's strength. To yield to the demands of the transference, to fulfil the patient's wishes for affectionate and sensual satisfaction, is not only justly forbidden by moral considerations but is also completely ineffective as a technical method for attaining the purpose of the analysis. A neurotic cannot be cured by being enabled to reproduce uncorrected an unconscious stereotype plate that is ready to hand in him. If one engages in compromises with him by offering him partial satisfactions in exchange for his further collaboration in the analysis, one must beware of falling into the ridiculous situation of the cleric who was supposed to convert a sick insurance agent. The sick man remained unconverted but the cleric took his leave insured. The only possible way out of the transference situation is to trace it back to the patient's past, as he really experienced it or as he pictured it through the wish-fulfilling activity of his imagination. And this demands from the analyst much skill, patience, calm and self-abnegation.

'And where do you suppose the neurotic experienced the prototype of his transference-love?'

In his childhood: as a rule in his relation with one of his parents. You will remember what importance we had to attribute to these earliest emotional ties. So here the circle closes.

‘Have you finished at last? I am feeling just a little bewildered with all I have heard from you. Only tell me one thing more: how and where can one learn what is necessary for practising analysis?’

There are at the moment two Institutes at which instruction in psycho-analysis is given. The first has been founded in Berlin by Dr. Max Eitingon, who is a member of the Society there. The second is maintained by the Vienna Psycho-Analytical Society at its own expense and at considerable sacrifice. The part played by the authorities is at present limited to the many difficulties which they put in the way of the young undertaking. A third training Institute is at this moment being opened in London by the Society there, under the direction of Dr. Ernest Jones. At these Institutes the candidates themselves are taken into analysis, receive theoretical instruction by lectures on all the subjects that are important for them, and enjoy the supervision of older and more experienced analysts when they are allowed to make their first trials with comparatively slight cases. A period of some two years is calculated for this training. Even after this period, of course, the candidate is only a beginner and not yet a master. What is still needed must be acquired by practice and by an exchange of ideas in the psycho-analytical societies in which young and old members meet together. Preparation for analytic activity is by no means so easy and simple. The work is hard, the responsibility great. But anyone who has passed through such a course of instruction, who has been analysed himself, who has mastered what can be taught to-day of the psychology of the unconscious, who is at home in the science of sexual life, who has learnt the delicate technique of psycho-analysis, the art of interpretation, of fighting resistances and of handling the transference - anyone who has accomplished all this *is no longer a layman in the field of psycho-analysis*. He is capable of undertaking the treatment of neurotic disorders, and will be able in time to achieve in that field whatever can be required from this form of therapy.

VI

'You have expended a great deal of effort on showing me what psycho-analysis is and what sort of knowledge is needed in order to practise it with some prospect of success. Very well. Listening to you can have done me no harm. But I do not know what influence on my judgement you expect your explanations to have. I see before me a case which has nothing unusual about it. The neuroses are a particular kind of illness and analysis is a particular method of treating them - a specialized branch of medicine. It is the rule in other cases as well for a doctor who has chosen a special branch of medicine not to be satisfied with the education that is confirmed by his diploma: particularly if he intends to set up in a fairly large town, such as can alone offer a livelihood to specialists. Anyone who wants to be a surgeon tries to work for a few years at a surgical clinic, and similarly with oculists, laryngologists and so on - to say nothing of psychiatrists, who are perhaps never able to get away from a state institution or a sanatorium. And the same will happen in the case of psycho-analysts: anyone who decides in favour of this new specialized branch of medicine will, when his studies are completed, take on the two years' training you spoke of in a training institute, if it really requires so much time. He will realize afterwards, too, that it is to his advantage to keep up his contact with his colleagues in a psycho-analytical society, and everything will go along swimmingly. I cannot see where there is a place in this for the question of lay analysis.'

A doctor who does what you have promised on his behalf will be welcome to all of us. Four-fifths of those whom I recognize as my pupils are in any case doctors. But allow me to point out to you how the relations of doctors to analysis have really developed and how they will probably continue to develop. Doctors have no historical claim to the sole possession of analysis. On the contrary, until recently they have met it with everything possible that could damage it, from the shallowest ridicule to the gravest calumny. You will justly reply that that belongs to the past and need not affect the future. I agree, but I fear the future will be different from what you have foretold.

Permit me to give the word 'quack' the meaning it ought to have instead of the legal one. According to the law a quack is anyone who treats patients without possessing a state diploma to prove he is a doctor. I should prefer another definition: a quack is anyone who undertakes a treatment without possessing the knowledge and capacities necessary for it. Taking my stand on this definition, I venture to assert that - not only in European countries - doctors form a preponderating contingent of quacks in analysis. They very frequently practise analytic treatment without having learnt it and without understanding it.

It is no use your objecting that that is unconscientious and that you cannot believe doctors capable of it; that after all a doctor knows that a medical diploma is not a letter of marque and that a patient is not an outlaw; and that one must always grant to a doctor that he is acting in good faith even if he may perhaps be in error.

The facts remain; we will hope that they can be accounted for as you think. I will try to explain to you how it becomes possible for a doctor to act in connection with psycho-analysis in a manner which he would carefully avoid in every other field.

The first consideration is that in his medical school a doctor receives a training which is more or less the opposite of what he would need as a preparation for psycho-analysis. His attention has been directed to objectively ascertainable facts of anatomy, physics and chemistry, on the correct appreciation and suitable influencing of which the success of medical treatment depends. The problem of life is brought into his field of vision so far as it has hitherto been explained to us by the play of forces which can also be observed in inanimate nature. His interest is not aroused in the mental side of vital phenomena; medicine is not concerned with the study of the higher intellectual functions, which lies in the sphere of another faculty. Only psychiatry is supposed to deal with the disturbances of mental functions; but we know in what manner and with what aims it does so. It looks for the somatic determinants of mental disorders and treats them like other causes of illness.

Psychiatry is right to do so and medical education is clearly excellent. If it is described as one-sided, one must first discover the standpoint from which one is making that characteristic into a reproach. In itself every science is one-sided. It must be so, since it restricts itself to particular subjects, points of view and methods. It is a piece of nonsense in which I would take no part to play off one science against another. After all, physics does not diminish the value of chemistry; it cannot take its place but on the other hand cannot be replaced by it. Psycho-analysis is certainly quite particularly one-sided, as being the science of the mental unconscious. We must not therefore dispute to the medical sciences their right to be one-sided.

We shall only find the standpoint we are in search of if we turn from scientific medicine to practical therapeutics. A sick person is a complicated organism. He may remind us that even the mental phenomena which are so hard to grasp should not be effaced from the picture of life. Neurotics, indeed, are an undesired complication, an embarrassment as much to therapeutics as to jurisprudence and to military service. But they exist and are a particular concern of medicine. Medical education, however, does nothing, literally nothing, towards their understanding and treatment. In view of the intimate connection between the things that we distinguish as physical and mental, we may look forward to a day when paths of knowledge and, let us hope, of influence will be opened up, leading from organic biology and chemistry to the field of neurotic phenomena. That day still seems a distant one, and for the present these illnesses are inaccessible to us from the direction of medicine.

It would be tolerable if medical education merely failed to give doctors any orientation in the field of the neuroses. But it does more: it gives them a false and detrimental attitude. Doctors whose interest has not been aroused in the psychical factors of life are all too ready to form a low estimate of them and to ridicule them as unscientific. For that reason they are unable to take anything really seriously which has to do with them and do not recognize the obligations which derive from them. They therefore fall into the layman's lack of respect for psychological research and make their own task easy for themselves. - No doubt neurotics have to be treated, since they are sick people and come to the doctor; and one must always be ready to experiment with something new. But why burden oneself with a tedious preparation? We shall manage all right; who can tell if what they teach in the analytic institutes is any good? - The less such doctors understand about the matter, the more venturesome they become. Only a man who really knows is modest, for he knows how insufficient his knowledge is.

The comparison which you brought up to pacify me, between specialization in analysis and in other branches of medicine, is thus not applicable. For surgery, ophthalmology, and so on, the medical school itself offers an opportunity for further education. The analytic training institutes are few in number, young in years, and without authority. The medical schools have not recognized them and take no notice of them. The young doctor, who has had to take so much on trust from his teachers that he has had little occasion for educating his judgement, will gladly seize an occasion for playing the part of a critic for once in a field in which there is as yet no recognized authority.

There are other things too that favour his appearing as an analytic quack. If he tried to undertake eye-operations without sufficient preparation, the failure of his cataract extractions and iridectomies and the absence of patients would soon bring his hazardous enterprise to an end. The practice of analysis is comparatively safe for him. The public is spoilt by the average successful outcome of eye-operations and expects cure from the surgeon. But if a 'nerve-specialist' fails to restore his patients no one is surprised. People have not been spoilt by successes in the therapy of the neuroses; the nerve-specialist has at least 'taken a lot of trouble with them'. Indeed, there is not much that can be done; nature must help, or time. With women there is first menstruation, then marriage, and later on the menopause. Finally death is a real help. Moreover, what the medical analyst has done with his neurotic patient is so inconspicuous that no reproach can attach to it. He has made use of no instruments or medicines; he has merely conversed with him and tried to talk him into or out of something. Surely that can do no harm, especially if he avoids touching on distressing or agitating subjects. The medical analyst, who has avoided any strict teaching, will, no doubt, not have omitted an attempt to improve analysis, to pull out its poison fangs and make it pleasant for the patient. And it will be wise for him to stop there; for if he really ventures to call up resistances and then does not know how to meet them, he may in true earnest make himself unpopular.

Honesty compels me to admit that the activity of an untrained analyst does less harm to his patients than that of an unskilled surgeon. The possible damage is limited to the patient having been led into useless expenditure and having his chances of recovery removed or diminished. Furthermore, the reputation of analytic therapy has been lowered. All this is most undesirable, but it bears no comparison with the dangers that threaten from the knife of a surgical quack. In my judgement, severe or permanent aggravations of a pathological condition are not to be feared even with an unskilled use of analysis. The unwelcome reactions cease after a while. Compared with the traumas of life which have provoked the illness, a little mishandling by the doctor is of no account. It is simply that the unsuitable attempt at a cure has done the patient no good.

‘I have listened to your account of the medical quack in analysis without interrupting you, though I formed an impression that you are dominated by a hostility against the medical profession to the historical explanation of which you yourself have pointed the way. But I will grant you one thing: if analyses are to be carried out, it should be by people who have been thoroughly trained for it. And do you not think that with time the doctors who turn to analysis will do everything to obtain that training?’

I fear not. So long as the attitude of the medical school to the analytic training institute remains unaltered, doctors will find the temptation to make things easier for themselves too great.

‘But you seem to be consistently evading any direct pronouncement on the question of lay analysis. What I guess now is that, because it is impossible to keep a check on doctors who want to analyse, you are proposing, out of revenge, as it were, to punish them by depriving them of their monopoly in analysis and by throwing open this medical activity to laymen as well.’

I cannot say whether you have guessed my motives correctly. Perhaps I shall be able later on to put evidence before you of a less partial attitude. But I lay stress on the demand that *no one should practise analysis who has not acquired the right to do so by a particular training*. Whether such a person is a doctor or not seems to me immaterial.

‘Then what definite proposals have you to make?’

I have not got so far as that yet; and I cannot tell whether I shall get there at all. I should like to discuss another question with you, and first of all to touch on one special point. It is said that the authorities, at the instigation of the medical profession, want to forbid the practice of analysis by laymen altogether. Such a prohibition would also affect the non-medical members of the Psycho-Analytical Society, who have enjoyed an excellent training and have perfected themselves greatly by practice. If the prohibition were enacted, we should find ourselves in a position in which a number of people are prevented from carrying out an activity which one can safely feel convinced they can perform very well, while the same activity is opened to other people for whom there is no question of a similar guarantee. That is not precisely the sort of result to which legislation should lead. However, this special problem is neither very important nor difficult to solve. Only a handful of people are concerned, who cannot be seriously damaged. They will probably emigrate to Germany where no legislation will prevent them from finding recognition for their proficiency. If it is desired to spare them this and to mitigate the law's severity, that can easily be done on the basis of some well-known precedents. Under the Austrian Monarchy it repeatedly happened that permission was given to notorious quacks, *ad personam*, to carry out medical activities in certain fields, because people were convinced of their real ability. Those concerned were for the most part peasant healers, and their recommendation seems regularly to have been made by one of the Archduchesses who were once so numerous; but it ought to be possible for it also to be done in the case of town-dwellers and on the basis of a different and merely expert guarantee. Such a prohibition would have more important effects on the Vienna analytic training institute, which would thenceforward be unable to accept any candidates for training from non-medical circles. Thus once again in our country a line of intellectual activity would be suppressed which is allowed to develop freely elsewhere. I am the last person to claim any competence in judging laws and regulations. But this much I can see: that to lay emphasis on our quackery law does not lead in the direction of the approach to conditions in Germany which is so much aimed at to-day, and that the application of that law to the case of psycho-analysis has something of an anachronism about it, since at the time of its enactment there was as yet no such thing as analysis and the peculiar nature of neurotic illnesses was not yet recognized.

I come now to a question the discussion of which seems to me more important. Is the practice of psycho-analysis a matter which should in general be subject to official interference, or would it be more expedient to leave it to follow its natural development? I shall certainly not come to any decision on this point here and now, but I shall take the liberty of putting the problem before you for your consideration. In our country from of old a positive *furor prohibendi* has been the rule, a tendency to keep people under tutelage, to interfere and to forbid, which, as we all know, has not borne particularly good fruit. In our new republican Austria, it seems, things have not yet changed very much. I fancy you will have an important word to say in deciding the case of psycho-analysis which we are now considering; I do not know whether you have the wish or the influence with which to oppose these bureaucratic tendencies. At all events, I shall not spare you my unauthoritative thoughts on the subject. In my opinion a superabundance of regulations and prohibitions injures the authority of the law. It can be observed that where only a few prohibitions exist they are carefully observed, but where one is accompanied by prohibitions at every step, one feels definitely tempted to disregard them. Moreover, it does not mean one is quite an anarchist if one is prepared to realize that laws and regulations cannot from their origin claim to possess the attribute of being sacred and untransgressable, that they are often inadequately framed and offend our sense of justice, or will do so after a time, and that, in view of the sluggishness of the authorities, there is often no other means of correcting such inexpedient laws than by boldly violating them. Furthermore, if one desires to maintain respect for laws and regulations it is advisable not to enact any where a watch cannot easily be kept on whether they are obeyed or transgressed. Much of what I have quoted above on the practice of analysis by doctors could be repeated here in regard to genuine analysis by laymen which the law is seeking to suppress. The course of an analysis is most inconspicuous, it employs neither medicines nor instruments and consists only in talking and an exchange of information; it will not be easy to prove that a layman is practising 'analysis', if he asserts that he is merely giving encouragement and explanations and trying to establish a healthy human influence on people who are in search of mental assistance. It would surely not be possible to forbid that merely because doctors sometimes do the same thing. In English-speaking countries the practices of Christian Science have become very widespread: a kind of dialectical denial of the evils in life, based on an appeal to the doctrines of the Christian religion. I do not hesitate to assert that that procedure represents a regrettable aberration of the human spirit; but who in America or England would dream of forbidding it and making it punishable? Are the authorities so certain of the right path to salvation that they venture to prevent each man from trying 'to be saved after his own fashion'. And granted that many people if they are left to themselves run into danger and come to grief, would not the authorities do better carefully to mark the limits of the regions which are to be regarded as not to be trespassed upon, and for the rest, so far as possible, to allow human beings to be educated by experience and mutual influence? Psycho-analysis is something so new in the world, the mass of mankind is so little instructed about it, the attitude of official science to it is still so vacillating, that it seems to me over-hasty to intervene in its development with legislative regulations. Let us allow patients themselves to discover that it is damaging to them to look for mental assistance to people who have not learnt how to give it. If we explain this to them and warn them against it, we shall have spared ourselves the need to forbid it. On the main roads of Italy the pylons that carry high-tension cables bear the brief and impressive inscription: '*Chi tocca, muore.*' This is perfectly calculated to regulate the behaviour of passers-by to any wires that may be hanging down. The corresponding German notices exhibit an unnecessary and offensive verbosity: '*Das Berühren der Leitungsdrähte ist, weil lebensgefährlich, strengstens verboten.*' Why the prohibition? Anyone who holds his life dear will make the prohibition for himself; and anyone who wants to kill himself in that way will not ask for permission.

‘But there are instances that can be quoted as legal precedents against allowing lay analysis; I mean the prohibition against laymen practising hypnotism and the recently enacted prohibition against holding spiritualist seances or founding spiritualist societies.’

I cannot say that I am an admirer of these measures. The second one is a quite undisguised encroachment of police supervision to the detriment of intellectual freedom. I am beyond suspicion of having much belief in what are known as ‘occult phenomena’ or of feeling any desire that they should be recognized. But prohibitions like these will not stifle people’s interest in that supposedly mysterious world. They may on the contrary have done much harm and have closed the door to an impartial curiosity which might have arrived at a judgement that would have set us free from these harassing possibilities. But once again this only applies to Austria. In other countries ‘para-psychical’ researches are not met by any legal obstacles. The case of hypnotism is somewhat different from that of analysis. Hypnotism is the evoking of an abnormal mental state and is used by laymen to-day only for the purpose of public shows. If hypnotic therapy had maintained its very promising beginnings, a position would have been arrived at similar to that of analysis. And incidentally the history of hypnotism provides a precedent for that of analysis in another direction. When I was a young lecturer in neuropathology, the doctors inveighed passionately against hypnotism, declared that it was a swindle, a deception of the Devil’s and a highly dangerous procedure. To-day they have monopolized this same hypnotism and they make use of it unhesitatingly as a method of examination; for some nerve specialists it is still their chief therapeutic instrument.

But I have already told you that I have no intention of making proposals which are based on the decision as to whether legal control or letting things go is to be preferred in the matter of analysis. I know this is a question of principle on the reply to which the inclinations of persons in authority will probably have more influence than arguments. I have already set out what seems to me to speak in favour of a policy of *laissez faire*. If the other decision is taken - for a policy of active intervention - then it seems to me that in any case a lame and unjust measure of ruthlessly forbidding analysis by non-doctors will be an insufficient outcome. More will have to be considered in that case: the conditions will have to be laid down under which the practice of analysis shall be permitted to all those who seek to make use of it, an authority will have to be set up from whom one can learn what analysis is and what sort of preparation is needed for it, and the possibilities for instruction in analysis will have to be encouraged. We must therefore either leave things alone or establish order and clarity; we must not rush into a complicated situation with a single isolated prohibition derived mechanically from a regulation that has become inadequate.

VII

'Yes, but the doctors! the doctors! I cannot induce you to go into the real subject of our conversations. You still keep on evading me. It is a question of whether we should not give doctors the exclusive right of practising analysis - for all I care, after they have fulfilled certain conditions. The majority of doctors are certainly not quacks in analysis as you have represented them. You say yourself that the great majority of your pupils and followers are doctors. It has come to my ears that they are far from sharing your point of view on the question of lay analysis. I may no doubt assume that your pupils agree with your demands for sufficient preparation and so on; and yet these pupils think it consistent to close the practice of analysis to laymen. Is that so? and if so, how do you explain it?'

I see you are well informed. Yes, it is so. Not all, it is true, but a good proportion of my medical colleagues do not agree with me over this, and are in favour of doctors having an exclusive right to the analytic treatment of neurotics. This will show you that differences of opinion are allowed even in our camp. The side I take is well known and the contradiction on the subject of lay analysis does not interfere with our good understanding. How can I explain the attitude of these pupils of mine to you? I do not know for certain; I think it must be the power of professional feeling. The course of their development has been different from mine, they still feel uncomfortable in their isolation from their colleagues, they would like to be accepted by the 'profession' as having plenary rights, and are prepared, in exchange for that tolerance, to make a sacrifice at a point whose vital importance is not obvious to them. Perhaps it may be otherwise; to impute motives of competition to them would be not only to accuse them of base sentiments but also to attribute a strange shortsightedness to them. They are always ready to introduce other doctors into analysis, and from a material point of view it must be a matter of indifference to them whether they have to share the available patients with medical colleagues or with laymen. But something different probably plays a part. These pupils of mine may be influenced by certain factors which guarantee a doctor an undoubted advantage over a layman in analytic practice.

'Guarantee him an advantage? There we have it. So you are admitting the advantage at last? This should settle the question.'

The admission is not hard for me to make. It may show you that I am not so passionately prejudiced as you suppose. I have put off mentioning these things because their discussion will once again make theoretical considerations necessary.

'What are you thinking of now?'

First there is the question of diagnosis. When one takes into analysis a patient suffering from what are described as nervous disorders, one wishes beforehand to be certain - so far, of course, as certainty can be attained - that he is suited for this kind of treatment, that one can help him, that is to say, by this method. That, however, is only the case if he really has a neurosis.

'I should have thought that would be recognizable from the phenomena, the symptoms, of which he complains.'

This is where a fresh complication arises. It cannot always be recognized with complete certainty. The patient may exhibit the external picture of a neurosis, and yet it may be something else - the beginning of an incurable mental disease or the preliminary of a destructive process in the brain. The distinction - the differential diagnosis - is not always easy and cannot be made immediately in every phase. The responsibility for such a decision can of course only be undertaken by a doctor. As I have said, it is not always easy for him. The illness may have an innocent appearance for a considerable time, till in the end it after all displays its evil character. Indeed, it is one of the regular fears of neurotics that they may become insane. However, if a doctor has been mistaken for a time over a case of this sort or has been in uncertainty about it, no harm has been caused and nothing unnecessary has been done. Nor indeed would the analytic treatment of this case have done any harm, though it would have been exposed as an unnecessary waste. And moreover there would certainly be enough people who would blame the analysis for the unfortunate outcome. Unjustly, no doubt, but such occasions ought to be avoided.

'But that sounds hopeless. It strikes at the roots of everything you have told me about the nature and origin of a neurosis.'

Not at all. It merely confirms once again the fact that neurotics are a nuisance and an embarrassment for all concerned - including the analysts. But perhaps I shall clear up your confusion if I state my new information in more correct terms. It would probably be more correct to say of the cases we are now dealing with that they have readily developed a neurosis, but that it is not psychogenic but somatogenic - that its causes are not mental but physical. Do you understand?

‘Oh, yes, I understand. But I cannot bring it into harmony with the other side, the psychological one.’

That can be managed, though, if one bears in mind the complexities of living substance. In what did we find the essence of a neurosis? In the fact that the ego, the higher organization of the mental apparatus (elevated through the influence of the external world), is not able to fulfil its function of mediating between the id and reality, that in its feebleness it draws back from some instinctual portions of the id and, to make up for this, has to put up with the consequences of its renunciation in the form of restrictions, symptoms and unsuccessful reaction-formations.

A feebleness of the ego of this sort is to be found in all of us in childhood; and that is why the experiences of the earliest years of childhood are of such great importance for later life. Under the extraordinary burden of this period of childhood we have in a few years to cover the enormous developmental distance between stone-age primitive men and the participants in contemporary civilization, and, at the same time and in particular, we have to fend off the instinctual impulses of the early sexual period - under this burden, then, our ego takes refuge in repression and lays itself open to a childhood neurosis, the precipitate of which it carries with it into maturity as a disposition to a later nervous illness. Everything now depends on how the growing organism is treated by fate. If life becomes too hard, if the gulf between instinctual claims and the demands of reality becomes too great, the ego may fail in its efforts to reconcile the two, and the more readily, the more it is inhibited by the disposition carried over by it from infancy. The process of repression is then repeated, the instincts tear themselves away from the ego's domination, find their substitutive satisfactions along the paths of regression, and the poor ego has become helplessly neurotic.

Only let us hold fast to this: the nodal point and pivot of the whole situation is the relative strength of the ego organization. We shall then find it easy to complete our aetiological survey. As what may be called the normal causes of neurotic illness we already know the feebleness of the childhood ego, the task of dealing with the early sexual impulses and the effects of the more or less chance experiences of childhood. Is it not possible, however, that yet other factors play a part, derived from the time before the beginning of the child's life? For instance, an innate strength and unruliness of the instinctual life in the id, which from the outset sets the ego tasks too hard for it? Or a special developmental feebleness of the ego due to unknown reasons? Such factors must of course acquire an aetiological importance, in some cases a transcendent one. We have invariably to reckon with the instinctual strength of the id; if it has developed to excess, the prospects of our therapy are poor. We still know too little of the causes of a developmental inhibition of the ego. These then would be the cases of neurosis with an essentially constitutional basis. Without some such constitutional, congenital favouring factors a neurosis can, no doubt, scarcely come about.

But if the relative feebleness of the ego is the decisive factor for the genesis of a neurosis, it must also be possible for a later physical illness to produce a neurosis, provided that it can bring about an enfeeblement of the ego. And that, once again, is very frequently found. A physical disorder of this kind can affect the instinctual life in the id and increase the strength of the instincts beyond the limit up to which the ego is capable of coping with them. The normal model of such processes is perhaps the alteration in women caused by the disturbances of menstruation and the menopause. Or again, a general somatic illness, indeed an organic disease of the nervous central organ, may attack the nutritional conditions of the mental apparatus and compel it to reduce its functioning and to bring to a halt its more delicate workings, one of which is the maintenance of the ego organization. In all these cases approximately the same picture of neurosis emerges; neurosis always has the same psychological mechanism, but, as we see, a most varied and often very complex aetiology.

‘You please me better now. You have begun talking like a doctor at last. And now I expect you to admit that such a complicated medical affair as a neurosis can only be handled by a doctor.’

I fear you are overshooting the mark. What we have been discussing was a piece of pathology, what we are concerned with in analysis is a therapeutic procedure. I allow - no, I insist - that in every case which is under consideration for analysis the diagnosis shall be established first by a doctor. Far the greater number of neuroses which occupy us are fortunately of a psychogenic nature and give no grounds for pathological suspicions. Once the doctor has established this, he can confidently hand over the treatment to a lay analyst. In our analytical societies matters have always been arranged in that way. Thanks to the intimate contact between medical and non-medical members, mistakes such as might be feared have been as good as completely avoided. There is a further contingency, again, in which the analyst has to ask the doctor's help. In the course of an analytic treatment, symptoms - most often physical symptoms - may appear about which one is doubtful whether they should be regarded as belonging to the neurosis or whether they should be related to an independent organic illness that has intervened. The decision on this point must once again be left to a doctor.

‘So that even during the course of an analysis a lay analyst cannot do without a doctor. A fresh argument against their fitness.’

No. No argument against lay analysts can be manufactured out of this possibility, for in such circumstances a medical analyst would not act differently.

‘I do not understand that.’

There is a technical rule that an analyst, if dubious symptoms like this emerge during the treatment, shall not submit them to his own judgement but shall get them reported upon by a doctor who is not connected with analysis - a consultant physician, perhaps - even if the analyst himself is a doctor and still well versed in his medical knowledge.

‘And why should a rule be made that seems to me so uncalled-for?’

It is not uncalled-for; in fact there are several reasons for it. In the first place it is not a good plan for a combination of organic and psychical treatment to be carried out by one and the same person. Secondly the relation in the transference may make it inadvisable for the analyst to examine the patient physically. And thirdly the analyst has every reason for doubting whether he is unprejudiced, since his interests are directed so intensely to the psychical factors.

'I now understand your attitude to lay analysis quite clearly. You are determined that there must be lay analysts. And since you cannot dispute their inadequacy for their task, you are scraping together everything you can to excuse them and make their existence easier. But I cannot in the least see why there should be lay analysts, who, after all, can only be therapists of the second class. I am ready, so far as I am concerned, to make an exception in the case of the few laymen who have already been trained as analysts; but no fresh ones should be created and the training institutes should be put under an obligation to take no more laymen into training.'

I am at one with you, if it can be shown that all the interests involved will be served by this restriction. You will agree that these interests are of three sorts: that of the patients, that of the doctors and - last not least - that of science, which indeed comprises the interests of all future patients. Shall we examine these three points together?

For the patient, then, it is a matter of indifference whether the analyst is a doctor or not, provided only that the danger of his condition being misunderstood is excluded by the necessary medical report before the treatment begins and on some possible occasions during the course of it. For him it is incomparably more important that the analyst should possess personal qualities that make him trustworthy, and that he should have acquired the knowledge and understanding as well as the experience which alone can make it possible for him to fulfil his task. It might be thought that it would damage an analyst's authority if the patient knows that he is not a doctor and cannot in some situations do without a doctor's support. We have, of course, never omitted to inform patients of their analyst's qualification, and we have been able to convince ourselves that professional prejudices find no echo in them and that they are ready to accept a cure from whatever direction it is offered them - which, incidentally, the medical profession discovered long ago to its deep mortification. Nor are the lay analysts who practise analysis to-day any chance collection of riff-raff, but people of academic education, doctors of philosophy, educationalists, together with a few women of great experience in life and outstanding personality. The analysis, to which all the candidates in an analytic training institute have to submit, is at the same time the best means of forming an opinion of their personal aptitude for carrying out their exacting occupation.

Now as to the interest of the doctors. I cannot think that it would gain by the incorporation of psycho-analysis into medicine. The medical curriculum already lasts for five years and the final examinations extend well into a sixth year. Every few years fresh demands are made on the student, without the fulfilment of which his equipment for the future would have to be declared insufficient. Access to the medical profession is very difficult and its practice neither very satisfying nor very remunerative. If one supports what is certainly a fully justified demand that doctors should also be familiar with the mental side of illness, and if on that account one extends medical education to include some preparation for analysis, that implies a further increase in the curriculum and a corresponding prolongation of the period of study. I do not know whether the doctors will be pleased by this consequence of their claim upon analysis. But it can scarcely be escaped. And this at a period in which the conditions of material existence have so greatly deteriorated for the classes from which doctors are recruited, a period in which the younger generation sees itself compelled to make itself self-supporting as early in life as possible.

But perhaps you will choose not to burden medical studies with the preparation for analytic practice but think it more expedient for future analysts to take up their necessary training only after the end of their medical studies. You may say the loss of time involved in this is of no practical account, since after all a young man of less than thirty will never enjoy his patients' confidence, which is a *sine qua non* of giving mental assistance. It might no doubt be said in reply that a newly-fledged physician for physical illnesses cannot count upon being treated by his patients with very great respect either, and that a young analyst might very well fill in his time by working in a psycho-analytic out-patient clinic under the supervision of experienced practitioners.

But what seems to me more important is that with this proposal of yours you are giving support to a waste of energy for which, in these difficult times, I can really find no economic justification. Analytic training, it is true, cuts across the field of medical education, but neither includes the other. If - which may sound fantastic to-day - one had to found a college of psycho-analysis, much would have to be taught in it which is also taught by the medical faculty: alongside of depth-psychology, which would always remain the principal subject, there would be an introduction to biology, as much as possible of the science of sexual life, and familiarity with the symptomatology of psychiatry. On the other hand, analytic instruction would include branches of knowledge which are remote from medicine and which the doctor does not come across in his practice: the history of civilization, mythology, the psychology of religion and the science of literature. Unless he is well at home in these subjects, an analyst can make nothing of a large amount of his material. By way of compensation, the great mass of what is taught in medical schools is of no use to him for his purposes. A knowledge of the anatomy of the tarsal bones, of the constitution of the carbohydrates, of the course of the cranial nerves, a grasp of all that medicine has brought to light on bacillary exciting causes of disease and the means of combating them, on serum reactions and on neoplasms - all of this knowledge, which is undoubtedly of the highest value in itself, is nevertheless of no consequence to him; it does not concern him; it neither helps him directly to understand a neurosis and to cure it nor does it contribute to a sharpening of those intellectual capacities on which his occupation makes the greatest demands. It cannot be objected that the case is much the same when a doctor takes up some other special branch of medicine - dentistry, for instance: in that case, too, he may not need some of what he has to pass examinations in, and he will have to learn much in addition, for which his schooling has not prepared him. But the two cases cannot be put on a par. In dentistry the great principles of pathology - the theories of inflammation, suppuration, necrosis, and of the metabolism of the bodily organs - still retain their importance. But the experience of an analyst lies in another world, with other phenomena and other laws. However much philosophy may ignore the gulf between the physical and the mental, it still exists for our immediate experience and still more for our practical endeavours.

It is unjust and inexpedient to try to compel a person who wants to set someone else free from the torment of a phobia or an obsession to take the roundabout road of the medical curriculum. Nor will such an endeavour have any success, unless it results in suppressing analysis entirely. Imagine a landscape in which two paths lead to a hilltop with a view - one short and straight, the other long, winding and circuitous. You try to stop up the short path by a prohibitory notice, perhaps because it passes by some flower-beds that you want to protect. The only chance you have of your prohibition being respected is if the short path is steep and difficult while the longer one leads gently up. If, however, that is not so, and the roundabout path is on the contrary the harder, you may imagine the use of your prohibition and the fate of your flower-beds! I fear you will succeed in compelling the laymen to study medicine just as little as I shall be able to induce doctors to learn analysis. For you know human nature as well as I do.

'If you are right, that analytic treatment cannot be carried out without special training, but that the medical curriculum cannot bear the further burden of a preparation for it, and that medical knowledge is to a great extent unnecessary for an analyst, how shall we achieve the ideal physician who shall be equal to all the tasks of his calling?'

I cannot foresee the way out of these difficulties, nor is it my business to point it out. I see only two things, first that analysis is an embarrassment to you and that the best thing would be for it not to exist - though neurotics, no doubt, are an embarrassment too; and secondly, that the interests of everyone concerned would for the time being be met if the doctors could make up their minds to tolerate a class of therapists which would relieve them of the tedium of treating the enormously common psychogenic neuroses while remaining in constant touch with them to the benefit of the patients.

'Is that your last word on the subject? or have you something more to say?'

Yes indeed. I wanted to bring up a third interest - the interest of science. What I have to say about that will concern you little; but, by comparison, it is of all the more importance to me.

For we do not consider it at all desirable for psycho-analysis to be swallowed up by medicine and to find its last resting-place in a text-book of psychiatry under the heading 'Methods of Treatment', alongside of procedures such as hypnotic suggestion, autosuggestion, and persuasion, which, born from our ignorance, have to thank the laziness and cowardice of mankind for their short-lived effects. It deserves a better fate and, it may be hoped, will meet with one. As a 'depth-psychology', a theory of the mental unconscious, it can become indispensable to all the sciences which are concerned with the evolution of human civilization and its major institutions such as art, religion and the social order. It has already, in my opinion, afforded these sciences considerable help in solving their problems. But these are only small contributions compared with what might be achieved if historians of civilization, psychologists of religion, philologists and so on would agree themselves to handle the new instrument of research which is at their service. The use of analysis for the treatment of the neuroses is only one of its applications; the future will perhaps show that it is not the most important one. In any case it would be wrong to sacrifice all the other applications to this single one, just because it touches on the circle of medical interests.

For here a further prospect stretches ahead, which cannot be encroached upon with impunity. If the representatives of the various mental sciences are to study psycho-analysis so as to be able to apply its methods and angles of approach to their own material, it will not be enough for them to stop short at the findings which are laid down in analytic literature. They must learn to understand analysis in the only way that is possible - by themselves undergoing an analysis. The neurotics who need analysis would thus be joined by a second class of persons, who accept analysis from intellectual motives, but who will no doubt also welcome the increase in their capacities which they will incidentally achieve. To carry out these analyses a number of analysts will be needed, for whom any medical knowledge will have particularly little importance. But these 'teaching analysts' - let us call them - will require to have had a particularly careful education. If this is not to be stunted, they must be given an opportunity of collecting experience from instructive and informative cases; and since healthy people who also lack the motive of curiosity do not present themselves for analysis, it is once more only upon neurotics that it will be possible for the teaching analysts - under careful supervision - to be educated for their subsequent non-medical activity. All this, however, requires a certain amount of freedom of movement, and is not compatible with petty restrictions.

Perhaps you do not believe in these purely theoretical interests of psycho-analysis or cannot allow them to affect the practical question of lay analysis. Then let me advise you that psycho-analysis has yet another sphere of application, which is outside the scope of the quackery law and to which the doctors will scarcely lay claim. Its application, I mean, to the bringing-up of children. If a child begins to show signs of an undesirable development, if it grows moody, refractory and inattentive, the paediatrician and even the school doctor can do nothing for it, even if the child produces clear neurotic symptoms, such as nervousness, loss of appetite, vomiting or insomnia. A treatment that combines analytic influence with educational measures, carried out by people who are not ashamed to concern themselves with the affairs in a child's world, and who understand how to find their way into a child's mental life, can bring about two things at once: the removal of the neurotic symptoms and the reversal of the change in character which had begun. Our recognition of the importance of these inconspicuous neuroses of children as laying down the disposition for serious illnesses in later life points to these child analyses as an excellent method of prophylaxis. Analysis undeniably still has its enemies. I do not know whether they have means at their command for stopping the activities of these educational analysts or analytic educationalists. I do not think it very likely; but one can never feel too secure.

Moreover, to return to our question of the analytic treatment of adult neurotics, even there we have not yet exhausted every line of approach. Our civilization imposes an almost intolerable pressure on us and it calls for a corrective. Is it too fantastic to expect that psycho-analysis in spite of its difficulties may be destined to the task of preparing mankind for such a corrective? Perhaps once more an American may hit on the idea of spending a little money to get the 'social workers' of his country trained analytically and to turn them into a band of helpers for combating the neuroses of civilization.

The Question Of Lay Analysis

4391

‘Aha! a new kind of Salvation Army!’

Why not? Our imagination always follows patterns. The stream of eager learners who will then flow to Europe will be obliged to pass Vienna by, for here the development of analysis may have succumbed to a premature trauma of prohibition. You smile? I am not saying this as a bribe for your support. Not in the least. I know you do not believe me; nor can I guarantee that it will happen. But one thing I do know. It is by no means so important what decision you give on the question of lay analysis. It may have a local effect. But the things that really matter - the possibilities in psycho-analysis for *internal* development - can never be affected by regulations and prohibitions.

POSTSCRIPT
(1927)

The immediate occasion of my writing the small volume which was the starting-point of the present discussion was a charge of quackery brought against a non-medical member of our Society, Dr. Theodor Reik, in the Vienna Courts. It is generally known, I think, that after all the preliminary proceedings had been completed and a number of expert opinions had been received, the charge was dropped. I do not believe that this was a result of my book. No doubt the prosecution's case was too weak, and the person who brought the charge as an aggrieved party proved an untrustworthy witness. So that the quashing of the proceedings against Dr. Reik is probably not to be regarded as a considered judgement of the Vienna Courts on the general question of lay analysis. When I drew the figure of the 'Impartial Person' who was my interlocutor in my tract, I had before my mind one of our high officials. This was a man with a friendly attitude and a mind of unusual integrity, to whom I had myself talked about Reik's case and for whom I had, at his request, written a confidential opinion on the subject. I knew I had not succeeded in converting him to my views, and that was why I made my dialogue with the Impartial Person end without agreement too.

Nor did I expect that I should succeed in bringing about unanimity in the attitude of analysts themselves towards the problem of lay analysis. Anyone who compares the views expressed by the Hungarian Society in this discussion with those of the New York group will perhaps conclude that my book has produced no effect whatever and that everyone persists in his former opinion. But I do not believe this either. I think that many of my colleagues have modified their extreme *parti pris* and that the majority have accepted my view that the problem of lay analysis ought not to be decided along the lines of traditional usage but that it arises from a novel situation and therefore demands a fresh judgement.

Again, the turn which I gave to the whole discussion seems to have met with approval. My main thesis was that the important question is not whether an analyst possesses a medical diploma but whether he has had the special training necessary for the practice of analysis. This served as the starting-point for a discussion, which was eagerly embarked upon, as to what is the training most suitable for an analyst. My own view was and still remains that it is not the training prescribed by the University for future doctors. What is known as medical education appears to me to be an arduous and circuitous way of approaching the profession of analysis. No doubt it offers an analyst much that is indispensable to him. But it burdens him with too much else of which he can never make use, and there is a danger of its diverting his interest and his whole mode of thought from the understanding of psychical phenomena. A scheme of training for analysts has still to be created. It must include elements from the mental sciences, from psychology, the history of civilization and sociology, as well as from anatomy, biology and the study of evolution. There is so much to be taught in all this that it is justifiable to omit from the curriculum anything which has no direct bearing on the practice of analysis and only serves indirectly (like any other study) as a training for the intellect and for the powers of observation. It is easy to meet this suggestion by objecting that analytic colleges of this kind do not exist and that I am merely setting up an ideal. An ideal, no doubt. But an ideal which can and must be realized. And in our training institutes, in spite of all their youthful insufficiencies, that realization has already begun.

It will not have escaped my readers that in what I have said I have assumed as axiomatic something that is still violently disputed in the discussion. I have assumed, that is to say, that psycho-analysis is not a specialized branch of medicine. I cannot see how it is possible to dispute this. Psycho-analysis is a part of psychology; not of medical psychology in the old sense, not of the psychology of morbid processes, but simply of psychology. It is certainly not the whole of psychology, but its sub-structure and perhaps even its entire foundation. The possibility of its application to medical purposes must not lead us astray. Electricity and radiology also have their medical application, but the science to which they both belong is none the less physics. Nor can their situation be affected by historical arguments. The whole theory of electricity had its origin in an observation of a nerve-muscle preparation; yet no one would dream to-day of regarding it as a part of physiology. It is argued that psycho-analysis was after all discovered by a physician in the course of his efforts to assist his patients. But that is clearly neither here nor there. Moreover, the historical argument is double-edged. We might pursue the story and recall the unfriendliness and indeed the animosity with which the medical profession treated analysis from the very first. That would seem to imply that it can have no claims over analysis to-day. And though I do not accept that implication, I still feel some doubts as to whether the present wooing of psycho-analysis by the doctors is based, from the point of view of the libido theory, upon the first or upon the second of Abraham's sub-stages - whether they wish to take possession of their object for the purpose of destroying or of preserving it.

I should like to consider the historical argument a moment longer. Since it is with me personally that we are concerned, I can throw a little light, for anyone who may be interested, on my own motives. After forty-one years of medical activity, my self-knowledge tells me that I have never really been a doctor in the proper sense. I became a doctor through being compelled to deviate from my original purpose; and the triumph of my life lies in my having, after a long and roundabout journey, found my way back to my earliest path. I have no knowledge of having had any craving in my early childhood to help suffering humanity. My innate sadistic disposition was not a very strong one, so that I had no need to develop this one of its derivatives. Nor did I ever play the 'doctor game'; my infantile curiosity evidently chose other paths. In my youth I felt an overpowering need to understand something of the riddles of the world in which we live and perhaps even to contribute something to their solution. The most hopeful means of achieving this end seemed to be to enrol myself in the medical faculty; but even after that I experimented - unsuccessfully - with zoology and chemistry, till at last, under the influence of Brücke, who carried more weight with me than any one else in my whole life, I settled down to physiology, though in those days it was too narrowly restricted to histology. By that time I had already passed all my medical examinations; but I took no interest in anything to do with medicine till the teacher whom I so deeply respected warned me that in view of my impoverished material circumstances I could not possibly take up a theoretical career. Thus I passed from the histology of the nervous system to neuropathology and then, prompted by fresh influences, I began to be concerned with the neuroses. I scarcely think, however, that my lack of a genuine medical temperament has done much damage to my patients. For it is not greatly to the advantage of patients if their doctor's therapeutic interest has too marked an emotional emphasis. They are best helped if he carries out his task coolly and keeping as closely as possible to the rules.

No doubt what I have just said throws little light on the problem of lay analysis; it was only intended to exhibit my personal credentials as being myself a supporter of the inherent value of psycho-analysis and of its independence of its application to medicine. But it will be objected at this point that whether psycho-analysis, regarded as a science, is a subdivision of medicine or of psychology is a purely academic question and of no practical interest. The real point at issue, it will be said, is a different one, namely the application of analysis to the treatment of patients; in so far as it claims to do this it must be content, the argument will run, to be accepted as a specialized branch of medicine, like radiology, for instance, and to submit to the rules laid down for all therapeutic methods. I recognize that that is so; I admit it. I only want to feel assured that the therapy will not destroy the science. Unluckily analogies never carry one more than a certain distance; a point is soon reached at which the subjects of the comparison take divergent paths. The case of analysis differs from that of radiology. A physicist does not require to have a patient in order to study the laws that govern X-rays. But the only subject-matter of psycho-analysis is the mental processes of human beings and it is only in human beings that it can be studied. For reasons which can easily be understood, neurotic human beings offer far more instructive and accessible material than normal ones, and to withhold that material from anyone who wishes to study and apply analysis is to dock him of a good half of his training possibilities. I have, of course, no intention of asking that the interests of neurotic patients should be sacrificed to those of instruction and scientific research. The aim of my small volume on the question of lay analysis was precisely to show that, if certain precautions are observed, the two interests can quite easily be brought into harmony and that the interests of medicine, as rightly understood, will not be the last to profit by such a solution.

I myself brought forward all the necessary precautions and I can safely say that the discussion added nothing on this point. But I should like to remark that the emphasis was often placed in a manner which did not do justice to the facts. What was said about the difficulties of differential diagnosis and the uncertainty in many cases in deciding about somatic symptoms - situations, that is, in which medical knowledge and medical intervention are necessary - this is all of it perfectly true. Nevertheless, the number of cases in which doubts of this kind never arise at all and in which a doctor is *not* required is surely incomparably greater. These cases may be quite uninteresting scientifically, but they play an important enough part in life to justify the activity of lay analysts, who are perfectly competent to deal with them. Some time ago I analysed a colleague who gave evidence of a particularly strong dislike of the idea of anyone being allowed to engage in a medical activity who was not himself a medical man. I was in a position to say to him: 'We have now been working for more than three months. At what point in our analysis have I had occasion to make use of my medical knowledge?' He admitted that I had had no such occasion.

Again, I attach no great importance to the argument that a lay analyst, because he must be prepared to consult a doctor, will have no authority in the eyes of his patients and will be treated with no more respect than such people as bone-setters or masseurs. Once again, the analogy is an imperfect one - quite apart from the fact that what governs patients in their recognition of authority is usually their emotional transference and that the possession of a medical diploma does not impress them nearly so much as doctors believe. A professional lay analyst will have no difficulty in winning as much respect as is due to a secular pastoral worker. Indeed, the words, 'secular pastoral worker', might well serve as a general formula for describing the function which the analyst, whether he is a doctor or a layman, has to perform in his relation to the public. Our friends among the protestant clergy, and more recently among the catholic clergy as well, are often able to relieve their parishioners of the inhibitions of their daily life by confirming their faith - after having first offered them a little analytic information about the nature of their conflicts. Our opponents, the Adlerian 'individual psychologists', endeavour to produce a similar result in people who have become unstable and inefficient by arousing their interest in the social community after having first thrown some light upon a single corner of their mental life and shown them the part played in their illness by their egoistic and distrustful impulses. Both of these procedures, which derive their power from being based on analysis, have their place in psychotherapy. We who are analysts set before us as our aim the most complete and profoundest possible analysis of whoever may be our patient. We do not seek to bring him relief by receiving him into the catholic, protestant or socialist community. We seek rather to enrich him from his own internal sources, by putting at the disposal of his ego those energies which, owing to repression, are inaccessibly confined in his unconscious, as well as those which his ego is obliged to squander in the fruitless task of maintaining these repressions. Such activity as this is pastoral work in the best sense of the words. Have we set ourselves too high an aim? Are the majority of our patients worth the pains that this work requires of us? Would it not be more economical to prop up their weaknesses from without rather than to rebuild them from within? I cannot say; but there is something else that I *do* know. In psycho-analysis there has existed from the very first an inseparable bond between cure and research. Knowledge brought therapeutic success. It was impossible to treat a patient without learning something new; it was impossible to gain fresh insight without perceiving its beneficent results. Our analytic procedure is the only one in which this precious conjunction is assured. It is only by carrying on our analytic pastoral work that we can deepen our dawning comprehension of the human mind. This prospect of scientific gain has been the proudest and happiest feature of analytic work. Are we to sacrifice it for the sake of any considerations of a practical sort?

Some remarks that have been made in the course of this discussion have led me to suspect that, in spite of everything, my book on lay analysis has been misunderstood in one respect. The doctors have been defended against me, as though I had declared that they were in general incompetent to practise analysis and as though I had given it out as a password that medical reinforcements were to be rejected. That was not my intention. The idea probably arose from my having been led to declare in the course of my observations (which had a controversial end in view) that untrained medical analysts were even more dangerous than laymen. I might make my true opinion on this question clear by echoing a cynical remark about women that once appeared in *Simplicissimus*. One man was complaining to another about the weaknesses and troublesome nature of the fair sex. 'All the same,' replied his companion, 'women are the best thing we have of the kind.' I am bound to admit that, so long as schools such as we desire for the training of analysts are not yet in existence, people who have had a preliminary education in medicine are the best material for future analysts. We have a right to demand, however, that they should not mistake their preliminary education for a complete training, that they should overcome the one-sidedness that is fostered by instruction in medical schools and that they should resist the temptation to flirt with endocrinology and the autonomic nervous system, when what is needed is an apprehension of psychological facts with the help of a framework of psychological concepts. I also share the view that all those problems which relate to the connection between psychical phenomena and their organic, anatomical and chemical foundations can be approached only by those who have studied both, that is, by medical analysts. It should not be forgotten, however, that this is not the whole of psycho-analysis, and that for its other aspect we can never do without the co-operation of people who have had a preliminary education in the *mental* sciences. For practical reasons we have been in the habit - and this is true, incidentally, of our publications as well - of distinguishing between medical and applied analysis. But that is not a logical distinction. The true line of division is between *scientific* analysis and its *applications* alike in medical and in non-medical fields.

In these discussions the bluntest rejection of lay analysis has been expressed by our American colleagues. A few words to them in reply will, I think, not be out of place. I can scarcely be accused of making a misuse of analysis for controversial purposes if I express an opinion that their resistance is derived wholly from practical factors. They see how in their own country lay analysts put analysis to all kinds of mischievous and illegitimate purposes and in consequence cause injury both to their patients and to the good name of analysis. It is therefore not to be wondered at if in their indignation they give the widest possible berth to such unscrupulous mischief-makers and try to prevent any laymen from having a share in analysis. But these facts are already enough to diminish the significance of the American position; for the question of lay analysis must not be decided on practical considerations alone, and local conditions in America cannot be the sole determining influence on our views.

The resolution passed by our American colleagues against lay analysts, based as it essentially is upon practical reasons, appears to me nevertheless to be unpractical; for it cannot affect any of the factors which govern the situation. It is more or less equivalent to an attempt at repression. If it is impossible to prevent the lay analysts from pursuing their activities and if the public does not support the campaign against them, would it not be more expedient to recognize the fact of their existence by offering them opportunities for training? Might it not be possible in this way to gain some influence over them? And, if they were offered as an inducement the possibility of receiving the approval of the medical profession and of being invited to co-operate, might they not have some interest in raising their own ethical and intellectual level?

4400

PSYCHO-ANALYSIS

Since psycho-analysis was not mentioned in the eleventh edition of the *Encyclopaedia Britannica*, it is impossible to restrict this account to its advances since 1910. The more important and the more interesting portion of its history lies in the period before that date.

PREHISTORY

In the years 1880-2 a Viennese physician, Dr. Josef Breuer (1842-1925), discovered a new procedure by means of which he relieved a girl, who was suffering from severe hysteria, of her many and various symptoms. The idea occurred to him that the symptoms were connected with impressions which she had received during a period of agitation while she was nursing her sick father. He therefore induced her, while she was in a state of hypnotic somnambulism, to search for these connections in her memory and to live through the 'pathogenic' scenes once again without inhibiting the affects that arose in the process. He found that when she had done this the symptom in question disappeared for good.

This was at a date before the investigations of Charcot and Pierre Janet into the origin of hysterical symptoms, and Breuer's discovery was thus entirely uninfluenced by them. But he did not pursue the matter any further at the time, and it was not until some ten years later that he took it up again in collaboration with Sigmund Freud. In 1895 they published a book, *Studies on Hysteria*, in which Breuer's discoveries were described and an attempt was made to explain them by the theory of 'catharsis'. According to that hypothesis, hysterical symptoms originate through the energy of a mental process being withheld from conscious influence and being diverted into bodily innervation ('*conversion*'). A hysterical symptom would thus be a substitute for an omitted mental act and a reminiscence of the occasion which should have given rise to that act. And, on this view, recovery would be a result of the liberation of the affect that had gone astray and of its discharge along a normal path ('*abreaction*'). Cathartic treatment gave excellent therapeutic results, but it was found that they were not permanent and that they were not independent of the personal relation between the patient and the physician. Freud, who later proceeded with these investigations by himself, made an alteration in their technique, by replacing hypnosis by the method of free association. He invented the term 'psycho-analysis', which in the course of time came to have two meanings: (1) a particular method of treating nervous disorders and (2) the science of unconscious mental processes, which has also been appropriately described as 'depth-psychology'.

SUBJECT-MATTER OF PSYCHO-ANALYSIS

Psycho-analysis finds a constantly increasing amount of support as a therapeutic procedure, owing to the fact that it can do more for its patients than any other method of treatment. The principle field of its application is in the milder neuroses - hysteria, phobias and obsessional states; and in malformations of character and sexual inhibitions or abnormalities it can also bring about marked improvements or even recoveries. Its influence upon dementia praecox and paranoia is doubtful; on the other hand, in favourable circumstances it can cope with depressive states, even if they are of a severe type.

In every instance the treatment makes heavy claims upon both the physician and the patient: the former requires a special training and must devote a long period of time to exploring the mind of each patient, while the latter must make considerable sacrifices, both material and mental. Nevertheless, all the trouble involved is as a rule rewarded by the results. Psycho-analysis does not act as a convenient panacea (*'cito, tute, jucunde'*) for psychological disorders. On the contrary, its application has been instrumental in making clear for the first time the difficulties and limitations in the treatment of such affections. For the moment it is only in Berlin and Vienna that there are voluntary institutions which make psycho-analytic treatment accessible to the wage-earning classes.

The therapeutic influence of psycho-analysis depends on the replacement of unconscious mental acts by conscious ones and is effective within the limits of that factor. The replacement is effected by overcoming internal resistances in the patient's mind. The future will probably attribute far greater importance to psycho-analysis as the science of the unconscious than as a therapeutic procedure.

Psycho-analysis, in its character of depth-psychology, considers mental life from three points of view: the dynamic, the economic and the topographical.

From the first of these standpoints, the *dynamic* one, psycho-analysis derives all mental processes (apart from the reception of external stimuli) from the interplay of forces, which assist or inhibit one another, combine with one another, enter into compromises with one another, etc. All of these forces are originally in the nature of *instincts*; thus they have an organic origin. They are characterized by possessing an immense (somatic) store of power ('*the compulsion to repeat*'); and they are represented mentally as images or ideas with an affective charge. In psycho-analysis, no less than in other sciences, the theory of the instincts is an obscure subject. An empirical analysis leads to the formulation of two groups of instincts: the so-called 'ego-instincts', which are directed towards self-preservation, and the 'object-instincts', which are concerned with relations to an external object. The social instincts are not regarded as elementary or irreducible. Theoretical speculation leads to the suspicion that there are two fundamental instincts which lie concealed behind the manifest ego-instincts and object-instincts: namely (*a*) Eros, the instinct which strives for ever closer union, and (*b*) the instinct of destruction, which leads towards the dissolution of what is living. In psycho-analysis the manifestation of the force of Eros is given the name '*libido*'.

From the *economic* standpoint psycho-analysis supposes that the mental representatives of the instincts have a charge (*cathexis*) of definite quantities of energy, and that it is the purpose of the mental apparatus to hinder any damming-up of these energies and to keep as low as possible the total amount of the excitations with which it is loaded. The course of mental processes is automatically regulated by the '*pleasure-unpleasure principle*'; and unpleasure is thus in some way related to an increase of excitation and pleasure to a decrease. In the course of development the original pleasure principle undergoes a modification with reference to the external world, giving place to the '*reality principle*', in accordance with which the mental apparatus learns to postpone the pleasure of satisfaction and to tolerate temporarily feelings of unpleasure.

Topographically, psycho-analysis regards the mental apparatus as a compound instrument, and endeavours to determine at what points in it the various mental processes take place. According to the most recent psycho-analytic views, the mental apparatus is composed of an '*id*', which is the repository of the instinctual impulses, of an '*ego*', which is the most superficial portion of the id and one which has been modified by the influence of the external world, and of a '*super-ego*', which develops out of the id, dominates the ego and represents the inhibitions of instinct that are characteristic of man. The quality of consciousness, too, has a topographical reference; for processes in the id are entirely unconscious, while consciousness is the function of the ego's outermost layer, which is concerned with the perception of the external world.

At this point two observations may be in place. It must not be supposed that these very general ideas are presuppositions upon which the work of psycho-analysis depends. On the contrary, they are its latest conclusions and are 'open to revision'. Psycho-analysis is founded securely upon the observation of the facts of mental life; and for that very reason its theoretical superstructure is still incomplete and subject to constant alteration. Secondly, there is no reason for surprise that psycho-analysis, which was originally no more than an attempt at explaining pathological mental phenomena, should have developed into a psychology of normal mental life. The justification for this arose with the discovery that the dreams and mistakes of normal men have the same mechanism as neurotic symptoms.

The first task of psycho-analysis was the elucidation of nervous disorders. The analytic theory of the neuroses is based on three corner-stones: the recognition of (1) '*repression*', of (2) the importance of the sexual instinct and of (3) '*transference*'.

(1) There is a force in the mind which exercises the functions of a censorship, and which excludes from consciousness and from any influence upon action all tendencies which displease it. Such tendencies are described as 'repressed'. They remain unconscious; and if one attempts to bring them into the patient's consciousness one provokes a '*resistance*'. These repressed instinctual impulses, however, have not always become powerless. In many cases they succeed in making their influence felt in the mind by circuitous paths, and the indirect or substitutive satisfactions of repressed impulses thus achieved are what constitute neurotic symptoms.

(2) For cultural reasons the most intense repression falls upon the sexual instincts; but it is precisely in connection with them that repression most easily miscarries, so that neurotic symptoms are found to be substitutive satisfactions of repressed sexuality. The belief that in man sexual life begins only at puberty is incorrect. On the contrary, signs of it can be detected from the beginning of extra-uterine existence; it reaches a first culminating point at or before the fifth year ('early period'), after which it is inhibited or interrupted ('latency period') until the age of puberty, which is the second climax of its development. This diphasic onset of sexual development seems to be distinctive of the genus Homo. All experiences during the first period of childhood are of the greatest importance to the individual, and in combination with his inherited sexual constitution form the dispositions for the subsequent development of character and disease. It is wrong to make sexuality coincide with 'genitality'. The sexual instincts pass through a complicated course of development, and it is only at the end of it that the 'primacy of the genital zones' is attained. Before this there are a number of 'pregenital' organizations of the libido - points at which it may become 'fixated' and to which, in the event of subsequent repression, it will return ('*regression*'). The infantile fixations of the libido are what determine the form of any later neurosis. Thus the neuroses are to be regarded as inhibitions in the development of the libido. There are no specific causes of nervous disorders; the question whether a conflict finds a healthy solution or leads to a neurotic inhibition of function depends upon quantitative considerations.

The most important conflict with which a small child is faced is his relation to his parents, the '*Oedipus complex*'; it is in attempting to grapple with this problem that those destined to suffer from a neurosis habitually come to grief. The reactions against the instinctual demands of the Oedipus complex are the source of the most precious and socially important achievements of the human mind; and this holds true not only in the life of individuals but probably also in the history of the human species as a whole. The super-ego, too, the moral agency which dominates the ego, has its origin in the process of overcoming the Oedipus complex.

(3) By '*transference*' is meant a striking peculiarity of neurotics. They develop towards their physician emotional relations, both of an affectionate and hostile character, which are not based upon the actual situation but are derived from their relations to their parents (the Oedipus complex). Transference is a proof of the fact that adults have not overcome their former childish dependence; it coincides with the force which has been named 'suggestion'; and it is only by learning to make use of it that the physician is enabled to induce the patient to overcome his internal resistances and do away with his repressions. Thus psycho-analytic treatment acts as a second education of the adult, as a corrective to his education as a child.

Within this narrow compass it has been impossible to mention many matters of the greatest interest, such as the '*sublimation*' of instincts, the part played by *symbolism*, the problem of '*ambivalence*', etc. Nor has there been space to allude to the applications of psycho-analysis, which originated, as we have seen, in the sphere of medicine, to other departments of knowledge (such as Social Anthropology, the Study of Religion, Literary History and Education) where its influence is constantly increasing. It is enough to say that psycho-analysis, in its character of the psychology of the deepest, unconscious mental acts, promises to become the link between psychiatry and all of these other branches of mental science.

THE EXTERNAL HISTORY OF PSYCHO-ANALYSIS

The beginnings of psycho-analysis may be marked by two dates: 1895, which saw the publication of Breuer and Freud's *Studies on Hysteria*, and 1900, which saw that of Freud's *Interpretation of Dreams*. At first the new discoveries aroused no interest either in the medical profession or among the general public. In 1907 the Swiss psychiatrists, under the leadership of E. Bleuler and C. G. Jung, began to concern themselves in the subject; and in 1908 there took place at Salzburg a first meeting of adherents from a number of different countries. In 1909 Freud and Jung were invited to America by G. Stanley Hall to deliver a series of lectures on psycho-analysis at Clark University, Worcester, Mass. From that time forward interest grew rapidly in Europe; it expressed itself, however, in a very forcible rejection of the new teachings - a rejection which often showed an unscientific colouring.

The reasons for this hostility were to be found, from the medical point of view, in the fact that psycho-analysis lays stress upon psychical factors, and from the philosophical point of view, in its assuming as an underlying postulate the concept of unconscious mental activity; but the strongest reason was undoubtedly the general disinclination of mankind to concede to the factor of sexuality the importance that is assigned to it by psycho-analysis. In spite of this widespread opposition, however, the movement in favour of psycho-analysis was not to be checked. Its adherents formed themselves into an International Association, which passed successfully through the ordeal of the World War, and at the present time (1925) comprises local groups in Vienna, Berlin, Budapest, London, Switzerland, Holland, Moscow and Calcutta, as well as two in the United States. There are three periodicals representing the views of these societies: the *Internationale Zeitschrift für Psychoanalyse*, *Imago* (which is concerned with the application of psycho-analysis to non-medical fields of knowledge), and the *International Journal of Psycho-Analysis*.

During the years 1911-13 two former adherents, Alfred Adler, of Vienna, and C. G. Jung, of Zurich, seceded from the psycho-analytic movement and founded schools of thought of their own, which, in view of the general hostility to psycho-analysis, could be certain of a favourable reception, but which remained scientifically sterile. In 1921 Dr. M. Eitingon founded in Berlin the first public psycho-analytic clinic and training-school, and this was soon followed by a second in Vienna.

BIBLIOGRAPHY

Breuer and Freud, *Studies on Hysteria* (1895d); Freud, *Traumdeutung* (1900); *Zur Psychopathologie des Alltagslebens* (1904); *Drei Abhandlungen zur Sexualtheorie* (1905); *Vorlesungen zur Einführung in die Psychoanalyse* (1916). Freud's complete works have been published in German (Gesammelte Schriften) (1925), and in Spanish (*Obras completas*) (1923); the greater part of them has been translated into English and other languages. Short accounts of the subject-matter and history of psycho-analysis will be found in: Freud, *Über Psychoanalyse* (the lectures delivered at Worcester, U.S.A.) (1909); *Zur Geschichte der psychoanalytischen Bewegung* (1914); *Selbstdarstellung* (in Grote's collection *Die Medizin der Gegenwart in Selbstdarstellungen*) (1925). Particularly accessible to English readers are: Ernest Jones, *Papers on Psycho-Analysis*, and A. A. Brill, *Psychoanalysis*.

ADDRESS TO THE SOCIETY OF B'NAI B'RITH
(1941 [1926])

Intentionally left blank

ADDRESS TO THE SOCIETY OF B'NAI B'RITH

Most honourable Grand President, honourable Presidents, dear Brethren,-

I thank you for the honours you have paid me to-day. You know why it is that you cannot hear the sound of my own voice. You have heard one of my friends and pupils speak of my scientific work; but a judgement on such things is hard to form and for a long while yet it may not be reached with any certainty. Allow me to add something to what has been said by one who is both my friend and the physician who cares for me. I should like to tell you shortly how I became a B.B. and what I have looked for from you.

It happened that in the years from 1895 onwards I was subjected to two powerful impressions which combined to produce the same effect on me. On the one hand, I had gained my first insight into the depths of the life of the human instincts; I had seen some things that were sobering and even, at first, frightening. On the other hand, the announcement of my unpleasing discoveries had as its result the severance of the greater part of my human contacts; I felt as though I were despised and universally shunned. In my loneliness I was seized with a longing to find a circle of picked men of high character who would receive me in a friendly spirit in spite of my temerity. Your society was pointed out to me as the place where such men were to be found.

That you were Jews could only be agreeable to me; for I was myself a Jew, and it had always seemed to me not only unworthy but positively senseless to deny the fact. What bound me to Jewry was (I am ashamed to admit) neither faith nor national pride, for I have always been an unbeliever and was brought up without any religion though not without a respect for what are called the 'ethical' standards of human civilization. Whenever I felt an inclination to national enthusiasm I strove to suppress it as being harmful and wrong, alarmed by the warning examples of the peoples among whom we Jews live. But plenty of other things remained over to make the attraction of Jewry and Jews irresistible - many obscure emotional forces, which were the more powerful the less they could be expressed in words, as well as a clear consciousness of inner identity, the safe privacy of a common mental construction. And beyond this there was a perception that it was to my Jewish nature alone that I owed two characteristics that had become indispensable to me in the difficult course of my life. Because I was a Jew I found myself free from many prejudices which restricted others in the use of their intellect; and as a Jew I was prepared to join the Opposition and to do without agreement with the 'compact majority'.

So it was that I became one of you, took my share in your humanitarian and national interests, gained friends among you and persuaded my own few remaining friends to join our society. There was no question whatever of my convincing you of my new theories; but at a time when no one in Europe listened to me and I still had no disciples even in Vienna, you gave me your kindly attention. You were my first audience.

For some two thirds of the long period that has elapsed since my entry I persisted with you conscientiously, and found refreshment and stimulation in my relations with you. You have been kind enough to-day not to hold it up against me that during the last third of the time I have kept away from you. I was overwhelmed with work, and demands connected with it forced themselves on me; the day ceased to be long enough for me to attend your meetings, and soon my body began to rebel against a late evening meal. Finally came the years of my illness, which prevents me from being with you even to-day.

I cannot tell whether I have been a genuine B.B. in your sense. I am almost inclined to doubt it; so many exceptional circumstances have arisen in my case. But of this I can assure you - that you meant much to me and did much for me during the years in which I belonged to you. I ask you therefore to accept my warmest thanks both for those years and for to-day.

Yours in W. B. & E
Sigm. Freud

KARL ABRAHAM
(1926)

Dr. Karl Abraham, President of the Berlin group, of which he was the founder, and President at the time of the International Psycho-Analytical Association, died in Berlin on December 25. He had not reached the age of fifty when he succumbed to an internal complaint against which his powerful physique had had to contend ever since the spring. At the Homburg Congress he had seemed, to the great joy of us all, to have recovered; but a relapse brought us painful disappointment.

We bury with him - *integer vitae scerisque purus* - one of the firmest hopes of our science, young as it is and still so bitterly assailed, and a part of its future that is now, perhaps, unrealizable. Among all those who followed me along the dark paths of psycho-analytic research, he won so pre-eminent a place that only one other name could be set beside his. It is likely that the boundless trust of his colleagues and pupils would have called him to the leadership; and he would without doubt have been a model leader in the pursuit of truth, led astray neither by the praise or blame of the many nor by the seductive illusion of his own phantasies.

I write these lines for friends and fellow-workers who knew and valued Abraham as I did. They will find it easy to understand what the loss of this friend, so much younger than I am, means to me; and they will forgive me if I make no further attempt to express what it is so hard to put into words. An account of Abraham's scientific personality and an appreciation of his work will be undertaken for our journal by another hand.

TO ROMAIN ROLLAND
(1926)

Unforgettable one! By what troubles and sufferings must you have fought your way up to such a height of humanity as yours!

Long years before I saw you, I had honoured you as an artist and as an apostle of the love of mankind. I was myself a disciple of the love of mankind, not from sentimental motives or in pursuit of an ideal, but for sober, economic reasons, because, our inborn instincts and the world around us being what they are, I could not but regard that love as no less essential for the survival of the human race than such things as technology.

And when at last I came to know you personally, I was surprised to find that you can value strength and energy so highly and that you yourself embody such force of will.

May the next decade bring you nothing but fulfilments!

Most cordially yours

Sigm. Freud, aetat. 70.

PREFATORY NOTE TO A PAPER BY E. PICKWORTH FARROW
(1926)

The author of this paper is known to me as a man of strong and independent intelligence. Probably through being somewhat self-willed he failed to get on to good terms with two analysts with whom he made the attempt. He thereupon proceeded to make a systematic application of the procedure of self-analysis which I myself employed in the past for the analysis of my own dreams. His findings deserve attention precisely on account of the peculiar character of his personality and of his technique.

THE FUTURE OF AN ILLUSION
(1927)

Intentionally left blank

THE FUTURE OF AN ILLUSION

I

When one has lived for quite a long time in a particular civilization and has often tried to discover what its origins were and along what path it has developed, one sometimes also feels tempted to take a glance in the other direction and to ask what further fate lies before it and what transformations it is destined to undergo. But one soon finds that the value of such an enquiry is diminished from the outset by several factors. Above all, because there are only a few people who can survey human activity in its full compass. Most people have been obliged to restrict themselves to a single, or a few, fields of it. But the less a man knows about the past and the present the more insecure must prove to be his judgement of the future. And there is the further difficulty that precisely in a judgement of this kind the subjective expectations of the individual play a part which it is difficult to assess; and these turn out to be dependent on purely personal factors in his own experience, on the greater or lesser optimism of his attitude to life, as it has been dictated for him by his temperament or by his success or failure. Finally, the curious fact makes itself felt that in general people experience their present naïvely, as it were, without being able to form an estimate of its contents; they have first to put themselves at a distance from it - the present, that is to say, must have become the past - before it can yield points of vantage from which to judge the future.

Thus anyone who gives way to the temptation to deliver an opinion on the probable future of our civilization will do well to remind himself of the difficulties I have just pointed out, as well as of the uncertainty that attaches quite generally to any prophecy. It follows from this, so far as I am concerned, that I shall make a hasty retreat before a task that is too great, and shall promptly seek out the small tract of territory which has claimed my attention hitherto, as soon as I have determined its position in the general scheme of things.

Human civilization, by which I mean all those respects in which human life has raised itself above its animal status and differs from the life of beasts - and I scorn to distinguish between culture and civilization - , presents, as we know, two aspects to the observer. It includes on the one hand all the knowledge and capacity that men have acquired in order to control the forces of nature and extract its wealth for the satisfaction of human needs, and, on the other hand, all the regulations necessary in order to adjust the relations of men to one another and especially the distribution of the available wealth. The two trends of civilization are not independent of each other: firstly, because the mutual relations of men are profoundly influenced by the amount of instinctual satisfaction which the existing wealth makes possible; secondly, because an individual man can himself come to function as wealth in relation to another one, in so far as the other person makes use of his capacity for work, or chooses him as a sexual object; and thirdly, moreover, because every individual is virtually an enemy of civilization, though civilization is supposed to be an object of universal human interest. It is remarkable that, little as men are able to exist in isolation, they should nevertheless feel as a heavy burden the sacrifices which civilization expects of them in order to make a communal life possible. Thus civilization has to be defended against the individual, and its regulations, institutions and commands are directed to that task. They aim not only at effecting a certain distribution of wealth but at maintaining that distribution; indeed, they have to protect everything that contributes to the conquest of nature and the production of wealth against men's hostile impulses. Human creations are easily destroyed, and science and technology, which have built them up, can also be used for their annihilation.

One thus gets an impression that civilization is something which was imposed on a resisting majority by a minority which understood how to obtain possession of the means to power and coercion. It is, of course, natural to assume that these difficulties are not inherent in the nature of civilization itself but are determined by the imperfections of the cultural forms which have so far been developed. And in fact it is not difficult to indicate those defects. While mankind has made continual advances in its control over nature and may expect to make still greater ones, it is not possible to establish with certainty that a similar advance has been made in the management of human affairs; and probably at all periods, just as now once again, many people have asked themselves whether what little civilization has thus acquired is indeed worth defending at all. One would think that a re-ordering of human relations should be possible, which would remove the sources of dissatisfaction with civilization by renouncing coercion and the suppression of the instincts, so that, undisturbed by internal discord, men might devote themselves to the acquisition of wealth and its enjoyment. That would be the golden age, but it is questionable if such a state of affairs can be realized. It seems rather that every civilization must be built up on coercion and renunciation of instinct; it does not even seem certain that if coercion were to cease the majority of human beings would be prepared to undertake to perform the work necessary for acquiring new wealth. One has, I think, to reckon with the fact that there are present in all men destructive, and therefore anti-social and anti-cultural, trends and that in a great number of people these are strong enough to determine their behaviour in human society.

This psychological fact has a decisive importance for our judgement of human civilization. Whereas we might at first think that its essence lies in controlling nature for the purpose of acquiring wealth and that the dangers which threaten it could be eliminated through a suitable distribution of that wealth among men, it now seems that the emphasis has moved over from the material to the mental. The decisive question is whether and to what extent it is possible to lessen the burden of the instinctual sacrifices imposed on men, to reconcile men to those which must necessarily remain and to provide a compensation for them. It is just as impossible to do without control of the mass by a minority as it is to dispense with coercion in the work of civilization. For masses are lazy and unintelligent; they have no love for instinctual renunciation, and they are not to be convinced by argument of its inevitability; and the individuals composing them support one another in giving free rein to their indiscipline. It is only through the influence of individuals who can set an example and whom masses recognize as their leaders that they can be induced to perform the work and undergo the renunciations on which the existence of civilization depends. All is well if these leaders are persons who possess superior insight into the necessities of life and who have risen to the height of mastering their own instinctual wishes. But there is a danger that in order not to lose their influence they may give way to the mass more than it gives way to them, and it therefore seems necessary that they shall be independent of the mass by having means to power at their disposal. To put it briefly, there are two widespread human characteristics which are responsible for the fact that the regulations of civilization can only be maintained by a certain degree of coercion - namely, that men are not spontaneously fond of work and that arguments are of no avail against their passions.

I know the objections which will be raised against these assertions. It will be said that the characteristic of human masses depicted here, which is supposed to prove that coercion cannot be dispensed with in the work of civilization, is itself only the result of defects in the cultural regulations, owing to which men have become embittered, revengeful and inaccessible. New generations, who have been brought up in kindness and taught to have a high opinion of reason, and who have experienced the benefits of civilization at an early age, will have a different attitude to it. They will feel it as a possession of their very own and will be ready for its sake to make the sacrifices as regards work and instinctual satisfaction that are necessary for its preservation. They will be able to do without coercion and will differ little from their leaders. If no culture has so far produced human masses of such a quality, it is because no culture has yet devised regulations which will influence men in this way, and in particular from childhood onwards.

It may be doubted whether it is possible at all, or at any rate as yet, at the present stage of our control over nature, to set up cultural regulations of this kind. It may be asked where the number of superior, unswerving and disinterested leaders are to come from who are to act as educators of the future generations, and it may be alarming to think of the enormous amount of coercion that will inevitably be required before these intentions can be carried out. The grandeur of the plan and its importance for the future of human civilization cannot be disputed. It is securely based on the psychological discovery that man is equipped with the most varied instinctual dispositions, whose ultimate course is determined by the experiences of early childhood. But for the same reason the limitations of man's capacity for education set bounds to the effectiveness of such a transformation in his culture. One may question whether, and in what degree, it would be possible for a different cultural environment to do away with the two characteristics of human masses which make the guidance of human affairs so difficult. The experiment has not yet been made. Probably a certain percentage of mankind (owing to a pathological disposition or an excess of instinctual strength) will always remain asocial; but if it were feasible merely to reduce the majority that is hostile towards civilization to-day into a minority, a great deal would have been accomplished - perhaps all that *can* be accomplished.

I should not like to give the impression that I have strayed a long way from the line laid down for my enquiry. Let me therefore give an express assurance that I have not the least intention of making judgements on the great experiment in civilization that is now in progress in the vast country that stretches between Europe and Asia. I have neither the special knowledge nor the capacity to decide on its practicability, to test the expediency of the methods employed or to measure the width of the inevitable gap between intention and execution. What is in preparation there is unfinished and therefore eludes an investigation for which our own long-consolidated civilization affords us material.

II

We have slipped unawares out of the economic field into the field of psychology. At first we were tempted to look for the assets of civilization in the available wealth and in the regulations for its distribution. But with the recognition that every civilization rests on a compulsion to work and a renunciation of instinct and therefore inevitably provokes opposition from those affected by these demands, it has become clear that civilization cannot consist principally or solely in wealth itself and the means of acquiring it and the arrangements for its distribution; for these things are threatened by the rebelliousness and destructive mania of the participants in civilization. Alongside of wealth we now come upon the means by which civilization can be defended - measures of coercion and other measures that are intended to reconcile men to it and to recompense them for their sacrifices. These latter may be described as the mental assets of civilization.

For the sake of a uniform terminology we will describe the fact that an instinct cannot be satisfied as a 'frustration', the regulation by which this frustration is established as a 'prohibition' and the condition which is produced by the prohibition as a 'privation'. The first step is to distinguish between privations which affect everyone and privations which do not affect everyone but only groups, classes or even single individuals. The former are the earliest; with the prohibitions that established them, civilization - who knows how many thousands of years ago? - began to detach man from his primordial animal condition. We have found to our surprise that these privations are still operative and still form the kernel of hostility to civilization. The instinctual wishes that suffer under them are born afresh with every child; there is a class of people, the neurotics, who already react to these frustrations with asocial behaviour. Among these instinctual wishes are those of incest, cannibalism and lust for killing. It sounds strange to place alongside one another wishes which everyone seems united in repudiating and others about which there is so much lively dispute in our civilization as to whether they shall be permitted or frustrated; but psychologically it is justifiable to do so. Nor is the attitude of civilization to these oldest instinctual wishes by any means uniform. Cannibalism alone seems to be universally proscribed and - to the non-psycho-analytic view - to have been completely surmounted. The strength of the incestuous wishes can still be detected behind the prohibition against them; and under certain conditions killing is still practised, and indeed commanded, by our civilization. It is possible that cultural developments lie ahead of us in which the satisfaction of yet other wishes, which are entirely permissible to-day, will appear just as unacceptable as cannibalism does now.

These earliest instinctual renunciations already involve a psychological factor which remains important for all further instinctual renunciations as well. It is not true that the human mind has undergone no development since the earliest times and that, in contrast to the advances of science and technology, it is the same to-day as it was at the beginning of history. We can point out one of these mental advances at once. It is in keeping with the course of human development that external coercion gradually becomes internalized; for a special mental agency, man's super-ego, takes it over and includes it among its commandments. Every child presents this process of transformation to us; only by that means does it become a moral and social being. Such a strengthening of the super-ego is a most precious cultural asset in the psychological field. Those in whom it has taken place are turned from being opponents of civilization into being its vehicles. The greater their number is in a cultural unit the more secure is its culture and the more it can dispense with external measures of coercion. Now the degree of this internalization differs greatly between the various instinctual prohibitions. As regards the earliest cultural demands, which I have mentioned, the internalization seems to have been very extensively achieved, if we leave out of account the unwelcome exception of the neurotics. But the case is altered when we turn to the other instinctual claims. Here we observe with surprise and concern that a majority of people obey the cultural prohibitions on these points only under the pressure of external coercion - that is, only where that coercion can make itself effective and so long as it is to be feared. This is also true of what are known as the *moral* demands of civilization, which likewise apply to everyone. Most of one's experiences of man's moral untrustworthiness fall into this category. There are countless civilized people who would shrink from murder or incest but who do not deny themselves the satisfaction of their avarice, their aggressive urges or their sexual lusts, and who do not hesitate to injure other people by lies, fraud and calumny, so long as they can remain unpunished for it; and this, no doubt, has always been so though many ages of civilization.

If we turn to those restrictions that apply only to certain classes of society, we meet with a state of things which is flagrant and which has always been recognized. It is to be expected that these underprivileged classes will envy the favoured ones their privileges and will do all they can to free themselves from their own surplus of privation. Where this is not possible, a permanent measure of discontent will persist within the culture concerned and this can lead to dangerous revolts. If, however, a culture has not got beyond a point at which the satisfaction of one portion of its participants depends upon the suppression of another, and perhaps larger, portion - and this is the case in all present day cultures - it is understandable that the suppressed people should develop an intense hostility towards a culture whose existence they make possible by their work, but in whose wealth they have too small a share. In such conditions an internalization of the cultural prohibitions among the suppressed people is not to be expected. On the contrary, they are not prepared to acknowledge the prohibitions, they are intent on destroying the culture itself, and possibly even on doing away with the postulates on which it is based. The hostility of these classes to civilization is so obvious that it has caused the more latent hostility of the social strata that are better provided for to be overlooked. It goes without saying that a civilization which leaves so large a number of its participants unsatisfied and drives them into revolt neither has nor deserves the prospect of a lasting existence.

The extent to which a civilization's precepts have been internalized - to express it popularly and unpsychologically: the moral level of its participants - is not the only form of mental wealth that comes into consideration in estimating a civilization's value. There are in addition its assets in the shape of ideals and artistic creations - that is, the satisfactions that can be derived from those sources.

People will be only too readily inclined to include among the psychical assets of a culture its ideals - its estimates of what achievements are the highest and the most to be striven after. It will seem at first as though these ideals would determine the achievements of the cultural unit; but the actual course of events would appear to be that the ideals are based on the first achievements which have been made possible by a combination of the culture's internal gifts and external circumstances, and that these first achievements are then held on to by the ideal as something to be carried further. The satisfaction which the ideal offers to the participants in the culture is thus of a narcissistic nature; it rests on their pride in what has already been successfully achieved. To make this satisfaction complete calls for a comparison with other cultures which have aimed at different achievements and have developed different ideals. On the strength of these differences every culture claims the right to look down on the rest. In this way cultural ideals become a source of discord and enmity between different cultural units, as can be seen most clearly in the case of nations.

The narcissistic satisfaction provided by the cultural ideal is also among the forces which are successful in combating the hostility to culture within the cultural unit. This satisfaction can be shared in not only by the favoured classes, which enjoy the benefits of the culture, but also by the suppressed ones, since the right to despise the people outside it compensates them for the wrongs they suffer within their own unit. No doubt one is a wretched plebeian, harassed by debts and military service; but, to make up for it, one is a Roman citizen, one has one's share in the task of ruling other nations and dictating their laws. This identification of the suppressed classes with the class who rules and exploits them is, however, only part of a larger whole. For, on the other hand, the suppressed classes can be emotionally attached to their masters; in spite of their hostility to them they may see in them their ideals; unless such relations of a fundamentally satisfying kind subsisted, it would be impossible to understand how a number of civilizations have survived so long in spite of the justifiable hostility of large human masses.

A different kind of satisfaction is afforded by art to the participants in a cultural unit, though as a rule it remains inaccessible to the masses, who are engaged in exhausting work and have not enjoyed any personal education. As we discovered long since, art offers substitutive satisfactions for the oldest and still most deeply felt cultural renunciations, and for that reason it serves as nothing else does to reconcile a man to the sacrifices he has made on behalf of civilization. On the other hand, the creations of art heighten his feelings of identification, of which every cultural unit stands in so much need, by providing an occasion for sharing highly valued emotional experiences. And when those creations picture the achievements of his particular culture and bring to his mind its ideals in an impressive manner, they also minister to his narcissistic satisfaction.

No mention has yet been made of what is perhaps the most important item in the psychical inventory of a civilization. This consists in its religious ideas in the widest sense - in other words (which will be justified later) in its illusions.

III

In what does the peculiar value of religious ideas lie?

We have spoken of the hostility to civilization which is produced by the pressure that civilization exercises, the renunciations of instinct which it demands. If one imagines its prohibitions lifted - if, then, one may take any woman one pleases as a sexual object, if one may without hesitation kill one's rival for her love or anyone else who stands in one's way, if, too, one can carry off any of the other man's belongings without asking leave - how splendid, what a string of satisfactions one's life would be! True, one soon comes across the first difficulty: everyone else has exactly the same wishes as I have and will treat me with no more consideration than I treat him. And so in reality only one person could be made unrestrictedly happy by such a removal of the restrictions of civilization, and he would be a tyrant, a dictator, who had seized all the means to power. And even he would have every reason to wish that the others would observe at least one cultural commandment: 'thou shalt not kill'.

But how ungrateful, how short-sighted after all, to strive for the abolition of civilization! What would then remain would be a state of nature, and that would be far harder to bear. It is true that nature would not demand any restrictions of instinct from us, she would let us do as we liked; but she has her own particularly effective method of restricting us. She destroys us coldly, cruelly, relentlessly, as it seems to us, and possibly through the very things that occasioned our satisfaction. It was precisely because of these dangers with which nature threatens us that we came together and created civilization, which is also, among other things, intended to make our communal life possible. For the principal task of civilization, its actual *raison d'être*, is to defend us against nature.

We all know that in many ways civilization does this fairly well already, and clearly as time goes on it will do it much better. But no one is under the illusion that nature has already been vanquished; and few dare hope that she will ever be entirely subjected to man. There are the elements, which seem to mock at all human control: the earth, which quakes and is torn apart and buries all human life and its works; water, which deluges and drowns everything in a turmoil; storms, which blow everything before them; there are diseases, which we have only recently recognized as attacks by other organisms; and finally there is the painful riddle of death, against which no medicine has yet been found, nor probably will be. With these forces nature rises up against us, majestic, cruel and inexorable; she brings to our mind once more our weakness and helplessness, which we thought to escape through the work of civilization. One of the few gratifying and exalting impressions which mankind can offer is when, in the face of an elemental catastrophe, it forgets the discordancies of its civilization and all its internal difficulties and animosities, and recalls the great common task of preserving itself against the superior power of nature.

For the individual, too, life is hard to bear, just as it is for mankind in general. The civilization in which he participates imposes some amount of privation on him, and other men bring him a measure of suffering, either in spite of the precepts of his civilization or because of its imperfections. To this are added the injuries which untamed nature - he calls it Fate - inflicts on him. One might suppose that this condition of things would result in a permanent state of anxious expectation in him and a severe injury to his natural narcissism. We know already how the individual reacts to the injuries which civilization and other men inflict on him: he develops a corresponding degree of resistance to the regulations of civilization and of hostility to it. But how does he defend himself against the superior powers of nature, of Fate, which threaten him as they threaten all the rest?

Civilization relieves him of this task; it performs it in the same way for all alike; and it is noteworthy that in this almost all civilizations act alike. Civilization does not call a halt in the task of defending man against nature, it merely pursues it by other means. The task is a manifold one. Man's self-regard, seriously menaced, calls for consolation; life and the universe must be robbed of their terrors; moreover his curiosity, moved, it is true, by the strongest practical interest, demands an answer.

A great deal is already gained with the first step: the humanization of nature. Impersonal forces and destinies cannot be approached; they remain eternally remote. But if the elements have passions that rage as they do in our own souls, if death itself is not something spontaneous but the violent act of an evil Will, if everywhere in nature there are Beings around us of a kind that we know in our own society, then we can breathe freely, can feel at home in the uncanny and can deal by psychical means with our senseless anxiety. We are still defenceless, perhaps, but we are no longer helplessly paralysed; we can at least react. Perhaps, indeed, we are not even defenceless. We can apply the same methods against these violent supermen outside that we employ in our own society; we can try to adjure them, to appease them, to bribe them, and, by so influencing them, we may rob them of a part of their power. A replacement like this of natural science by psychology not only provides immediate relief, but also points the way to a further mastering of the situation.

For this situation is nothing new. It has an infantile prototype, of which it is in fact only the continuation. For once before one has found oneself in a similar state of helplessness: as a small child, in relation to one's parents. One had reason to fear them, and especially one's father; and yet one was sure of his protection against the dangers one knew. Thus it was natural to assimilate the two situations. Here, too, wishing played its part, as it does in dream-life. The sleeper may be seized with a presentiment of death, which threatens to place him in the grave. But the dream-work knows how to select a condition that will turn even that dreaded event into a wish-fulfilment: the dreamer sees himself in an ancient Etruscan grave which he has climbed down into, happy to find his archaeological interests satisfied. In the same way, a man makes the forces of nature not simply into persons with whom he can associate as he would with his equals - that would not do justice to the overpowering impression which those forces make on him - but he gives them the character of a father. He turns them into gods, following in this, as I have tried to show, not only an infantile prototype but a phylogenetic one.

In the course of time the first observations were made of regularity and conformity to law in natural phenomena, and with this the forces of nature lost their human traits. But man's helplessness remains and along with it his longing for his father, and the gods. The gods retain their threefold task: they must exorcize the terrors of nature, they must reconcile men to the cruelty of Fate, particularly as it is shown in death, and they must compensate them for the sufferings and privations which a civilized life in common has imposed on them.

But within these functions there is a gradual displacement of accent. It was observed that the phenomena of nature developed automatically according to internal necessities. Without doubt the gods were the lords of nature; they had arranged it to be as it was and now they could leave it to itself. Only occasionally, in what are known as miracles, did they intervene in its course, as though to make it plain that they had relinquished nothing of their original sphere of power. As regards the apportioning of destinies, an unpleasant suspicion persisted that the perplexity and helplessness of the human race could not be remedied. It was here that the gods were most apt to fail. If they themselves created Fate, then their counsels must be deemed inscrutable. The notion dawned on the most gifted people of antiquity that Moira stood above the gods and that the gods themselves had their own destinies. And the more autonomous nature became and the more the gods withdrew from it, the more earnestly were all expectations directed to the third function of the gods - the more did morality become their true domain. It now became the task of the gods to even out the defects and evils of civilization, to attend to the sufferings which men inflict on one another in their life together and to watch over the fulfilment of the precepts of civilization, which men obey so imperfectly. Those precepts themselves were credited with a divine origin; they were elevated beyond human society and were extended to nature and the universe.

And thus a store of ideas is created, born from man's need to make his helplessness tolerable and built up from the material of memories of the helplessness of his own childhood and the childhood of the human race. It can clearly be seen that the possession of these ideas protects him in two directions - against the dangers of nature and Fate, and against the injuries that threaten him from human society itself. Here is the gist of the matter. Life in this world serves a higher purpose; no doubt it is not easy to guess what that purpose is, but it certainly signifies a perfecting of man's nature. It is probably the spiritual part of man, the soul, which in the course of time has so slowly and unwillingly detached itself from the body, that is the object of this elevation and exaltation. Everything that happens in this world is an expression of the intentions of an intelligence superior to us, which in the end, though its ways and byways are difficult to follow, orders everything for the best - that is, to make it enjoyable for us. Over each one of us there watches a benevolent Providence which is only seemingly stern and which will not suffer us to become a plaything of the overmighty and pitiless forces of nature. Death itself is not extinction, is not a return to inorganic lifelessness, but the beginning of a new kind of existence which lies on the path of development to something higher. And, looking in the other direction, this view announces that the same moral laws which our civilizations have set up govern the whole universe as well, except that they are maintained by a supreme court of justice with incomparably more power and consistency. In the end all good is rewarded and all evil punished, if not actually in this form of life then in the later existences that begin after death. In this way all the terrors, the sufferings and the hardships of life are destined to be obliterated. Life after death, which continues life on earth just as the invisible part of the spectrum joins on to the visible part, brings us all the perfection that we may perhaps have missed here. And the superior wisdom which directs this course of things, the infinite goodness that expresses itself in it, the justice that achieves its aim in it - these are the attributes of the divine beings who also created us and the world as a whole, or rather, of the one divine being into which, in our civilization, all the gods of antiquity have been condensed. The people which first succeeded in thus concentrating the divine attributes was not a little proud of the advance. It had laid open to view the father who had all along been hidden behind every divine figure as its nucleus. Fundamentally this was a return to the historical beginnings of the idea of God. Now that God was a single person, man's relations to him could recover the intimacy and intensity of the child's relation to his father. But if one had done so much for one's father, one wanted to have a reward, or at least to be his only beloved child, his Chosen People. Very much later, pious America laid claim to being 'God's own Country'; and, as regards one of the shapes in which men worship the deity, the claim is undoubtedly valid.

The religious ideas that have been summarized above have of course passed through a long process of development and have been adhered to in various phases by various civilizations. I have singled out one such phase, which roughly corresponds to the final form taken by our present-day white Christian civilization. It is easy to see that not all the parts of this picture tally equally well with one another, that not all the questions that press for an answer receive one, and that it is difficult to dismiss the contradiction of daily experience. Nevertheless, such as they are, those ideas - ideas which are religious in the widest sense - are prized as the most precious possession of civilization, as the most precious thing it has to offer its participants. It is far more highly prized than all the devices for winning treasures from the earth or providing men with sustenance or preventing their illnesses, and so forth. People feel that life would not be tolerable if they did not attach to these ideas the value that is claimed for them. And now the question arises: what are these ideas in the light of psychology? Whence do they derive the esteem in which they are held? And, to take a further timid step, what is their real worth?

IV

An enquiry which proceeds like a monologue, without interruption, is not altogether free from danger. One is too easily tempted into pushing aside thoughts which threaten to break into it, and in exchange one is left with a feeling of uncertainty which in the end one tries to keep down by over-decisiveness. I shall therefore imagine that I have an opponent who follows my arguments with mistrust, and here and there I shall allow him to interject some remarks.

I hear him say: 'You have repeatedly used the expressions "civilization creates these religious ideas", "civilization places them at the disposal of its participants". There is something about this that sounds strange to me. I cannot myself say why, but it does not sound so natural as it does to say that civilization has made rules about distributing the products of labour or about rights concerning women and children.'

I think, all the same, that I am justified in expressing myself in this way. I have tried to show that religious ideas have arisen from the same need as have all the other achievements of civilization: from the necessity of defending oneself against the crushingly superior force of nature. To this a second motive was added - the urge to rectify the shortcomings of civilization which made themselves painfully felt. Moreover, it is especially apposite to say that civilization gives the individual these ideas, for he finds them there already; they are presented to him ready-made, and he would not be able to discover them for himself. What he is entering into is the heritage of many generations, and he takes it over as he does the multiplication table, geometry, and similar things. There is indeed a difference in this, but that difference lies elsewhere and I cannot examine it yet. The feeling of strangeness that you mention may be partly due to the fact that this body of religious ideas is usually put forward as a divine revelation. But this presentation of it is itself a part of the religious system, and it entirely ignores the known historical development of these ideas and their differences in different epochs and civilizations.

'Here is another point, which seems to me to be more important. You argue that the humanization of nature is derived from the need to put an end to man's perplexity and helplessness in the face of its dreaded forces, to get into a relation with them and finally to influence them. But a motive of this kind seems superfluous. Primitive man has no choice, he has no other way of thinking. It is natural to him, something innate, as it were, to project his existence outwards into the world and to regard every event which he observes as the manifestation of beings who at bottom are like himself. It is his only method of comprehension. And it is by no means self-evident, on the contrary it is a remarkable coincidence, if by thus indulging his natural disposition he succeeds in satisfying one of his greatest needs.'

I do not find that so striking. Do you suppose that human thought has no practical motives, that it is simply the expression of a disinterested curiosity? That is surely very improbable. I believe rather that when man personifies the forces of nature he is again following an infantile model. He has learnt from the persons in his earliest environment that the way to influence them is to establish a relation with them; and so, later on, with the same end in view, he treats everything else that he comes across in the same way as he treated those persons. Thus I do not contradict your descriptive observation; it is in fact natural to man to personify everything that he wants to understand in order later to control it (psychical mastering as a preparation for physical mastering); but I provide in addition a motive and a genesis for this peculiarity of human thinking.

'And now here is yet a third point. You have dealt with the origin of religion once before, in your book *Totem and Taboo*. But there it appeared in a different light. Everything was the son-father relationship. God was the exalted father, and the longing for the father was the root of the need for religion. Since then, it seems, you have discovered the factor of human weakness and helplessness, to which indeed the chief role in the formation of religion is generally assigned, and now you transpose everything that was once the father complex into terms of helplessness. May I ask you to explain this transformation?'

With pleasure. I was only waiting for this invitation. But is it really a transformation? In *Totem and Taboo* it was not my purpose to explain the origin of religions but only of totemism. Can you, from any of the views known to you, explain the fact that the first shape in which the protecting deity revealed itself to men should have been that of an animal, that there was a prohibition against killing and eating this animal and that nevertheless the solemn custom was to kill and eat it communally once a year? This is precisely what happens in totemism. And it is hardly to the purpose to argue about whether totemism ought to be called a religion. It has intimate connections with the later god-religions. The totem animals become the sacred animals of the gods; and the earliest, but most fundamental moral restrictions - the prohibitions against murder and incest - originate in totemism. Whether or not you accept the conclusions of *Totem and Taboo*, I hope you will admit that a number of very remarkable, disconnected facts are brought together in it into a consistent whole.

The question of why in the long run the animal god did not suffice, and was replaced by a human one, was hardly touched on in *Totem and Taboo*, and other problems concerning the formation of religion were not mentioned in the book at all. Do you regard a limitation of that kind as the same thing as a denial? My work is a good example of the strict isolation of the particular contribution which psycho-analytic discussion can make to the solution of the problem of religion. If I am now trying to add the other, less deeply concealed part, you should not accuse me of contradicting myself, just as before you accused me of being one-sided. It is, of course, my duty to point out the connecting links between what I said earlier and what I put forward now, between the deeper and the manifest motives, between the father-complex and man's helplessness and need for protection.

These connections are not hard to find. They consist in the relation of the child's helplessness to the helplessness of the adult which continues it. So that, as was to be expected, the motives for the formation of religion which psycho-analysis revealed now turn out to be the same as the infantile contribution to the *manifest* motives. Let us transport ourselves into the mental life of a child. You remember the choice of object according to the anaclitic type, which psycho-analysis talks of? The libido there follows the paths of narcissistic needs and attaches itself to the objects which ensure the satisfaction of those needs. In this way the mother, who satisfies the child's hunger, becomes its first love-object and certainly also its first protection against all the undefined dangers which threaten it in the external world - its first protection against anxiety, we may say.

In this function the mother is soon replaced by the stronger father, who retains that position for the rest of childhood. But the child's attitude to its father is coloured by a peculiar ambivalence. The father himself constitutes a danger for the child, perhaps because of its earlier relation to its mother. Thus it fears him no less than it longs for him and admires him. The indications of this ambivalence in the attitude to the father are deeply imprinted in every religion, as was shown in *Totem and Taboo*. When the growing individual finds that he is destined to remain a child for ever, that he can never do without protection against strange superior powers, he lends those powers the features belonging to the figure of his father; he creates for himself the gods whom he dreads, whom he seeks to propitiate, and whom he nevertheless entrusts with his own protection. Thus his longing for a father is a motive identical with his need for protection against the consequences of his human weakness. The defence against childish helplessness is what lends its characteristic features to the adult's reaction to the helplessness which *he* has to acknowledge - a reaction which is precisely the formation of religion. But it is not my intention to enquire any further into the development of the idea of God; what we are concerned with here is the finished body of religious ideas as it is transmitted by civilization to the individual.

V

Let us now take up the thread of our enquiry. What, then, is the psychological significance of religious ideas and under what heading are we to classify them? The question is not at all easy to answer immediately. After rejecting a number of formulations, we will take our stand on the following one. Religious ideas are teachings and assertions about facts and conditions of external (or internal) reality which tell one something one has not discovered for oneself and which lay claim to one's belief. Since they give us information about what is most important and interesting to us in life, they are particularly highly prized. Anyone who knows nothing of them is very ignorant; and anyone who has added them to his knowledge may consider himself much the richer.

There are, of course, many such teachings about the most various things in the world. Every school lesson is full of them. Let us take geography. We are told that the town of Constance lies on the Bodensee. A student song adds: 'if you don't believe it, go and see.' I happen to have been there and can confirm the fact that that lovely town lies on the shore of a wide stretch of water which all those who live round it call the Bodensee; and I am now completely convinced of the correctness of this geographical assertion. In this connection I am reminded of another, very remarkable, experience. I was already a man of mature years when I stood for the first time on the hill of the Acropolis in Athens, between the temple ruins, looking out over the blue sea. A feeling of astonishment mingled with my joy. It seemed to say: 'So it really *is* true, just as we learnt at school!' How shallow and weak must have been the belief I then acquired in the real truth of what I heard, if I could be so astonished now! But I will not lay too much stress on the significance of this experience; for my astonishment could have had another explanation, which did not occur to me at the time and which is of a wholly subjective nature and has to do with the special character of the place.

All teachings like these, then, demand belief in their contents, but not without producing grounds for their claim. They are put forward as the epitomized result of a longer process of thought based on observation and certainly also on inferences. If anyone wants to go through this process himself instead of accepting its result, they show him how to set about it. Moreover, we are always in addition given the source of the knowledge conveyed by them, where that source is not self-evident, as it is in the case of geographical assertions. For instance, the earth is shaped like a sphere; the proofs adduced for this are Foucault's pendulum experiment, the behaviour of the horizon and the possibility of circumnavigating the earth. Since it is impracticable, as everyone concerned realizes, to send every schoolchild on a voyage round the world, we are satisfied with letting what is taught at school be taken on trust; but we know that the path to acquiring a personal conviction remains open.

Let us try to apply the same test to the teachings of religion. When we ask on what their claim to be believed is founded, we are met with three answers, which harmonize remarkably badly with one another. Firstly, these teachings deserve to be believed because they were already believed by our primal ancestors; secondly, we possess proofs which have been handed down to us from those same primaeval times; and thirdly, it is forbidden to raise the question of their authentication at all. In former days anything so presumptuous was visited with the severest penalties, and even to-day society looks askance at any attempt to raise the question again.

This third point is bound to rouse our strongest suspicions. After all, a prohibition like this can only be for one reason - that society is very well aware of the insecurity of the claim it makes on behalf of its religious doctrines. Otherwise it would certainly be very ready to put the necessary data at the disposal of anyone who wanted to arrive at conviction. This being so, it is with a feeling of mistrust which it is hard to allay that we pass on to an examination of the other two grounds of proof. We ought to believe because our forefathers believed. But these ancestors of ours were far more ignorant than we are. They believed in things we could not possibly accept to-day; and the possibility occurs to us that the doctrines of religion may belong to that class too. The proofs they have left us are set down in writings which themselves bear every mark of untrustworthiness. They are full of contradictions, revisions and falsifications, and where they speak of factual confirmations they are themselves unconfirmed. It does not help much to have it asserted that their wording, or even their content only, originates from divine revelation; for this assertion is itself one of the doctrines whose authenticity is under examination, and no proposition can be a proof of itself.

Thus we arrive at the singular conclusion that of all the information provided by our cultural assets it is precisely the elements which might be of the greatest importance to us and which have the task of solving the riddles of the universe and of reconciling us to the sufferings of life - it is precisely those elements that are the least well authenticated of any. We should not be able to bring ourselves to accept anything of so little concern to us as the fact that whales bear young instead of laying eggs, if it were not capable of better proof than this.

This state of affairs is in itself a very remarkable psychological problem. And let no one suppose that what I have said about the impossibility of proving the truth of religious doctrines contains anything new. It has been felt at all times - undoubtedly, too, by the ancestors who bequeathed us this legacy. Many of them probably nourished the same doubts as ours, but the pressure imposed on them was too strong for them to have dared to utter them. And since then countless people have been tormented by similar doubts, and have striven to suppress them, because they thought it was their duty to believe; many brilliant intellects have broken down over this conflict, and many characters have been impaired by the compromises with which they have tried to find a way out of it.

If all the evidence put forward for the authenticity of religious teachings originates in the past, it is natural to look round and see whether the present, about which it is easier to form judgements, may not also be able to furnish evidence of the sort. If by this means we could succeed in clearing even a single portion of the religious system from doubt, the whole of it would gain enormously in credibility. The proceedings of the spiritualists meet us at this point; they are convinced of the survival of the individual soul and they seek to demonstrate to us beyond doubt the truth of this one religious doctrine. Unfortunately they cannot succeed in refuting the fact that the appearance and utterances of their spirits are merely the products of their own mental activity. They have called up the spirits of the greatest men and of the most eminent thinkers, but all the pronouncements and information which they have received from them have been so foolish and so wretchedly meaningless that one can find nothing credible in them but the capacity of the spirits to adapt themselves to the circle of people who have conjured them up.

I must now mention two attempts that have been made - both of which convey the impression of being desperate efforts - to evade the problem. One, of a violent nature, is ancient; the other is subtle and modern. The first is the '*Credo quia absurdum*' of the early Father of the Church. It maintains that religious doctrines are outside the jurisdiction of reason - are above reason. Their truth must be felt inwardly, and they need not be comprehended. But this *Credo* is only of interest as a self-confession. As an authoritative statement it has no binding force. Am I to be obliged to believe *every* absurdity? And if not, why this one in particular? There is no appeal to a court above that of reason. If the truth of religious doctrines is dependent on an inner experience which bears witness to that truth, what is one to do about the many people who do not have this rare experience? One may require every man to use the gift of reason which he possesses, but one cannot erect, on the basis of a motive that exists only for a very few, an obligation that shall apply to everyone. If one man has gained an unshakable conviction of the true reality of religious doctrines from a state of ecstasy which has deeply moved him, of what significance is that to others?

The second attempt is the one made by the philosophy of 'As if'. This asserts that our thought-activity includes a great number of hypotheses whose groundlessness and even absurdity we fully realize. They are called 'fictions', but for a variety of practical reasons we have to behave 'as if' we believed in these fictions. This is the case with religious doctrines because of their incomparable importance for the maintenance of human society.¹ This line of argument is not far removed from the '*Credo quia absurdum*'. But I think the demand made by the 'As if' argument is one that only a philosopher could put forward. A man whose thinking is not influenced by the artifices of philosophy will never be able to accept it; in such a man's view, the admission that something is absurd or contrary to reason leaves no more to be said. It cannot be expected of him that precisely in treating his most important interests he shall forgo the guarantees he requires for all his ordinary activities. I am reminded of one of my children who was distinguished at an early age by a peculiarly marked matter-of-factness. When the children were being told a fairy story and were listening to it with rapt attention, he would come up and ask: 'Is that a true story?' When he was told it was not, he would turn away with a look of disdain. We may expect that people will soon behave in the same way towards the fairy tales of religion, in spite of the advocacy of 'As if'.

But at present they still behave quite differently; and in past times religious ideas, in spite of their incontrovertible lack of authentication, have exercised the strongest possible influence on mankind. This is a fresh psychological problem. We must ask where the inner force of those doctrines lies and to what it is that they owe their efficacy, independent as it is of recognition by reason.

¹ I hope I am not doing him an injustice if I take the philosopher of 'As if' as the representative of a view which is not foreign to other thinkers: 'We include as fictions not merely indifferent theoretical operations but ideational constructs emanating from the noblest minds, to which the noblest part of mankind cling and of which they will not allow themselves to be deprived. Nor is it our object so to deprive them - for as *practical fictions* we leave them all intact; they perish only as *theoretical truths*.' (Hans Vaihinger, 1922, 68.)

VI

I think we have prepared the way sufficiently for an answer to both these questions. It will be found if we turn our attention to the psychical origin of religious ideas. These, which are given out as teachings, are not precipitates of experience or end-results of thinking: they are illusions, fulfilments of the oldest, strongest and most urgent wishes of mankind. The secret of their strength lies in the strength of those wishes. As we already know, the terrifying impression of helplessness in childhood arouses the need for protection - for protection through love which was provided by the father; and the recognition that this helplessness lasts throughout life made it necessary to cling to the existence of a father, but this time a more powerful one. Thus the benevolent rule of a divine Providence allays our fear of the dangers of life; the establishment of a moral world-order ensures the fulfilment of the demands of justice, which have so often remained unfulfilled in human civilization; and the prolongation of earthly existence in a future life provides the local and temporal framework in which these wish-fulfilments shall take place. Answers to the riddles that tempt the curiosity of man, such as how the universe began or what the relation is between body and mind, are developed in conformity with the underlying assumptions of this system. It is an enormous relief to the individual psyche if the conflicts of its childhood arising from the father-complex - conflicts which it has never wholly overcome - are removed from it and brought to a solution which is universally accepted.

When I say that these things are all illusions, I must define the meaning of the word. An illusion is not the same thing as an error; nor is it necessarily an error. Aristotle's belief that vermin are developed out of dung (a belief to which ignorant people still cling) was an error; so was the belief of a former generation of doctors that *tabes dorsalis* is the result of sexual excess. It would be incorrect to call these errors illusions. On the other hand, it was an illusion of Columbus's that he had discovered a new sea-route to the Indies. The part played by his wish in this error is very clear. One may describe as an illusion the assertion made by certain nationalists that the Indo-Germanic race is the only one capable of civilization; or the belief, which was only destroyed by psycho-analysis, that children are creatures without sexuality. What is characteristic of illusions is that they are derived from human wishes. In this respect they come near to psychiatric delusions. But they differ from them, too, apart from the more complicated structure of delusions. In the case of delusions, we emphasize as essential their being in contradiction with reality. Illusions need not necessarily be false - that is to say, unrealizable or in contradiction to reality. For instance, a middle-class girl may have the illusion that a prince will come and marry her. This is possible; and a few such cases have occurred. That the Messiah will come and found a golden age is much less likely. Whether one classifies this belief as an illusion or as something analogous to a delusion will depend on one's personal attitude. Examples of illusions which have proved true are not easy to find, but the illusion of the alchemists that all metals can be turned into gold might be one of them. The wish to have a great deal of gold, as much gold as possible, has, it is true, been a good deal damped by our present-day knowledge of the determinants of wealth, but chemistry no longer regards the transmutation of metals into gold as impossible. Thus we call a belief an illusion when a wish-fulfilment is a prominent factor in its motivation, and in doing so we disregard its relations to reality, just as the illusion itself sets no store by verification.

Having thus taken our bearings, let us return once more to the question of religious doctrines. We can now repeat that all of them are illusions and insusceptible of proof. No one can be compelled to think them true, to believe in them. Some of them are so improbable, so incompatible with everything we have laboriously discovered about the reality of the world, that we may compare them - if we pay proper regard to the psychological differences - to delusions. Of the reality value of most of them we cannot judge; just as they cannot be proved, so they cannot be refuted. We still know too little to make a critical approach to them. The riddles of the universe reveal themselves only slowly to our investigation; there are many questions to which science to-day can give no answer. But scientific work is the only road which can lead us to a knowledge of reality outside ourselves. It is once again merely an illusion to expect anything from intuition and introspection; they can give us nothing but particulars about our own mental life, which are hard to interpret, never any information about the questions which religious doctrine finds it so easy to answer. It would be insolent to let one's own arbitrary will step into the breach and, according to one's personal estimate, declare this or that part of the religious system to be less or more acceptable. Such questions are too momentous for that; they might be called too sacred.

At this point one must expect to meet with an objection. 'Well then, if even obdurate sceptics admit that the assertions of religion cannot be refuted by reason, why should I not believe in them, since they have so much on their side - tradition, the agreement of mankind, and all the consolations they offer?' Why not, indeed? Just as no one can be forced to believe, so no one can be forced to disbelieve. But do not let us be satisfied with deceiving ourselves that arguments like these take us along the road of correct thinking. If ever there was a case of a lame excuse we have it here. Ignorance is ignorance; no right to believe anything can be derived from it. In other matters no sensible person will behave so irresponsibly or rest content with such feeble grounds for his opinions and for the one he takes. It is only in the highest and most sacred things that he allows himself to do so. In reality these are only attempts at pretending to oneself or to other people that one is still firmly attached to religion, when one has long since cut oneself loose from it. Where questions of religion are concerned, people are guilty of every possible sort of dishonesty and intellectual misdemeanour. Philosophers stretch the meaning of words until they retain scarcely anything of their original sense. They give the name of 'God' to some vague abstraction which they have created for themselves; having done so they can pose before all the world as deists, as believers in God, and they can even boast that they have recognized a higher, purer concept of God, notwithstanding that their God is now nothing more than an insubstantial shadow and no longer the mighty personality of religious doctrines. Critics persist in describing as 'deeply religious' anyone who admits to a sense of man's insignificance or impotence in the face of the universe, although what constitutes the essence of the religious attitude is not this feeling but only the next step after it, the reaction to it which seeks a remedy for it. The man who goes no further, but humbly acquiesces in the small part which human beings play in the great world - such a man is, on the contrary, irreligious in the truest sense of the word.

To assess the truth-value of religious doctrines does not lie within the scope of the present enquiry. It is enough for us that we have recognized them as being, in their psychological nature, illusions. But we do not have to conceal the fact that this discovery also strongly influences our attitude to the question which must appear to many to be the most important of all. We know approximately at what periods and by what kind of men religious doctrines were created. If in addition we discover the motives which led to this, our attitude to the problem of religion will undergo a marked displacement. We shall tell ourselves that it would be very nice if there were a God who created the world and was a benevolent Providence, and if there were a moral order in the universe and an after-life; but it is a very striking fact that all this is exactly as we are bound to wish it to be. And it would be more remarkable still if our wretched, ignorant and downtrodden ancestors had succeeded in solving all these difficult riddles of the universe.

VII

Having recognized religious doctrines as illusions, we are at once faced by a further question: may not other cultural assets of which we hold a high opinion and by which we let our lives be ruled be of a similar nature? Must not the assumptions that determine our political regulations be called illusions as well? and is it not the case that in our civilization the relations between the sexes are disturbed by an erotic illusion or a number of such illusions? And once our suspicion has been aroused, we shall not shrink from asking too whether our conviction that we can learn something about external reality through the use of observation and reasoning in scientific work - whether this conviction has any better foundation. Nothing ought to keep us from directing our observation to our own selves or from applying our thought to criticism of itself. In this field a number of investigations open out before us, whose results could not but be decisive for the construction of a '*Weltanschauung*'. We surmise, moreover, that such an effort would not be wasted and that it would at least in part justify our suspicion. But the author does not dispose of the means for undertaking so comprehensive a task; he needs must confine his work to following out one only of these illusions - that, namely, of religion.

But now the loud voice of our opponent brings us to a halt. We are called to account for our wrong-doing: 'Archaeological interests are no doubt most praiseworthy, but no one undertakes an excavation if by doing so he is going to undermine the habitations of the living so that they collapse and bury people under their ruins. The doctrines of religion are not a subject one can quibble about like any other. Our civilization is built up on them, and the maintenance of human society is based on the majority of men's believing in the truth of those doctrines. If men are taught that there is no almighty and all-just God, no divine world-order and no future life, they will feel exempt from all obligation to obey the precepts of civilization. Everyone will, without inhibition or fear, follow his asocial, egoistic instincts and seek to exercise his power; Chaos, which we have banished through many thousands of years of the work of civilization, will come again. Even if we knew, and could prove, that religion was not in possession of the truth, we ought to conceal the fact and behave in the way prescribed by the philosophy of "As if" - and this in the interest of the preservation of us all. And apart from the danger of the undertaking, it would be a purposeless cruelty. Countless people find their one consolation in religious doctrines, and can only bear life with their help. You would rob them of their support, without having anything better to give them in exchange. It is admitted that so far science has not achieved much, but even if it had advanced much further it would not suffice for man. Man has imperative needs of another sort, which can never be satisfied by cold science; and it is very strange - indeed, it is the height of inconsistency - that a psychologist who has always insisted on what a minor part is played in human affairs by the intelligence as compared with the life of the instincts - that such a psychologist should now try to rob mankind of a precious wish-fulfilment and should propose to compensate them for it with intellectual nourishment.'

What a lot of accusations all at once! Nevertheless I am ready with rebuttals for them all; and, what is more, I shall assert the view that civilization runs a greater risk if we maintain our present attitude to religion than if we give it up.

But I hardly know where to begin my reply. Perhaps with the assurance that I myself regard my undertaking as completely harmless and free of risk. It is not I who am overvaluing the intellect this time. If people are as my opponents describe them - and I should not like to contradict them - then there is no danger of a devout believer's being overcome by my arguments and deprived of his faith. Besides, I have said nothing which other and better men have not said before me in a much more complete, forcible and impressive manner. Their names are well known, and I shall not cite them, for I should not like to give an impression that I am seeking to rank myself as one of them. All I have done - and this is the only thing that is new in my exposition - is to add some psychological foundation to the criticisms of my great predecessors. It is hardly to be expected that precisely this addition will produce the effect which was denied to those earlier efforts. No doubt I might be asked here what is the point of writing these things if I am certain that they will be ineffective. But I shall come back to that later.

The one person this publication may injure is myself. I shall have to listen to the most disagreeable reproaches for my shallowness, narrow-mindedness and lack of idealism or of understanding for the highest interests of mankind. But on the one hand, such remonstrances are not new to me; and on the other, if a man has already learnt in his youth to rise superior to the disapproval of his contemporaries, what can it matter to him in his old age when he is certain soon to be beyond the reach of all favour or disfavour? In former times it was different. Then utterances such as mine brought with them a sure curtailment of one's earthly existence and an effective speeding-up of the opportunity for gaining a personal experience of the after-life. But, I repeat, those times are past and to-day writings such as this bring no more danger to their author than to their readers. The most that can happen is that the translation and distribution of his book will be forbidden in one country or another - and precisely, of course, in a country that is convinced of the high standard of its culture. But if one puts in any plea at all for the renunciation of wishes and for acquiescence in Fate, one must be able to tolerate this kind of injury too.

The further question occurred to me whether the publication of this work might not after all do harm. Not to a person, however, but to a cause - the cause of psycho-analysis. For it cannot be denied that psycho-analysis is my creation, and it has met with plenty of mistrust and ill-will. If I now come forward with such displeasing pronouncements, people will be only too ready to make a displacement from my person to psycho-analysis. 'Now we see,' they will say, 'where psycho-analysis leads to. The mask has fallen; it leads to a denial of God and of a moral ideal, as we always suspected. To keep us from this discovery we have been deluded into thinking that psycho-analysis has no *Weltanschauung* and never can construct one.'

An outcry of this kind will really be disagreeable to me on account of my many fellow-workers, some of whom do not by any means share my attitude to the problems of religion. But psycho-analysis has already weathered many storms and now it must brave this fresh one. In point of fact psycho-analysis is a method of research, an impartial instrument, like the infinitesimal calculus, as it were. If a physicist were to discover with the latter's help that after a certain time the earth would be destroyed, we would nevertheless hesitate to attribute destructive tendencies to the calculus itself and therefore to proscribe it. Nothing that I have said here against the truth-value of religions needed the support of psycho-analysis; it had been said by others long before analysis came into existence. If the application of the psycho-analytic method makes it possible to find a new argument against the truths of religion, *tant pis* for religion; but defenders of religion will by the same right make use of psycho-analysis in order to give full value to the affective significance of religious doctrines.

And now to proceed with our defence. Religion has clearly performed great services for human civilization. It has contributed much towards the taming of the asocial instincts. But not enough. It has ruled human society for many thousands of years and has had time to show what it can achieve. If it had succeeded in making the majority of mankind happy, in comforting them, in reconciling them to life and in making them into vehicles of civilization, no one would dream of attempting to alter the existing conditions. But what do we see instead? We see that an appallingly large number of people are dissatisfied with civilization and unhappy in it, and feel it as a yoke which must be shaken off; and that these people either do everything in their power to change that civilization, or else go so far in their hostility to it that they will have nothing to do with civilization or with a restriction of instinct. At this point it will be objected against us that this state of affairs is due to the very fact that religion has lost a part of its influence over human masses precisely because of the deplorable effect of the advances of science. We will note this admission and the reason given for it, and we shall make use of it later for our own purposes; but the objection itself has no force.

It is doubtful whether men were in general happier at a time when religious doctrines held unrestricted sway; more moral they certainly were not. They have always known how to externalize the precepts of religion and thus to nullify their intentions. The priests, whose duty it was to ensure obedience to religion, met them half-way in this. God's kindness must lay a restraining hand on His justice. One sinned, and then one made a sacrifice or did penance and then one was free to sin once more. Russian introspectiveness has reached the pitch of concluding that sin is indispensable for the enjoyment of all the blessings of divine grace, so that, at bottom, sin is pleasing to God. It is no secret that the priests could only keep the masses submissive to religion by making such large concessions as these to the instinctual nature of man. Thus it was agreed: God alone is strong and good, man is weak and sinful. In every age immorality has found no less support in religion than morality has. If the achievements of religion in respect to man's happiness, susceptibility to culture and moral control are no better than this, the question cannot but arise whether we are not overrating its necessity for mankind, and whether we do wisely in basing our cultural demands upon it.

Let us consider the unmistakable situation as it is to-day. We have heard the admission that religion no longer has the same influence on people that it used to. (We are here concerned with European Christian civilization.) And this is not because its promises have grown less but because people find them less credible. Let us admit that the reason - though perhaps not the only reason - for this change is the increase of the scientific spirit in the higher strata of human society. Criticism has whittled away the evidential value of religious documents, natural science has shown up the errors in them, and comparative research has been struck by the fatal resemblance between the religious ideas which we revere and the mental products of primitive peoples and times.

The scientific spirit brings about a particular attitude towards worldly matters; before religious matters it pauses for a little, hesitates, and finally there too crosses the threshold. In this process there is no stopping; the greater the number of men to whom the treasures of knowledge become accessible, the more widespread is the falling-away from religious belief - at first only from its obsolete and objectionable trappings, but later from its fundamental postulates as well. The Americans who instituted the 'monkey trial' at Dayton have alone shown themselves consistent. Elsewhere the inevitable transition is accomplished by way of half-measures and insincerities.

Civilization has little to fear from educated people and brain-workers. In them the replacement of religious motives for civilized behaviour by other, secular motives would proceed unobtrusively; moreover, such people are to a large extent themselves vehicles of civilization. But it is another matter with the great mass of the uneducated and oppressed, who have every reason for being enemies of civilization. So long as they do not discover that people no longer believe in God, all is well. But they will discover it, infallibly, even if this piece of writing of mine is not published. And they are ready to accept the results of scientific thinking, but without the change having taken place in them which scientific thinking brings about in people. Is there not a danger here that the hostility of these masses to civilization will throw itself against the weak spot that they have found in their task-mistress? If the sole reason why you must not kill your neighbour is because God has forbidden it and will severely punish you for it in this or the next life then, when you learn that there is no God and that you need not fear His punishment, you will certainly kill your neighbour without hesitation, and you can only be prevented from doing so by mundane force. Thus either these dangerous masses must be held down most severely and kept most carefully away from any chance of intellectual awakening, or else the relationship between civilization and religion must undergo a fundamental revision.

VIII

One might think that there would be no special difficulties in the way of carrying out this latter proposal. It is true that it would involve a certain amount of renunciation, but more would perhaps be gained than lost, and a great danger would be avoided. Everyone is frightened of it, however, as though it would expose civilization to a still greater danger. When St. Boniface cut down the tree that was venerated as sacred by the Saxons the bystanders expected some fearful event to follow upon the sacrilege. But nothing happened, and the Saxons accepted baptism.

When civilization laid down the commandment that a man shall not kill the neighbour whom he hates or who is in his way or whose property he covets, this was clearly done in the interest of man's communal existence, which would not otherwise be practicable. For the murderer would draw down on himself the vengeance of the murdered man's kinsmen and the secret envy of others, who within themselves feel as much inclined as he does for such acts of violence. Thus he would not enjoy his revenge or his robbery for long, but would have every prospect of soon being killed himself. Even if he protected himself against his single foes by extraordinary strength and caution, he would be bound to succumb to a combination of weaker men. If a combination of this sort did not take place, the murdering would continue endlessly and the final outcome would be that men would exterminate one another. We should arrive at the same state of affairs between individuals as still persists in Corsica between families, though elsewhere only between nations. Insecurity of life, which is an equal danger for everyone, now unites men into a society which prohibits the individual from killing and reserves to itself the right to communal killing of anyone who violates the prohibition. Here, then, we have justice and punishment.

But we do not publish this rational explanation of the prohibition against murder. We assert that the prohibition has been issued by God. Thus we take it upon ourselves to guess His intentions, and we find that He, too, is unwilling for men to exterminate one another. In behaving in this way we are investing the cultural prohibition with a quite special solemnity, but at the same time we risk making its observance dependent on belief in God. If we retrace this step - if we no longer attribute to God what is our own will and if we content ourselves with giving the social reason - then, it is true, we have renounced the transfiguration of the cultural prohibition, but we have also avoided the risk to it. But we gain something else as well. Through some kind of diffusion or infection, the character of sanctity and inviolability - of belonging to another world, one might say - has spread from a few major prohibitions on to every other cultural regulation, law and ordinance. But on these the halo often looks far from becoming: not only do they invalidate one another by giving contrary decisions at different times and places, but apart from this they show every sign of human inadequacy. It is easy to recognize in them things that can only be the product of short-sighted apprehensiveness or an expression of selfishly narrow interests or a conclusion based on insufficient premisses. The criticism which we cannot fail to level at them also diminishes to an unwelcome extent our respect for other, more justifiable cultural demands. Since it is an awkward task to separate what God Himself has demanded from what can be traced to the authority of an all-powerful parliament or a high judiciary, it would be an undoubted advantage if we were to leave God out altogether and honestly admit the purely human origin of all the regulations and precepts of civilization. Along with their pretended sanctity, these commandments and laws would lose their rigidity and unchangeableness as well. People could understand that they are made, not so much to rule them as, on the contrary, to serve their interests; and they would adopt a more friendly attitude to them, and instead of aiming at their abolition, would aim only at their improvement. This would be an important advance along the road which leads to becoming reconciled to the burden of civilization.

But here our plea for ascribing purely rational reasons to the precepts of civilization - that is to say, for deriving them from social necessity - is interrupted by a sudden doubt. We have chosen as our example the origin of the prohibition against murder. But does our account of it tally with historical truth? We fear not; it appears to be nothing but a rationalistic construction. With the help of psycho-analysis, we have made a study of precisely this piece of the cultural history of mankind, and, basing ourselves on it, we are bound to say that in reality things happened otherwise. Even in present-day man purely reasonable motives can effect little against passionate impulsions. How much weaker then must they have been in the human animal of primaeval times! Perhaps his descendants would even now kill one another without inhibition, if it were not that among those murderous acts there was one - the killing of the primitive father - which evoked an irresistible emotional reaction with momentous consequences. From it arose the commandment: Thou shalt not kill. Under totemism this commandment was restricted to the father-substitute; but it was later extended to other people, though even to-day it is not universally obeyed.

But, as was shown by arguments which I need not repeat here, the primal father was the original image of God, the model on which later generations have shaped the figure of God. Hence the religious explanation is right, God actually played a part in the genesis of that prohibition; it was His influence, not any insight into social necessity, which created it. And the displacement of man's will on to God is fully justified. For men knew that they had disposed of their father by violence, and in their reaction to that impious deed, they determined to respect his will thenceforward. Thus religious doctrine tells us the historical truth - though subject, it is true, to some modification and disguise - whereas our rational account disavows it.

We now observe that the store of religious ideas includes not only wish-fulfilments but important historical recollections. This concurrent influence of past and present must give religion a truly incomparable wealth of power. But perhaps with the help of an analogy yet another discovery may begin to dawn on us. Though it is not a good plan to transplant ideas far from the soil in which they grew up, yet here is a conformity which we cannot avoid pointing out. We know that a human child cannot successfully complete its development to the civilized stage without passing through a phase of neurosis sometimes of greater and sometimes of less distinctness. This is because so many instinctual demands which will later be unserviceable cannot be suppressed by the rational operation of the child's intellect but have to be tamed by acts of repression, behind which, as a rule, lies the motive of anxiety. Most of these infantile neuroses are overcome spontaneously in the course of growing up, and this is especially true of the obsessional neuroses of childhood. The remainder can be cleared up later still by psycho-analytic treatment. In just the same way, one might assume, humanity as a whole, in its development through the ages, fell into states analogous to the neuroses, and for the same reasons - namely because in the times of its ignorance and intellectual weakness the instinctual renunciations indispensable for man's communal existence had only been achieved by it by means of purely affective forces. The precipitates of these processes resembling repression which took place in prehistoric times still remained attached to civilization for long periods. Religion would thus be the universal obsessional neurosis of humanity; like the obsessional neurosis of children, it arose out of the Oedipus complex, out of the relation to the father. If this view is right, it is to be supposed that a turning-away from religion is bound to occur with the fatal inevitability of a process of growth, and that we find ourselves at this very juncture in the middle of that phase of development. Our behaviour should therefore be modelled on that of a sensible teacher who does not oppose an impending new development but seeks to ease its path and mitigate the violence of its irruption. Our analogy does not, to be sure, exhaust the essential nature of religion. If, on the one hand, religion brings with it obsessional restrictions, exactly as an individual obsessional neurosis does, on the other hand it comprises a system of wishful illusions together with a disavowal of reality, such as we find in an isolated form nowhere else but in amentia, in a state of blissful hallucinatory confusion. But these are only analogies, by the help of which we endeavour to understand a social phenomenon; the pathology of the individual does not supply us with a fully valid counterpart.

It has been repeatedly pointed out (by myself and in particular by Theodor Reik) in how great detail the analogy between religion and obsessional neurosis can be followed out, and how many of the peculiarities and vicissitudes in the formation of religion can be understood in that light. And it tallies well with this that devout believers are safeguarded in a high degree against the risk of certain neurotic illnesses; their acceptance of the universal neurosis spares them the task of constructing a personal one.

Our knowledge of the historical worth of certain religious doctrines increases our respect for them, but does not invalidate our proposal that they should cease to be put forward as the reasons for the precepts of civilization. On the contrary! Those historical residues have helped us to view religious teachings, as it were, as neurotic relics, and we may now argue that the time has probably come, as it does in an analytic treatment, for replacing the effects of repression by the results of the rational operation of the intellect. We may foresee, but hardly regret, that such a process of remoulding will not stop at renouncing the solemn transfiguration of cultural precepts, but that a general revision of them will result in many of them being done away with. In this way our appointed task of reconciling men to civilization will to a great extent be achieved. We need not deplore the renunciation of historical truth when we put forward rational grounds for the precepts of civilization. The truths contained in religious doctrines are after all so distorted and systematically disguised that the mass of humanity cannot recognize them as truth. The case is similar to what happens when we tell a child that new-born babies are brought by the stork. Here, too, we are telling the truth in symbolic clothing, for we know what the large bird signifies. But the child does not know it. He hears only the distorted part of what we say, and feels that he has been deceived; and we know how often his distrust of the grown-ups and his refractoriness actually take their start from this impression. We have become convinced that it is better to avoid such symbolic disguisings of the truth in what we tell children and not to withhold from them a knowledge of the true state of affairs commensurate with their intellectual level.

IX

'You permit yourself contradictions which are hard to reconcile with one another. You begin by saying that a piece of writing like yours is quite harmless: no one will let himself be robbed of his faith by considerations of the sort put forward in it. But since it is nevertheless your intention, as becomes evident later on, to upset that faith, we may ask why in fact you are publishing your work? In another passage, moreover, you admit that it may be dangerous, indeed very dangerous, for someone to discover that people no longer believe in God. Hitherto he has been docile, but now he throws off his obedience to the precepts of civilization. Yet your whole contention that basing the commandments of civilization on religious grounds constitutes a danger for civilization rests on the assumption that the believer can be turned into an unbeliever. Surely that is a complete contradiction.

'And here is another. On the one hand you admit that men cannot be guided through their intelligence, they are ruled by their passions and their instinctual demands. But on the other hand you propose to replace the affective basis of their obedience to civilization by a rational one. Let who can understand this. To me it seems that it must be either one thing or the other.

'Besides, have you learned nothing from history? Once before an attempt of this kind was made to substitute reason for religion, officially and in the grand manner. Surely you remember the French Revolution and Robespierre? And you must also remember how short-lived and miserably ineffectual the experiment was? The same experiment is being repeated in Russia at the present time, and we need not feel curious as to its outcome. Do you not think we may take it for granted that men cannot do without religion?

'You have said yourself that religion is more than an obsessional neurosis. But you have not dealt with this other side of it. You are content to work out the analogy with a neurosis. Men, you say, must be freed from a neurosis. What else may be lost in the process is of no concern to you.'

The appearance of contradiction has probably come about because I have dealt with complicated matters too hurriedly. But we can remedy this to some extent. I still maintain that what I have written is quite harmless in one respect. No believer will let himself be led astray from his faith by these or any similar arguments. A believer is bound to the teachings of religion by certain ties of affection. But there are undoubtedly countless other people who are not in the same sense believers. They obey the precepts of civilization because they let themselves be intimidated by the threats of religion, and they are afraid of religion so long as they have to consider it as a part of the reality which hems them in. They are the people who break away as soon as they are allowed to give up their belief in the reality-value of religion. But they too are unaffected by arguments. They cease to fear religion when they observe that others do not fear it; and it was of them that I asserted that they would get to know about the decline of religious influence even if I did not publish my work.

But I think you yourself attach more weight to the other contradiction which you charge me with. Since men are so little accessible to reasonable arguments and are so entirely governed by their instinctual wishes, why should one set out to deprive them of an instinctual satisfaction and replace it by reasonable arguments? It is true that men are like this; but have you asked yourself whether they *must* be like this, whether their innermost nature necessitates it? Can an anthropologist give the cranial index of a people whose custom it is to deform their children's heads by bandaging them round from their earliest years? Think of the depressing contrast between the radiant intelligence of a healthy child and the feeble intellectual powers of the average adult. Can we be quite certain that it is not precisely religious education which bears a large share of the blame for this relative atrophy? I think it would be a very long time before a child who was not influenced began to trouble himself about God and things in another world. Perhaps his thoughts on these matters would then take the same paths as they did with his forefathers. But we do not wait for such a development; we introduce him to the doctrines of religion at an age when he is neither interested in them nor capable of grasping their import. Is it not true that the two main points in the programme for the education of children to-day are retardation of sexual development and premature religious influence? Thus by the time the child's intellect awakens, the doctrines of religion have already become unassailable. But are you of opinion that it is very conducive to the strengthening of the intellectual function that so important a field should be closed against it by the threat of Hell-fire? When a man has once brought himself to accept uncritically all the absurdities that religious doctrines put before him and even to overlook the contradictions between them, we need not be greatly surprised at the weakness of his intellect. But we have no other means of controlling our instinctual nature but our intelligence. How can we expect people who are under the dominance of prohibitions of thought to attain the psychological ideal, the primacy of the intelligence? You know, too, that women in general are said to suffer from 'physiological feeble-mindedness' - that is, from a lesser intelligence than men. The fact itself is disputable and its interpretation doubtful, but one argument in favour of this intellectual atrophy being of a secondary nature is that women labour under the harshness of an early prohibition against turning their thoughts to what would most have interested them - namely, the problems of sexual life. So long as a person's early years are influenced not only by a sexual inhibition of thought but also by a religious inhibition and by a loyal inhibition derived from this, we cannot really tell what in fact he is like.

But I will moderate my zeal and admit the possibility that I, too, am chasing an illusion. Perhaps the effect of the religious prohibition of thought may not be so bad as I suppose; perhaps it will turn out that human nature remains the same even if education is not abused in order to subject people to religion. I do not know and you cannot know either. It is not only the great problems of this life that seem insoluble at the present time; many lesser questions too are difficult to answer. But you must admit that here we are justified in having a hope for the future - that perhaps there is a treasure to be dug up capable of enriching civilization and that it is worth making the experiment of an irreligious education. Should the experiment prove unsatisfactory I am ready to give up the reform and to return to my earlier, purely descriptive judgement that man is a creature of weak intelligence who is ruled by his instinctual wishes.

On another point I agree with you unreservedly. It is certainly senseless to begin by trying to do away with religion by force and at a single blow. Above all, because it would be hopeless. The believer will not let his belief be torn from him, either by arguments or by prohibitions. And even if this did succeed with some it would be cruelty. A man who has been taking sleeping draughts for tens of years is naturally unable to sleep if his sleeping draught is taken away from him. That the effect of religious consolations may be likened to that of a narcotic is well illustrated by what is happening in America. There they are now trying - obviously under the influence of petticoat government - to deprive people of all stimulants, intoxicants, and other pleasure-producing substances, and instead, by way of compensation, are surfeiting them with piety. This is another experiment as to whose outcome we need not feel curious.

Thus I must contradict you when you go on to argue that men are completely unable to do without the consolation of the religious illusion, that without it they could not bear the troubles of life and the cruelties of reality. That is true, certainly, of the men into whom you have instilled the sweet - or bitter-sweet - poison from childhood onwards. But what of the other men, who have been sensibly brought up? Perhaps those who do not suffer from the neurosis will need no intoxicant to deaden it. They will, it is true, find themselves in a difficult situation. They will have to admit to themselves the full extent of their helplessness and their insignificance in the machinery of the universe; they can no longer be the centre of creation, no longer the object of tender care on the part of a beneficent Providence. They will be in the same position as a child who has left the parental house where he was so warm and comfortable. But surely infantilism is destined to be surmounted. Men cannot remain children for ever; they must in the end go out into 'hostile life'. We may call this '*education to reality*'. Need I confess to you that the sole purpose of my book is to point out the necessity for this forward step?

You are afraid, probably, that they will not stand up to the hard test? Well, let us at least hope they will. It is something, at any rate, to know that one is thrown upon one's own resources. One learns then to make a proper use of them. And men are not entirely without assistance. Their scientific knowledge has taught them much since the days of the Deluge, and it will increase their power still further. And, as for the great necessities of Fate, against which there is no help, they will learn to endure them with resignation. Of what use to them is the mirage of wide acres in the moon, whose harvest no one has ever yet seen? As honest smallholders on this earth they will know how to cultivate their plot in such a way that it supports them. By withdrawing their expectations from the other world and concentrating all their liberated energies into their life on earth, they will probably succeed in achieving a state of things in which life will become tolerable for everyone and civilization no longer oppressive to anyone. Then, with one of our fellow-unbelievers, they will be able to say without regret:

Den Himmel überlassen wir
Den Engeln und den Spatzen.

X

That sounds splendid! A race of men who have renounced all illusions and have thus become capable of making their existence on earth tolerable! I, however, cannot share your expectations. And that is not because I am the obstinate reactionary you perhaps take me for. No, it is because I am sensible. We seem now to have exchanged roles: you emerge as an enthusiast who allows himself to be carried away by illusions, and I stand for the claims of reason, the rights of scepticism. What you have been expounding seems to me to be built upon errors which, following your example, I may call illusions, because they betray clearly enough the influence of your wishes. You pin your hope on the possibility that generations which have not experienced the influence of religious doctrines in early childhood will easily attain the desired primacy of the intelligence over the life of the instincts. This is surely an illusion: in this decisive respect human nature is hardly likely to change. If I am not mistaken - one knows so little about other civilizations - there are even to-day peoples which do not grow up under the pressure of a religious system, and yet they approach no nearer to your ideal than the rest. If you want to expel religion from our European civilization, you can only do it by means of another system of doctrines; and such a system would from the outset take over all the psychological characteristics of religion - the same sanctity, rigidity and intolerance, the same prohibition of thought - for its own defence. You have to have something of the kind in order to meet the requirements of education. And you cannot do without education. The path from the infant at the breast to the civilized man is a long one; too many human young would go astray on it and fail to reach their life-tasks at the proper time if they were left without guidance to their own development. The doctrines which had been applied in their upbringing would always set limits to the thinking of their riper years - which is exactly what you reproach religion with doing to-day. Do you not observe that it is an ineradicable and innate defect of our and every other civilization, that it imposes on children, who are driven by instinct and weak in intellect, the making of decisions which only the mature intelligence of adults can vindicate? But civilization cannot do otherwise, because of the fact that mankind's age-long development is compressed into a few years of childhood; and it is only by emotional forces that the child can be induced to master the task set before it. Such, then, are the prospects for your "primacy of the intellect".

'And now you must not be surprised if I plead on behalf of retaining the religious doctrinal system as the basis of education and of man's communal life. This is a practical problem, not a question of reality-value. Since, for the sake of preserving our civilization, we cannot postpone influencing the individual until he has become ripe for civilization (and many would never become so in any case), since we are obliged to impose on the growing child some doctrinal system which shall operate in him as an axiom that admits of no criticism, it seems to me that the religious system is by far the most suitable for the purpose. And it is so, of course, precisely on account of its wish-fulfilling and consolatory power, by which you claim to recognize it as an "illusion". In view of the difficulty of discovering anything about reality - indeed, of the doubt whether it is possible for us to do so at all - we must not overlook the fact that human needs, too, are a piece of reality, and, in fact, an important piece and one that concerns us especially closely.

'Another advantage of religious doctrine resides, to my mind, in one of its characteristics to which you seem to take particular exception. For it allows of a refinement and sublimation of ideas, which make it possible for it to be divested of most of the traces which it bears of primitive and infantile thinking. What then remains is a body of ideas which science no longer contradicts and is unable to disprove. These modifications of religious doctrine, which you have condemned as half-measures and compromises, make it possible to avoid the cleft between the uneducated masses and the philosophic thinker, and to preserve the common bond between them which is so important for the safeguarding of civilization. With this, there would be no need to fear that the men of the people would discover that the upper strata of society "no longer believe in God". I think I have now shown that your endeavours come down to an attempt to replace a proved and emotionally valuable illusion by another one, which is unproved and without emotional value.'

You will not find me inaccessible to your criticism. I know how difficult it is to avoid illusions; perhaps the hopes I have confessed to are of an illusory nature, too. But I hold fast to one distinction. Apart from the fact that no penalty is imposed for not sharing them, my illusions are not, like religious ones, incapable of correction. They have not the character of a delusion. If experience should show - not to me, but to others after me, who think as I do - that we have been mistaken, we will give up our expectations. Take my attempt for what it is. A psychologist who does not deceive himself about the difficulty of finding one's bearings in this world, makes an endeavour to assess the development of man, in the light of the small portion of knowledge he has gained through a study of the mental processes of individuals during their development from child to adult. In so doing, the idea forces itself upon him that religion is comparable to a childhood neurosis, and he is optimistic enough to suppose that mankind will surmount this neurotic phase, just as so many children grow out of their similar neurosis. These discoveries derived from individual psychology may be insufficient, their application to the human race unjustified, and his optimism unfounded. I grant you all these uncertainties. But often one cannot refrain from saying what one thinks, and one excuses oneself on the ground that one is not giving it out for more than it is worth.

And there are two points that I must dwell on a little longer. Firstly, the weakness of my position does not imply any strengthening of yours. I think you are defending a lost cause. We may insist as often as we like that man's intellect is powerless in comparison with his instinctual life, and we may be right in this. Nevertheless, there is something peculiar about this weakness. The voice of the intellect is a soft one, but it does not rest till it has gained a hearing. Finally, after a countless succession of rebuffs, it succeeds. This is one of the few points on which one may be optimistic about the future of mankind, but it is in itself a point of no small importance. And from it one can derive yet other hopes. The primacy of the intellect lies, it is true, in a distant, distant future, but probably not in an *infinitely* distant one. It will presumably set itself the same aims as those whose realization you expect from your God (of course within human limits - so far as external reality, *Αναγκη*, allows it), namely the love of man and the decrease of suffering. This being so, we may tell ourselves that our antagonism is only a temporary one and not irreconcilable. We desire the same things, but you are more impatient, more exacting, and - why should I not say it? - more self-seeking than I and those on my side. You would have the state of bliss begin directly after death; you expect the impossible from it and you will not surrender the claims of the individual. Our God, *Λσγοξ*,¹ will fulfil whichever of these wishes nature outside us allows, but he will do it very gradually, only in the unforeseeable future, and for a new generation of men. He promises no compensation for us, who suffer grievously from life. On the way to this distant goal your religious doctrines will have to be discarded, no matter whether the first attempts fail, or whether the first substitutes prove to be untenable. You know why: in the long run nothing can withstand reason and experience, and the contradiction which religion offers to both is all too palpable. Even purified religious ideas cannot escape this fate, so long as they try to preserve anything of the consolation of religion. No doubt if they confine themselves to a belief in a higher spiritual being, whose qualities are indefinable and whose purposes cannot be discerned, they will be proof against the challenge of science; but then they will also lose their hold on human interest.

And secondly: observe the difference between your attitude to illusions and mine. You have to defend the religious illusion with all your might. If it becomes discredited - and indeed the threat to it is great enough - then your world collapses. There is nothing left for you but to despair of everything, of civilization and the future of mankind. From that bondage I am, we are, free. Since we are prepared to renounce a good part of our infantile wishes, we can bear it if a few of our expectations turn out to be illusions.

¹ The twin gods *Λσγοξ* and *Αναγκη* of the Dutch writer Multatuli.

Education freed from the burden of religious doctrines will not, it may be, effect much change in men's psychological nature. Our god *Ασγοξ* is perhaps not a very almighty one, and he may only be able to fulfil a small part of what his predecessors have promised. If we have to acknowledge this we shall accept it with resignation. We shall not on that account lose our interest in the world and in life, for we have one sure support which you lack. We believe that it is possible for scientific work to gain some knowledge about the reality of the world, by means of which we can increase our power and in accordance with which we can arrange our life. If this belief is an illusion, then we are in the same position as you. But science has given us evidence by its numerous and important successes that it is no illusion. Science has many open enemies, and many more secret ones, among those who cannot forgive her for having weakened religious faith and for threatening to overthrow it. She is reproached for the smallness of the amount she has taught us and for the incomparably greater field she has left in obscurity. But, in this, people forget how young she is, how difficult her beginnings were and how infinitesimally small is the period of time since the human intellect has been strong enough for the tasks she sets. Are we not all at fault, in basing our judgements on periods of time that are too short? We should make the geologists our pattern. People complain of the unreliability of science - how she announces as a law to-day what the next generation recognizes as an error and replaces by a new law whose accepted validity lasts no longer. But this is unjust and in part untrue. The transformations of scientific opinion are developments, advances, not revolutions. A law which was held at first to be universally valid proves to be a special case of a more comprehensive uniformity, or is limited by another law, not discovered till later; a rough approximation to the truth is replaced by a more carefully adapted one, which in turn awaits further perfecting. There are various fields where we have not yet surmounted a phase of research in which we make trial with hypotheses that soon have to be rejected as inadequate; but in other fields we already possess an assured and almost unalterable core of knowledge. Finally, an attempt has been made to discredit scientific endeavour in a radical way, on the ground that, being bound to the conditions of our own organization, it can yield nothing else than subjective results, whilst the real nature of things outside ourselves remains inaccessible. But this is to disregard several factors which are of decisive importance for the understanding of scientific work. In the first place, our organization - that is, our mental apparatus - has been developed precisely in the attempt to explore the external world, and it must therefore have realized in its structure some degree of expediency; in the second place, it is itself a constituent part of the world which we set out to investigate, and it readily admits of such an investigation; thirdly, the task of science is fully covered if we limit it to showing how the world must appear to us in consequence of the particular character of our organization; fourthly, the ultimate findings of science, precisely because of the way in which they are acquired, are determined not only by our organization but by the things which have affected that organization; finally, the problem of the nature of the world without regard to our percipient mental apparatus is an empty abstraction, devoid of practical interest.

No, our science is no illusion. But an illusion it would be to suppose that what science cannot give us we can get elsewhere.

Intentionally left blank

CIVILIZATION AND ITS DISCONTENTS

I

It is impossible to escape the impression that people commonly use false standards of measurement - that they seek power, success and wealth for themselves and admire them in others, and that they underestimate what is of true value in life. And yet, in making any general judgement of this sort, we are in danger of forgetting how variegated the human world and its mental life are. There are a few men from whom their contemporaries do not withhold admiration, although their greatness rests on attributes and achievements which are completely foreign to the aims and ideals of the multitude. One might easily be inclined to suppose that it is after all only a minority which appreciates these great men, while the large majority cares nothing for them. But things are probably not as simple as that, thanks to the discrepancies between people's thoughts and their actions, and to the diversity of their wishful impulses.

One of these exceptional few calls himself my friend in his letters to me. I had sent him my small book that treats religion as an illusion, and he answered that he entirely agreed with my judgement upon religion, but that he was sorry I had not properly appreciated the true source of religious sentiments. This, he says, consists in a peculiar feeling, which he himself is never without, which he finds confirmed by many others, and which he may suppose is present in millions of people. It is a feeling which he would like to call a sensation of 'eternity', a feeling as of something limitless, unbounded - as it were, 'oceanic'. This feeling, he adds, is a purely subjective fact, not an article of faith; it brings with it no assurance of personal immortality, but it is the source of the religious energy which is seized upon by the various Churches and religious systems, directed by them into particular channels, and doubtless also exhausted by them. One may, he thinks, rightly call oneself religious on the ground of this oceanic feeling alone, even if one rejects every belief and every illusion.

The views expressed by the friend whom I so much honour, and who himself once praised the magic of illusion in a poem,¹ caused me no small difficulty. I cannot discover this 'oceanic' feeling in myself. It is not easy to deal scientifically with feelings. One can attempt to describe their physiological signs. Where this is not possible - and I am afraid that the oceanic feeling too will defy this kind of characterization - nothing remains but to fall back on the ideational content which is most readily associated with the feeling. If I have understood my friend rightly, he means the same thing by it as the consolation offered by an original and somewhat eccentric dramatist to his hero who is facing a self-inflicted death. 'We cannot fall out of this world.'² That is to say, it is a feeling of an indissoluble bond, of being one with the external world as a whole. I may remark that to me this seems something rather in the nature of an intellectual perception, which is not, it is true, without an accompanying feeling-tone, but only such as would be present with any other act of thought of equal range. From my own experience I could not convince myself of the primary nature of such a feeling. But this gives me no right to deny that it does in fact occur in other people. The only question is whether it is being correctly interpreted and whether it ought to be regarded as the *fons et origo* of the whole need for religion.

¹ *Liluli*. Since the publication of his two books *La vie de Ramakrishna* and *La vie de Vivekananda*, I need no longer hide the fact that the friend spoken of in the text is Romain Rolland.

² Christian Dietrich Grabbe, *Hannibal*: 'Ja, aus der Welt werden wir nicht fallen. Wir sind einmal darin.'

I have nothing to suggest which could have a decisive influence on the solution of this problem. The idea of men's receiving an intimation of their connection with the world around them through an immediate feeling which is from the outset directed to that purpose sounds so strange and fits in so badly with the fabric of our psychology that one is justified in attempting to discover a psycho-analytic - that is, a genetic - explanation of such a feeling. The following line of thought suggests itself. Normally, there is nothing of which we are more certain than the feeling of our self, of our own ego. This ego appears to us as something autonomous and unitary, marked off distinctly from everything else. That such an appearance is deceptive, and that on the contrary the ego is continued inwards, without any sharp delimitation, into an unconscious mental entity which we designate as the id and for which it serves as a kind of façade - this was a discovery first made by psycho-analytic research, which should still have much more to tell us about the relation of the ego to the id. But towards the outside, at any rate, the ego seems to maintain clear and sharp lines of demarcation. There is only one state - admittedly an unusual state, but not one that can be stigmatized as pathological - in which it does not do this. At the height of being in love the boundary between ego and object threatens to melt away. Against all the evidence of his senses, a man who is in love declares that 'I' and 'you' are one, and is prepared to behave as if it were a fact. What can be temporarily done away with by a physiological function must also, of course, be liable to be disturbed by pathological processes. Pathology has made us acquainted with a great number of states in which the boundary lines between the ego and the external world become uncertain or in which they are actually drawn incorrectly. There are cases in which parts of a person's own body, even portions of his own mental life - his perceptions, thoughts and feelings -, appear alien to him and as not belonging to his ego; there are other cases in which he ascribes to the external world things that clearly originate in his own ego and that ought to be acknowledged by it. Thus even the feeling of our own ego is subject to disturbances and the boundaries of the ego are not constant.

Further reflection tells us that the adult's ego-feeling cannot have been the same from the beginning. It must have gone through a process of development, which cannot, of course, be demonstrated but which admits of being constructed with a fair degree of probability.¹ An infant at the breast does not as yet distinguish his ego from the external world as the source of the sensations flowing in upon him. He gradually learns to do so, in response to various promptings. He must be very strongly impressed by the fact that some sources of excitation, which he will later recognize as his own bodily organs, can provide him with sensations at any moment, whereas other sources evade him from time to time - among them what he desires most of all, his mother's breast - and only reappear as a result of his screaming for help. In this way there is for the first time set over against the ego an 'object', in the form of something which exists 'outside' and which is only forced to appear by a special action. A further incentive to a disengagement of the ego from the general mass of sensations - that is, to the recognition of an 'outside', an external world - is provided by the frequent, manifold and unavoidable sensations of pain and unpleasure the removal and avoidance of which is enjoined by the pleasure principle, in the exercise of its unrestricted domination. A tendency arises to separate from the ego everything that can become a source of such unpleasure, to throw it outside and to create a pure pleasure-ego which is confronted by a strange and threatening 'outside'. The boundaries of this primitive pleasure-ego cannot escape rectification through experience. Some of the things that one is unwilling to give up, because they give pleasure, are nevertheless not ego but object; and some sufferings that one seeks to expel turn out to be inseparable from the ego in virtue of their internal origin. One comes to learn a procedure by which, through a deliberate direction of one's sensory activities and through suitable muscular action, one can differentiate between what is internal - what belongs to the ego - and what is external - what emanates from the outer world. In this way one makes the first step towards the introduction of the reality principle which is to dominate future development. This differentiation, of course, serves the practical purpose of enabling one to defend oneself against sensations of unpleasure which one actually feels or with which one is threatened. In order to fend off certain unpleasurable excitations arising from within, the ego can use no other methods than those which it uses against unpleasure coming from without, and this is the starting-point of important pathological disturbances.

¹ Cf. the many writings on the topic of ego-development and ego-feeling, dating from Ferenczi's paper on 'Stages in the Development of the Sense of Reality' (1913) to Federn's contributions of 1926, 1927 and later.

In this way, then, the ego detaches itself from the external world. Or, to put it more correctly, originally the ego includes everything, later it separates off an external world from itself. Our present ego-feeling is, therefore, only a shrunken residue of a much more inclusive - indeed, an all-embracing - feeling which corresponded to a more intimate bond between the ego and the world about it. If we may assume that there are many people in whose mental life this primary ego-feeling has persisted to a greater or less degree, it would exist in them side by side with the narrower and more sharply demarcated ego-feeling of maturity, like a kind of counterpart to it. In that case, the ideational contents appropriate to it would be precisely those of limitlessness and of a bond with the universe - the same ideas with which my friend elucidated the 'oceanic' feeling.

But have we a right to assume the survival of something that was originally there, alongside of what was later derived from it? Undoubtedly. There is nothing strange in such a phenomenon, whether in the mental field or elsewhere. In the animal kingdom we hold to the view that the most highly developed species have proceeded from the lowest; and yet we find all the simple forms still in existence to-day. The race of the great saurians is extinct and has made way for the mammals; but a true representative of it, the crocodile, still lives among us. This analogy may be too remote, and it is also weakened by the circumstance that the lower species which survive are for the most part not the true ancestors of the present-day more highly developed species. As a rule the intermediate links have died out and are known to us only through reconstruction. In the realm of the mind, on the other hand, what is primitive is so commonly preserved alongside of the transformed version which has arisen from it that it is unnecessary to give instances as evidence. When this happens it is usually in consequence of a divergence in development: one portion (in the quantitative sense) of an attitude or instinctual impulse has remained unaltered, while another portion has undergone further development.

This brings us to the more general problem of preservation in the sphere of the mind. The subject has hardly been studied yet; but it is so attractive and important that we may be allowed to turn our attention to it for a little, even though our excuse is insufficient. Since we overcame the error of supposing that the forgetting we are familiar with signified a destruction of the memory-trace - that is, its annihilation - we have been inclined to take the opposite view, that in mental life nothing which has once been formed can perish - that everything is somehow preserved and that in suitable circumstances (when, for instance, regression goes back far enough) it can once more be brought to light. Let us try to grasp what this assumption involves by taking an analogy from another field. We will choose as an example the history of the Eternal City.¹ Historians tell us that the oldest Rome was the *Roma Quadrata*, a fenced settlement on the Palatine. Then followed the phase of the *Septimontium*, a federation of the settlements on the different hills; after that came the city bounded by the Servian wall; and later still, after all the transformations during the periods of the republic and the early Caesars, the city which the Emperor Aurelian surrounded with his walls. We will not follow the changes which the city went through any further, but we will ask ourselves how much a visitor, whom we will suppose to be equipped with the most complete historical and topographical knowledge, may still find left of these early stages in the Rome of to-day. Except for a few gaps, he will see the wall of Aurelian almost unchanged. In some places he will be able to find sections of the Servian wall where they have been excavated and brought to light. If he knows enough - more than present-day archaeology does - he may perhaps be able to trace out in the plan of the city the whole course of that wall and the outline of the *Roma Quadrata*. Of the buildings which once occupied this ancient area he will find nothing, or only scanty remains, for they exist no longer. The best information about Rome in the republican era would only enable him at the most to point out the sites where the temples and public buildings of that period stood. Their place is now taken by ruins, but not by ruins of themselves but of later restorations made after fires or destruction. It is hardly necessary to remark that all these remains of ancient Rome are found dovetailed into the jumble of a great metropolis which has grown up in the last few centuries since the Renaissance. There is certainly not a little that is ancient still buried in the soil of the city or beneath its modern buildings. This is the manner in which the past is preserved in historical sites like Rome.

¹ Based on *The Cambridge Ancient History*, 7 (1928): 'The Founding of Rome' by Hugh Last.

Now let us, by a flight of imagination, suppose that Rome is not a human habitation but a psychical entity with a similarly long and copious past - an entity, that is to say, in which nothing that has once come into existence will have passed away and all the earlier phases of development continue to exist alongside the latest one. This would mean that in Rome the palaces of the Caesars and the Septizonium of Septimius Severus would still be rising to their old height on the Palatine and that the castle of S. Angelo would still be carrying on its battlements the beautiful statues which graced it until the siege by the Goths, and so on. But more than this. In the place occupied by the Palazzo Caffarelli would once more stand - without the Palazzo having to be removed - the Temple of Jupiter Capitolinus; and this not only in its latest shape, as the Romans of the Empire saw it, but also in its earliest one, when it still showed Etruscan forms and was ornamented with terracotta antefixes. Where the Coliseum now stands we could at the same time admire Nero's vanished Golden House. On the Piazza of the Pantheon we should find not only the Pantheon of to-day, as it was bequeathed to us by Hadrian, but, on the same site, the original edifice erected by Agrippa; indeed, the same piece of ground would be supporting the church of Santa Maria sopra Minerva and the ancient temple over which it was built. And the observer would perhaps only have to change the direction of his glance or his position in order to call up the one view or the other.

There is clearly no point in spinning our phantasy any further, for it leads to things that are unimaginable and even absurd. If we want to represent historical sequence in spatial terms we can only do it by juxtaposition in space: the same space cannot have two different contents. Our attempt seems to be an idle game. It has only one justification. It shows us how far we are from mastering the characteristics of mental life by representing them in pictorial terms.

There is one further objection which has to be considered. The question may be raised why we chose precisely the past of a *city* to compare with the past of the mind. The assumption that everything past is preserved holds good even in mental life only on condition that the organ of the mind has remained intact and that its tissues have not been damaged by trauma or inflammation. But destructive influences which can be compared to causes of illness like these are never lacking in the history of a city, even if it has had a less chequered past than Rome, and even if, like London, it has hardly ever suffered from the visitations of an enemy. Demolitions and replacement of buildings occur in the course of the most peaceful development of a city. A city is thus *a priori* unsuited for a comparison of this sort with a mental organism.

We bow to this objection; and, abandoning our attempt to draw a striking contrast, we will turn instead to what is after all a more closely related object of comparison - the body of an animal or a human being. But here, too, we find the same thing. The earlier phases of development are in no sense still preserved; they have been absorbed into the later phases for which they have supplied the material. The embryo cannot be discovered in the adult. The thymus gland of childhood is replaced after puberty by connective tissue, but is no longer present itself; in the marrow-bones of the grown man I can, it is true, trace the outline of the child's bone, but it itself has disappeared, having lengthened and thickened until it has attained its definitive form. The fact remains that only in the mind is such a preservation of all the earlier stages alongside of the final form possible, and that we are not in a position to represent this phenomenon in pictorial terms.

Perhaps we are going too far in this. Perhaps we ought to content ourselves with asserting that what is past in mental life *may* be preserved and is not *necessarily* destroyed. It is always possible that even in the mind some of what is old is effaced or absorbed - whether in the normal course of things or as an exception - to such an extent that it cannot be restored or revived by any means; or that preservation in general is dependent on certain favourable conditions. It is possible, but we know nothing about it. We can only hold fast to the fact that it is rather the rule than the exception for the past to be preserved in mental life.

Thus we are perfectly willing to acknowledge that the 'oceanic' feeling exists in many people, and we are inclined to trace it back to an early phase of ego-feeling. The further question then arises, what claim this feeling has to be regarded as the source of religious needs.

To me the claim does not seem compelling. After all, a feeling can only be a source of energy if it is itself the expression of a strong need. The derivation of religious needs from the infant's helplessness and the longing for the father aroused by it seems to me incontrovertible, especially since the feeling is not simply prolonged from childhood days, but is permanently sustained by fear of the superior power of Fate. I cannot think of any need in childhood as strong as the need for a father's protection. Thus the part played by the oceanic feeling, which might seek something like the restoration of limitless narcissism, is ousted from a place in the foreground. The origin of the religious attitude can be traced back in clear outlines as far as the feeling of infantile helplessness. There may be something further behind that, but for the present it is wrapped in obscurity.

I can imagine that the oceanic feeling became connected with religion later on. The 'oneness with the universe' which constitutes its ideational content sounds like a first attempt at a religious consolation, as though it were another way of disclaiming the danger which the ego recognizes as threatening it from the external world. Let me admit once more that it is very difficult for me to work with these almost intangible quantities. Another friend of mine, whose insatiable craving for knowledge has led him to make the most unusual experiments and has ended by giving him encyclopaedic knowledge, has assured me that through the practices of Yoga, by withdrawing from the world, by fixing the attention on bodily functions and by peculiar methods of breathing, one can in fact evoke new sensations and coenaesthesias in oneself, which he regards as regressions to primordial states of mind which have long ago been overlaid. He sees in them a physiological basis, as it were, of much of the wisdom of mysticism. It would not be hard to find connections here with a number of obscure modifications of mental life, such as trances and ecstasies. But I am moved to exclaim in the words of Schiller's diver:-

' . . . Es freue sich.
Wer da atmet im rosigten Licht.'

II

In my *Future of an Illusion* I was concerned much less with the deepest sources of the religious feeling than with what the common man understands by his religion - with the system of doctrines and promises which on the one hand explains to him the riddles of this world with enviable completeness, and, on the other, assures him that a careful Providence will watch over his life and will compensate him in a future existence for any frustrations he suffers here. The common man cannot imagine this Providence otherwise than in the figure of an enormously exalted father. Only such a being can understand the needs of the children of men and be softened by their prayers and placated by the signs of their remorse. The whole thing is so patently infantile, so foreign to reality, that to anyone with a friendly attitude to humanity it is painful to think that the great majority of mortals will never be able to rise above this view of life. It is still more humiliating to discover how large a number of people living to-day, who cannot but see that this religion is not tenable, nevertheless try to defend it piece by piece in a series of pitiful rearguard actions. One would like to mix among the ranks of the believers in order to meet these philosophers, who think they can rescue the God of religion by replacing him by an impersonal, shadowy and abstract principle, and to address them with the warning words: 'Thou shalt not take the name of the Lord thy God in Vain!' And if some of the great men of the past acted in the same way, no appeal can be made to their example: we know why they were obliged to.

Let us return to the common man and to his religion - the only religion which ought to bear that name. The first thing that we think of is the well-known saying of one of our great poets and thinkers concerning the relation of religion to art and science:

Wer Wissenschaft und Kunst besitzt, hat auch Religion;
Wer jene beide nicht besitzt, der habe Religion!

This saying on the one hand draws an antithesis between religion and the two highest achievements of man, and on the other, asserts that, as regards their value in life, those achievements and religion can represent or replace each other. If we also set out to deprive the common man of his religion, we shall clearly not have the poet's authority on our side. We will choose a particular path to bring us nearer an appreciation of his words. Life, as we find it, is too hard for us; it brings us too many pains, disappointments and impossible tasks. In order to bear it we cannot dispense with palliative measures. 'We cannot do without auxiliary constructions', as Theodor Fontane tells us. There are perhaps three such measures: powerful deflections, which cause us to make light of our misery; substitutive satisfactions, which diminish it; and intoxicating substances, which make us insensitive to it. Something of the kind is indispensable.¹ Voltaire has deflections in mind when he ends *Candide* with the advice to cultivate one's garden; and scientific activity is a deflection of this kind, too. The substitutive satisfactions, as offered by art, are illusions in contrast with reality, but they are none the less psychically effective, thanks to the role which phantasy has assumed in mental life. The intoxicating substances influence our body and alter its chemistry. It is no simple matter to see where religion has its place in this series. We must look further afield.

The question of the purpose of human life has been raised countless times; it has never yet received a satisfactory answer and perhaps does not admit of one. Some of those who have asked it have added that if it should turn out that life has no purpose, it would lose all value for them. But this threat alters nothing. It looks, on the contrary, as though one had a right to dismiss the question, for it seems to derive from the human presumptuousness, many other manifestations of which are already familiar to us. Nobody talks about the purpose of the life of animals, unless, perhaps, it may be supposed to lie in being of service to man. But this view is not tenable either, for there are many animals of which man can make nothing, except to describe, classify and study them; and innumerable species of animals have escaped even this use, since they existed and became extinct before man set eyes on them. Once again, only religion can answer the question of the purpose of life. One can hardly be wrong in concluding that the idea of life having a purpose stands and falls with the religious system.

¹ In *Die Fromme Helene* Wilhelm Busch has said the same thing on a lower plane: 'Wer Sorgen hat, hat auch Likör.'

We will therefore turn to the less ambitious question of what men themselves show by their behaviour to be the purpose and intention of their lives. What do they demand of life and wish to achieve in it? The answer to this can hardly be in doubt. They strive after happiness; they want to become happy and to remain so. This endeavour has two sides, a positive and a negative aim. It aims, on the one hand, at an absence of pain and unpleasure, and, on the other, at the experiencing of strong feelings of pleasure. In its narrower sense the word 'happiness' only relates to the last. In conformity with this dichotomy in his aims, man's activity develops in two directions, according as it seeks to realize - in the main, or even exclusively - the one or the other of these aims.

As we see, what decides the purpose of life is simply the programme of the pleasure principle. This principle dominates the operation of the mental apparatus from the start. There can be no doubt about its efficacy, and yet its programme is at loggerheads with the whole world, with the macrocosm as much as with the microcosm. There is no possibility at all of its being carried through; all the regulations of the universe run counter to it. One feels inclined to say that the intention that man should be 'happy' is not included in the plan of 'Creation'. What we call happiness in the strictest sense comes from the (preferably sudden) satisfaction of needs which have been dammed up to a high degree, and it is from its nature only possible as an episodic phenomenon. When any situation that is desired by the pleasure principle is prolonged, it only produces a feeling of mild contentment. We are so made that we can derive intense enjoyment only from a contrast and very little from a state of things.¹ Thus our possibilities of happiness are already restricted by our constitution. Unhappiness is much less difficult to experience. We are threatened with suffering from three directions: from our own body, which is doomed to decay and dissolution and which cannot even do without pain and anxiety as warning signals; from the external world, which may rage against us with overwhelming and merciless forces of destruction; and finally from our relations to other men. The suffering which comes from this last source is perhaps more painful to us than any other. We tend to regard it as a kind of gratuitous addition, although it cannot be any less fatefully inevitable than the suffering which comes from elsewhere.

¹ Goethe, indeed, warns us that 'nothing is harder to bear than a succession of fair days.' But this may be an exaggeration.

It is no wonder if, under the pressure of these possibilities of suffering, men are accustomed to moderate their claims to happiness - just as the pleasure principle itself, indeed, under the influence of the external world, changed into the more modest reality principle -, if a man thinks himself happy merely to have escaped unhappiness or to have survived his suffering, and if in general the task of avoiding suffering pushes that of obtaining pleasure into the background. Reflection shows that the accomplishment of this task can be attempted along very different paths; and all these paths have been recommended by the various schools of worldly wisdom and put into practice by men. An unrestricted satisfaction of every need presents itself as the most enticing method of conducting one's life, but it means putting enjoyment before caution, and soon brings its own punishment. The other methods, in which avoidance of unpleasure is the main purpose, are differentiated according to the source of unpleasure to which their attention is chiefly turned. Some of these methods are extreme and some moderate; some are one-sided and some attack the problem simultaneously at several points. Against the suffering which may come upon one from human relationships the readiest safeguard is voluntary isolation, keeping oneself aloof from other people. The happiness which can be achieved along this path is, as we see, the happiness of quietness. Against the dreaded external world one can only defend oneself by some kind of turning away from it, if one intends to solve the task by oneself. There is, indeed, another and better path: that of becoming a member of the human community, and, with the help of a technique guided by science, going over to the attack against nature and subjecting her to the human will. Then one is working with all for the good of all. But the most interesting methods of averting suffering are those which seem to influence our own organism. In the last analysis, all suffering is nothing else than sensation; it only exists in so far as we feel it, and we only feel it in consequence of certain ways in which our organism is regulated.

The crudest, but also the most effective among these methods of influence is the chemical one - intoxication. I do not think that anyone completely understands its mechanism, but it is a fact that there are foreign substances which, when present in the blood or tissues, directly cause us pleasurable sensations; and they also so alter the conditions governing our sensibility that we become incapable of receiving unpleasurable impulses. The two effects not only occur simultaneously, but seem to be intimately bound up with each other. But there must be substances in the chemistry of our own bodies which have similar effects, for we know at least one pathological state, mania, in which a condition similar to intoxication arises without the administration of any intoxicating drug. Besides this, our normal mental life exhibits oscillations between a comparatively easy liberation of pleasure and a comparatively difficult one, parallel with which there goes a diminished or an increased receptivity to unpleasure. It is greatly to be regretted that this toxic side of mental processes has so far escaped scientific examination. The service rendered by intoxicating media in the struggle for happiness and in keeping misery at a distance is so highly prized as a benefit that individuals and peoples alike have given them an established place in the economics of their libido. We owe to such media not merely the immediate yield of pleasure, but also a greatly desired degree of independence from the external world. For one knows that, with the help of this 'drowner of cares' one can at any time withdraw from the pressure of reality and find refuge in a world of one's own with better conditions of sensibility. As is well known, it is precisely this property of intoxicants which also determines their danger and their injuriousness. They are responsible, in certain circumstances, for the useless waste of a large quota of energy which might have been employed for the improvement of the human lot.

The complicated structure of our mental apparatus admits, however, of a whole number of other influences. Just as a satisfaction of instinct spells happiness for us, so severe suffering is caused us if the external world lets us starve, if it refuses to sate our needs. One may therefore hope to be freed from a part of one's sufferings by influencing the instinctual impulses. This type of defence against suffering is no longer brought to bear on the sensory apparatus; it seeks to master the internal sources of our needs. The extreme form of this is brought about by killing off the instincts, as is prescribed by the worldly wisdom of the East and practised by Yoga. If it succeeds, then the subject has, it is true, given up all other activities as well - he has sacrificed his life; and, by another path, he has once more only achieved the happiness of quietness. We follow the same path when our aims are less extreme and we merely attempt to *control* our instinctual life. In that case, the controlling elements are the higher psychical agencies, which have subjected themselves to the reality principle. Here the aim of satisfaction is not by any means relinquished; but a certain amount of protection against suffering is secured, in that non-satisfaction is not so painfully felt in the case of instincts kept in dependence as in the case of uninhibited ones. As against this, there is an undeniable diminution in the potentialities of enjoyment. The feeling of happiness derived from the satisfaction of a wild instinctual impulse untamed by the ego is incomparably more intense than that derived from sating an instinct that has been tamed. The irresistibility of perverse instincts, and perhaps the attraction in general of forbidden things, finds an economic explanation here.

Another technique for fending off suffering is the employment of the displacements of libido which our mental apparatus permits of and through which its function gains so much in flexibility. The task here is that of shifting the instinctual aims in such a way that they cannot come up against frustration from the external world. In this, sublimation of the instincts lends its assistance. One gains the most if one can sufficiently heighten the yield of pleasure from the sources of psychical and intellectual work. When that is so, fate can do little against one. A satisfaction of this kind, such as an artist's joy in creating, in giving his phantasies body, or a scientist's in solving problems or discovering truths, has a special quality which we shall certainly one day be able to characterize in metapsychological terms. At present we can only say figuratively that such satisfactions seem 'finer and higher'. But their intensity is mild as compared with that derived from the sating of crude and primary instinctual impulses; it does not convulse our physical being. And the weak point of this method is that it is not applicable generally: it is accessible to only a few people. It presupposes the possession of special dispositions and gifts which are far from being common to any practical degree. And even to the few who do possess them, this method cannot give complete protection from suffering. It creates no impenetrable armour against the arrows of fortune, and it habitually fails when the source of suffering is a person's own body.¹

¹ When there is no special disposition in a person which imperatively prescribes what direction his interests in life shall take, the ordinary professional work that is open to everyone can play the part assigned to it by Voltaire's wise advice. It is not possible, within the limits of a short survey, to discuss adequately the significance of work for the economics of the libido. No other technique for the conduct of life attaches the individual so firmly to reality as laying emphasis on work; for his work at least gives him a secure place in a portion of reality, in the human community. The possibility it offers of displacing a large amount of libidinal components, whether narcissistic, aggressive or even erotic, on to professional work and on to the human relations connected with it lends it a value by no means second to what it enjoys as something indispensable to the preservation and justification of existence in society. Professional activity is a source of special satisfaction if it is a freely chosen one - if, that is to say, by means of sublimation, it makes possible the use of existing inclinations, of persisting or constitutionally reinforced instinctual impulses. And yet, as a path to happiness, work is not highly prized by men. They do not strive after it as they do after other possibilities of satisfaction. The great majority of people only work under the stress of necessity, and this natural human aversion to work raises most difficult social problems.

While this procedure already clearly shows an intention of making oneself independent of the external world by seeking satisfaction in internal, psychical processes, the next procedure brings out those features yet more strongly. In it, the connection with reality is still further loosened; satisfaction is obtained from illusions, which are recognized as such without the discrepancy between them and reality being allowed to interfere with enjoyment. The region from which these illusions arise is the life of the imagination; at the time when the development of the sense of reality took place, this region was expressly exempted from the demands of reality-testing and was set apart for the purpose of fulfilling wishes which were difficult to carry out. At the head of these satisfactions through phantasy stands the enjoyment of works of art - an enjoyment which, by the agency of the artist, is made accessible even to those who are not themselves creative.¹ People who are receptive to the influence of art cannot set too high a value on it as a source of pleasure and consolation in life. Nevertheless the mild narcosis induced in us by art can do no more than bring about a transient withdrawal from the pressure of vital needs, and it is not strong enough to make us forget real misery.

Another procedure operates more energetically and more thoroughly. It regards reality as the sole enemy and as the source of all suffering, with which it is impossible to live, so that one must break off all relations with it if one is to be in any way happy. The hermit turns his back on the world and will have no truck with it. But one can do more than that; one can try to re-create the world, to build up in its stead another world in which its most unbearable features are eliminated and replaced by others that are in conformity with one's own wishes. But whoever, in desperate defiance, sets out upon this path to happiness will as a rule attain nothing. Reality is too strong for him. He becomes a madman, who for the most part finds no one to help him in carrying through his delusion. It is asserted, however, that each one of us behaves in some one respect like a paranoic, corrects some aspect of the world which is unbearable to him by the construction of a wish and introduces this delusion into reality. A special importance attaches to the case in which this attempt to procure a certainty of happiness and a protection against suffering through a delusional remoulding of reality is made by a considerable number of people in common. The religions of mankind must be classed among the mass delusions of this kind. No one, needless to say, who shares a delusion ever recognizes it as such.

¹ Cf. 'Formulations on the Two Principles of Mental Functioning' (1911*b*), and Lecture XXIII of my *Introductory Lectures* (1916-17).

I do not think that I have made a complete enumeration of the methods by which men strive to gain happiness and keep suffering away and I know, too, that the material might have been differently arranged. One procedure I have not yet mentioned - not because I have forgotten it but because it will concern us later in another connection. And how could one possibly forget, of all others, this technique in the art of living? It is conspicuous for a most remarkable combination of characteristic features. It, too, aims of course at making the subject independent of Fate (as it is best to call it), and to that end it locates satisfaction in internal mental processes, making use, in so doing, of the displaceability of the libido of which we have already spoken. But it does not turn away from the external world; on the contrary, it clings to the objects belonging to that world and obtains happiness from an emotional relationship to them. Nor is it content to aim at an avoidance of unpleasure - a goal, as we might call it, of weary resignation; it passes this by without heed and holds fast to the original, passionate striving for a positive fulfilment of happiness. And perhaps it does in fact come nearer to this goal than any other method. I am, of course, speaking of the way of life which makes love the centre of everything, which looks for all satisfaction in loving and being loved. A psychical attitude of this sort comes naturally enough to all of us; one of the forms in which love manifests itself - sexual love - has given us our most intense experience of an overwhelming sensation of pleasure and has thus furnished us with a pattern for our search for happiness. What is more natural than that we should persist in looking for happiness along the path on which we first encountered it? The weak side of this technique of living is easy to see; otherwise no human being would have thought of abandoning this path to happiness for any other. It is that we are never so defenceless against suffering as when we love, never so helplessly unhappy as when we have lost our loved object or its love. But this does not dispose of the technique of living based on the value of love as a means to happiness. There is much more to be said about it.

We may go on from here to consider the interesting case in which happiness in life is predominantly sought in the enjoyment of beauty, wherever beauty presents itself to our senses and our judgement - the beauty of human forms and gestures, of natural objects and landscapes and of artistic and even scientific creations. This aesthetic attitude to the goal of life offers little protection against the threat of suffering, but it can compensate for a great deal. The enjoyment of beauty has a peculiar, mildly intoxicating quality of feeling. Beauty has no obvious use; nor is there any clear cultural necessity for it. Yet civilization could not do without it. The science of aesthetics investigates the conditions under which things are felt as beautiful, but it has been unable to give any explanation of the nature and origin of beauty, and, as usually happens, lack of success is concealed beneath a flood of resounding and empty words. Psycho-analysis, unfortunately, has scarcely anything to say about beauty either. All that seems certain is its derivation from the field of sexual feeling. The love of beauty seems a perfect example of an impulse inhibited in its aim. 'Beauty' and 'attraction' are originally attributes of the sexual object. It is worth remarking that the genitals themselves, the sight of which is always exciting, are nevertheless hardly ever judged to be beautiful; the quality of beauty seems, instead, to attach to certain secondary sexual characters.

In spite of the incompleteness, I will venture on a few remarks as a conclusion to our enquiry. The programme of becoming happy, which the pleasure principle imposes on us, cannot be fulfilled; yet we must not - indeed, we cannot - give up our efforts to bring it nearer to fulfilment by some means or other. Very different paths may be taken in that direction, and we may give priority either to the positive aspect of the aim, that of gaining pleasure, or to its negative one, that of avoiding unpleasure. By none of these paths can we attain all that we desire. Happiness, in the reduced sense in which we recognize it as possible, is a problem of the economics of the individual's libido. There is no golden rule which applies to everyone: every man must find out for himself in what particular fashion he can be saved. All kinds of different factors will operate to direct his choice. It is a question of how much real satisfaction he can expect to get from the external world, how far he is led to make himself independent of it, and, finally, how much strength he feels he has for altering the world to suit his wishes. In this, his psychical constitution will play a decisive part, irrespectively of the external circumstances. The man who is predominantly erotic will give first preference to his emotional relationships to other people; the narcissistic man, who inclines to be self-sufficient, will seek his main satisfactions in his internal mental processes; the man of action will never give up the external world on which he can try out his strength. As regards the second of these types, the nature of his talents and the amount of instinctual sublimation open to him will decide where he shall locate his interests. Any choice that is pushed to an extreme will be penalized by exposing the individual to the dangers which arise if a technique of living that has been chosen as an exclusive one should prove inadequate. Just as a cautious business-man avoids tying up all his capital in one concern, so, perhaps, worldly wisdom will advise us not to look for the whole of our satisfaction from a single aspiration. Its success is never certain, for that depends on the convergence of many factors, perhaps on none more than on the capacity of the psychical constitution to adapt its function to the environment and then to exploit that environment for a yield of pleasure. A person who is born with a specially unfavourable instinctual constitution, and who has not properly undergone the transformation and rearrangement of his libidinal components which is indispensable for later achievements, will find it hard to obtain happiness from his external situation, especially if he is faced with tasks of some difficulty. As a last technique of living, which will at least bring him substitutive satisfactions, he is offered that of a flight into neurotic illness - a flight which he usually accomplishes when he is still young. The man who sees his pursuit of happiness come to nothing in later years can still find consolation in the yield of pleasure of chronic intoxication; or he can embark on the desperate attempt at rebellion seen in a psychosis.¹

¹ I feel impelled to point out one at least of the gaps that have been left in the account given above. No discussion of the possibilities of human happiness should omit to take into consideration the relation between narcissism and object libido. We require to know what being essentially self-dependent signifies for the economics of the libido.

Religion restricts this play of choice and adaptation, since it imposes equally on everyone its own path to the acquisition of happiness and protection from suffering. Its technique consists in depressing the value of life and distorting the picture of the real world in a delusional manner - which presupposes an intimidation of the intelligence. At this price, by forcibly fixing them in a state of psychical infantilism and by drawing them into a mass-delusion, religion succeeds in sparing many people an individual neurosis. But hardly anything more. There are, as we have said, many paths which *may* lead to such happiness as is attainable by men, but there is none which does so for certain. Even religion cannot keep its promise. If the believer finally sees himself obliged to speak of God's 'inscrutable decrees', he is admitting that all that is left to him as a last possible consolation and source of pleasure in his suffering is an unconditional submission. And if he is prepared for that, he could probably have spared himself the *détour* he has made.

III

Our enquiry concerning happiness has not so far taught us much that is not already common knowledge. And even if we proceed from it to the problem of why it is so hard for men to be happy, there seems no greater prospect of learning anything new. We have given the answer already by pointing to the three sources from which our suffering comes: the superior power of nature, the feebleness of our own bodies and the inadequacy of the regulations which adjust the mutual relations of human beings in the family, the state and society. In regard to the first two sources, our judgement cannot hesitate long. It forces us to acknowledge those sources of suffering and to submit to the inevitable. We shall never completely master nature; and our bodily organism, itself a part of that nature, will always remain a transient structure with a limited capacity for adaptation and achievement. This recognition does not have a paralysing effect. On the contrary, it points the direction for our activity. If we cannot remove all suffering, we can remove some, and we can mitigate some: the experience of many thousands of years has convinced us of that. As regards the third source, the social source of suffering, our attitude is a different one. We do not admit it at all; we cannot see why the regulations made by ourselves should not, on the contrary, be a protection and a benefit for every one of us. And yet, when we consider how unsuccessful we have been in precisely this field of prevention of suffering, a suspicion dawns on us that here, too, a piece of unconquerable nature may lie behind it - this time a piece of our own psychical constitution.

When we start considering this possibility, we come upon a contention which is so astonishing that we must dwell upon it. This contention holds that what we call our civilization is largely responsible for our misery, and that we should be much happier if we gave it up and returned to primitive conditions. I call this contention astonishing because, in whatever way we may define the concept of civilization, it is a certain fact that all the things with which we seek to protect ourselves against the threats that emanate from the sources of suffering are part of that very civilization.

How has it happened that so many people have come to take up this strange attitude of hostility to civilization? I believe that the basis of it was a deep and long-standing dissatisfaction with the then existing state of civilization and that on that basis a condemnation of it was built up, occasioned by certain specific historical events. I think I know what the last and the last but one of those occasions were. I am not learned enough to trace the chain of them far back enough in the history of the human species; but a factor of this kind hostile to civilization must already have been at work in the victory of Christendom over the heathen religions. For it was very closely related to the low estimation put upon earthly life by the Christian doctrine. The last but one of these occasions was when the progress of voyages of discovery led to contact with primitive peoples and races. In consequence of insufficient observation and a mistaken view of their manners and customs, they appeared to Europeans to be leading a simple, happy life with few wants, a life such as was unattainable by their visitors with their superior civilization. Later experience has corrected some of those judgements. In many cases the observers had wrongly attributed to the absence of complicated cultural demands what was in fact due to the bounty of nature and the ease with which the major human needs were satisfied. The last occasion is especially familiar to us. It arose when people came to know about the mechanism of the neuroses, which threaten to undermine the modicum of happiness enjoyed by civilized men. It was discovered that a person becomes neurotic because he cannot tolerate the amount of frustration which society imposes on him in the service of its cultural ideals, and it was inferred from this that the abolition or reduction of those demands would result in a return to possibilities of happiness.

There is also an added factor of disappointment. During the last few generations mankind has made an extraordinary advance in the natural sciences and in their technical application and has established his control over nature in a way never before imagined. The single steps of this advance are common knowledge and it is unnecessary to enumerate them. Men are proud of those achievements, and have a right to be. But they seem to have observed that this newly-won power over space and time, this subjugation of the forces of nature, which is the fulfilment of a longing that goes back thousands of years, has not increased the amount of pleasurable satisfaction which they may expect from life and has not made them feel happier. From the recognition of this fact we ought to be content to conclude that power over nature is not the *only* precondition of human happiness, just as it is not the *only* goal of cultural endeavour; we ought not to infer from it that technical progress is without value for the economics of our happiness. One would like to ask: is there, then, no positive gain in pleasure, no unequivocal increase in my feeling of happiness, if I can, as often as I please, hear the voice of a child of mine who is living hundreds of miles away or if I can learn in the shortest possible time after a friend has reached his destination that he has come through the long and difficult voyage unharmed? Does it mean nothing that medicine has succeeded in enormously reducing infant mortality and the danger of infection for women in childbirth, and, indeed, in considerably lengthening the average life of a civilized man? And there is a long list that might be Added to benefits of this kind which we owe to the much-despised era of scientific and technical advances. But here the voice of pessimistic criticism makes itself heard and warns us that most of these satisfactions follow the model of the 'cheap enjoyment' extolled in the anecdote - the enjoyment obtained by putting a bare leg from under the bedclothes on a cold winter night and drawing it in again. If there had been no railway to conquer distances, my child would never have left his native town and I should need no telephone to hear his voice; if travelling across the ocean by ship had not been introduced, my friend would not have embarked on his sea-voyage and I should not need a cable to relieve my anxiety about him. What is the use of reducing infantile mortality when it is precisely that reduction which imposes the greatest restraint on us in the begetting of children, so that, taken all round, we nevertheless rear no more children than in the days before the reign of hygiene, while at the same time we have created difficult conditions for our sexual life in marriage, and have probably worked against the beneficial effects of natural selection? And, finally, what good to us is a long life if it is difficult and barren of joys, and if it is so full of misery that we can only welcome death as a deliverer?

It seems certain that we do not feel comfortable in our present-day civilization, but it is very difficult to form an opinion whether and in what degree men of an earlier age felt happier and what part their cultural conditions played in the matter. We shall always tend to consider people's distress objectively - that is, to place ourselves, with our own wants and sensibilities, in *their* conditions, and then to examine what occasions we should find in them for experiencing happiness or unhappiness. This method of looking at things, which seems objective because it ignores the variations in subjective sensibility, is, of course, the most subjective possible, since it puts one's own mental states in the place of any others, unknown though they may be. Happiness, however, is something essentially subjective. No matter how much we may shrink with horror from certain situations - of a galley-slave in antiquity, of a peasant during the Thirty Years' War, of a victim of the Holy Inquisition, of a Jew awaiting a pogrom - it is nevertheless impossible for us to feel our way into such people - to divine the changes which original obtuseness of mind, a gradual stupefying process, the cessation of expectations, and cruder or more refined methods of narcotization have produced upon their receptivity to sensations of pleasure and unpleasure. Moreover, in the case of the most extreme possibility of suffering, special mental protective devices are brought into operation. It seems to me unprofitable to pursue this aspect of the problem any further.

It is time for us to turn our attention to the nature of this civilization on whose value as a means to happiness doubts have been thrown. We shall not look for a formula in which to express that nature in a few words, until we have learned something by examining it. We shall therefore content ourselves with saying once more that the word 'civilization' describes the whole sum of the achievements and the regulations which distinguish our lives from those of our animal ancestors and which serve two purposes - namely to protect men against nature and to adjust their mutual relations.¹ In order to learn more, we will bring together the various features of civilization individually, as they are exhibited in human communities. In doing so, we shall have no hesitation in letting ourselves be guided by linguistic usage or, as it is also called, linguistic feeling, in the conviction that we shall thus be doing justice to inner discernments which still defy expression in abstract terms.

¹ See *The Future of an Illusion* (1927c).

The first stage is easy. We recognize as cultural all activities and resources which are useful to men for making the earth serviceable to them, for protecting them against the violence of the forces of nature, and so on. As regards this side of civilization, there can be scarcely any doubt. If we go back far enough, we find that the first acts of civilization were the use of tools, the gaining of control over fire and the construction of dwellings. Among these, the control over fire stands out as a quite extraordinary and unexampled achievement,¹ while the others opened up paths which man has followed ever since, and the stimulus to which is easily guessed. With every tool man is perfecting his own organs, whether motor or sensory, or is removing the limits to their functioning. Motor power places gigantic forces at his disposal, which, like his muscles, he can employ in any direction; thanks to ships and aircraft neither water nor air can hinder his movements; by means of spectacles he corrects defects in the lens of his own eye; by means of the telescope he sees into the far distance; and by means of the microscope he overcomes the limits of visibility set by the structure of his retina. In the photographic camera he has created an instrument which retains the fleeting visual impressions, just as a gramophone disc retains the equally fleeting auditory ones; both are at bottom materializations of the power he possesses of recollection, his memory. With the help of the telephone he can hear at distances which would be respected as unattainable even in a fairy tale. Writing was in its origin the voice of an absent person; and the dwelling-house was a substitute for the mother's womb, the first lodging, for which in all likelihood man still longs, and in which he was safe and felt at ease.

¹ Psycho-analytic material, incomplete as it is and not susceptible to clear interpretation, nevertheless admits of a conjecture - a fantastic sounding one - about the origin of this human feat. It is as though primal man had the habit, when he came in contact with fire, or satisfying an infantile desire connected with it, by putting it out with a stream of his urine. The legends that we possess leave no doubt about the originally phallic view taken of tongues of flame as they shoot upwards. Putting out fire by micturating - a theme to which modern giants, Gulliver in Lilliput and Rabelais' Gargantua, still hark back - was therefore a kind of sexual act with a male, an enjoyment of sexual potency in a homosexual competition. The first person to renounce this desire and spare the fire was able to carry it off with him and subdue it to his own use. By damping down the fire of his own sexual excitation, he had tamed the natural force of fire. This great cultural conquest was thus the reward for his renunciation of instinct. Further, it is as though woman had been appointed guardian of the fire which was held captive on the domestic hearth, because her anatomy made it impossible for her to yield to the temptation of this desire. It is remarkable, too, how regularly analytic experience testifies to the connection between ambition, fire and urethral erotism.

These things that, by his science and technology, man has brought about on this earth, on which he first appeared as a feeble animal organism and on which each individual of his species must once more make its entry ('oh inch of nature!') as a helpless suckling - these things do not only sound like a fairy tale, they are an actual fulfilment of every - or of almost every - fairy-tale wish. All these assets he may lay claim to as his cultural acquisition. Long ago he formed an ideal conception of omnipotence and omniscience which he embodied in his gods. To these gods he attributed everything that seemed unattainable to his wishes, or that was forbidden to him. One may say, therefore, that these gods were cultural ideals. To-day he has come very close to the attainment of this ideal, he has almost become a god himself. Only, it is true, in the fashion in which ideals are usually attained according to the general judgement of humanity. Not completely; in some respects not at all, in others only half way. Man has, as it were, become a kind of prosthetic God. When he puts on all his auxiliary organs he is truly magnificent; but those organs have not grown on to him and they still give him much trouble at times. Nevertheless, he is entitled to console himself with the thought that this development will not come to an end precisely with the year 1930 A.D. Future ages will bring with them new and probably unimaginably great advances in this field of civilization and will increase man's likeness to God still more. But in the interests of our investigations, we will not forget that present-day man does not feel happy in his Godlike character.

We recognize, then, that countries have attained a high level of civilization if we find that in them everything which can assist in the exploitation of the earth by man and in his protection against the forces of nature - everything, in short, which is of use to him - is attended to and effectively carried out. In such countries rivers which threaten to flood the land are regulated in their flow, and their water is directed through canals to places where there is a shortage of it. The soil is carefully cultivated and planted with the vegetation which it is suited to support; and the mineral wealth below ground is assiduously brought to the surface and fashioned into the required implements and utensils. The means of communication are ample, rapid and reliable. Wild and dangerous animals have been exterminated, and the breeding of domesticated animals flourishes. But we demand other things from civilization besides these, and it is a noticeable fact that we hope to find them realized in these same countries. As though we were seeking to repudiate the first demand we made, we welcome it as a sign of civilization as well if we see people directing their care too to what has no practical value whatever, to what is useless - if, for instance, the green spaces necessary in a town as playgrounds and as reservoirs of fresh air are also laid out with flower-beds, or if the windows of the houses are decorated with pots of flowers. We soon observe that this useless thing which we expect civilization to value is beauty. We require civilized man to reverence beauty wherever he sees it in nature and to create it in the objects of his handiwork so far as he is able. But this is far from exhausting our demands on civilization. We expect besides to see the signs of cleanliness and order. We do not think highly of the cultural level of an English country town in Shakespeare's time when we read that there was a big dung heap in front of his father's house in Stratford; we are indignant and call it 'barbarous' (which is the opposite of civilized) when we find the paths in the Wiener Wald littered with paper. Dirtiness of any kind seems to us incompatible with civilization. We extend our demand for cleanliness to the human body too. We are astonished to learn of the objectionable smell which emanated from the *Roi Soleil*; and we shake our heads on the Isola Bella when we are shown the tiny wash-basin in which Napoleon made his morning toilet. Indeed, we are not surprised by the idea of setting up the use of soap as an actual yardstick of civilization. The same is true of order. It, like cleanliness, applies solely to the works of man. But whereas cleanliness is not to be expected in nature, order, on the contrary, has been imitated from her. Man's observation of the great astronomical regularities not only furnished him with a model for introducing order into his life, but gave him the first points of departure for doing so. Order is a kind of compulsion to repeat which, when a regulation has been laid down once and for all, decides when, where and how a thing shall be done, so that in every similar circumstance one is spared hesitation and indecision. The benefits of order are incontestable. It enables men to use space and time to the best advantage, while conserving their psychical forces. We should have a right to expect that order would have taken its place in human activities from the start and without difficulty; and we may well wonder that this has not happened - that, on the contrary, human beings exhibit an inborn tendency to carelessness, irregularity and unreliability in their work, and that a laborious training is needed before they learn to follow the example of their celestial models.

Beauty, cleanliness and order obviously occupy a special position among the requirements of civilization. No one will maintain that they are as important for life as control over the forces of nature or as some other factors with which we shall become acquainted. And yet no one would care to put them in the background as trivialities. That civilization is not exclusively taken up with what is useful is already shown by the example of beauty, which we decline to omit from among the interests of civilization. The usefulness of order is quite evident. With regard to cleanliness, we must bear in mind that it is demanded of us by hygiene as well, and we may suspect that even before the days of scientific prophylaxis the connection between the two was not altogether strange to man. Yet utility does not entirely explain these efforts; something else must be at work besides.

No feature, however, seems better to characterize civilization than its esteem and encouragement of man's higher mental activities - his intellectual, scientific and artistic achievements and the leading role that it assigns to ideas in human life. Foremost among those ideas are the religious systems, on whose complicated structure I have endeavoured to throw light elsewhere. Next come the speculations of philosophy; and finally what might be called man's 'ideals' - his ideas of a possible perfection of individuals, or of peoples or of the whole of humanity, and the demands he sets up on the basis of such ideas. The fact that these creations of his are not independent of one another, but are on the contrary closely interwoven, increases the difficulty not only of describing them but of tracing their psychological derivation. If we assume quite generally that the motive force of all human activities is a striving towards the two confluent goals of utility and a yield of pleasure, we must suppose that this is also true of the manifestations of civilization which we have been discussing here, although this is easily visible only in scientific and aesthetic activities. But it cannot be doubted that the other activities, too, correspond to strong needs in men - perhaps to needs which are only developed in a minority. Nor must we allow ourselves to be misled by judgements of value concerning any particular religion, or philosophic system, or ideal. Whether we think to find in them the highest achievements of the human spirit, or whether we deplore them as aberrations, we cannot but recognize that where they are present, and, in especial, where they are dominant, a high level of civilization is implied.

The last, but certainly not the least important, of the characteristic features of civilization remains to be assessed: the manner in which the relationships of men to one another, their social relationships, are regulated - relationships which affect a person as a neighbour, as a source of help, as another person's sexual object, as a member of a family and of a State. Here it is especially difficult to keep clear of particular ideal demands and to see what is civilized in general. Perhaps we may begin by explaining that the element of civilization enters on the scene with the first attempt to regulate these social relationships. If the attempt were not made, the relationships would be subject to the arbitrary will of the individual: that is to say, the physically stronger man would decide them in the sense of his own interests and instinctual impulses. Nothing would be changed in this if this stronger man should in his turn meet someone even stronger than he. Human life in common is only made possible when a majority comes together which is stronger than any separate individual and which remains united against all separate individuals. The power of this community is then set up as 'right' in opposition to the power of the individual, which is condemned as 'brute force'. This replacement of the power of the individual by the power of a community constitutes the decisive step of civilization. The essence of it lies in the fact that the members of the community restrict themselves in their possibilities of satisfaction, whereas the individual knew no such restrictions. The first requisite of civilization, therefore, is that of justice - that is, the assurance that a law once made will not be broken in favour of an individual. This implies nothing as to the ethical value of such a law. The further course of cultural development seems to tend towards making the law no longer an expression of the will of a small community - a caste or a stratum of the population or a racial group - which, in its turn, behaves like a violent individual towards other, and perhaps more numerous, collections of people. The final outcome should be a rule of law to which all - except those who are not capable of entering a community - have contributed by a sacrifice of their instincts, and which leaves no one - again with the same exception - at the mercy of brute force.

The liberty of the individual is no gift of civilization. It was greatest before there was any civilization, though then, it is true, it had for the most part no value, since the individual was scarcely in a position to defend it. The development of civilization imposes restrictions on it, and justice demands that no one shall escape those restrictions. What makes itself felt in a human community as a desire for freedom may be their revolt against some existing injustice, and so may prove favourable to a further development of civilization; it may remain compatible with civilization. But it may also spring from the remains of their original personality, which is still untamed by civilization and may thus become the basis in them of hostility to civilization. The urge for freedom, therefore, is directed against particular forms and demands of civilization or against civilization altogether. It does not seem as though any influence could induce a man to change his nature into a termite's. No doubt he will always defend his claim to individual liberty against the will of the group. A good part of the struggles of mankind centre round the single task of finding an expedient accommodation - one, that is, that will bring happiness - between this claim of the individual and the cultural claims of the group; and one of the problems that touches the fate of humanity is whether such an accommodation can be reached by means of some particular form of civilization or whether this conflict is irreconcilable.

By allowing common feeling to be our guide in deciding what features of human life are to be regarded as civilized, we have obtained a clear impression of the general picture of civilization; but it is true that so far we have discovered nothing that is not universally known. At the same time we have been careful not to fall in with the prejudice that civilization is synonymous with perfecting, that it is the road to perfection pre-ordained for men. But now a point of view presents itself which may lead in a different direction. The development of civilization appears to us as a peculiar process which mankind undergoes, and in which several things strike us as familiar. We may characterize this process with reference to the changes which it brings about in the familiar instinctual dispositions of human beings, to satisfy which is, after all, the economic task of our lives. A few of these instincts are used up in such a manner that something appears in their place which, in an individual, we describe as a character-trait. The most remarkable example of such a process is found in the anal erotism of young human beings. Their original interest in the excretory function, its organs and products, is changed in the course of their growth into a group of traits which are familiar to us as parsimony, a sense of order and cleanliness - qualities which, though valuable and welcome in themselves, may be intensified till they become markedly dominant and produce what is called the anal character. How this happens we do not know, but there is no doubt about the correctness of the finding.¹ Now we have seen that order and cleanliness are important requirements of civilization, although their vital necessity is not very apparent, any more than their suitability as sources of enjoyment. At this point we cannot fail to be struck by the similarity between the process of civilization and the libidinal development of the individual. Other instincts are induced to displace the conditions for their satisfaction, to lead them into other paths. In most cases this process coincides with that of the *sublimation* (of instinctual aims) with which we are familiar, but in some it can be differentiated from it. Sublimation of instinct is an especially conspicuous feature of cultural development; it is what makes it possible for higher psychical activities, scientific, artistic or ideological, to play such an important part in civilized life. If one were to yield to a first impression, one would say that sublimation is a vicissitude which has been forced upon the instincts entirely by civilization. But it would be wiser to reflect upon this a little longer. In the third place, finally, and this seems the most important of all, it is impossible to overlook the extent to which civilization is built up upon a renunciation of instinct, how much it presupposes precisely the non-satisfaction (by suppression, repression or some other means?) of powerful instincts. This 'cultural frustration' dominates the large field of social relationships between human beings. As we already know, it is the cause of the hostility against which all civilizations have to struggle. It will also make severe demands on our scientific work, and we shall have much to explain here. It is not easy to understand how it can become possible to deprive an instinct of satisfaction. Nor is doing so without danger. If the loss is not compensated for economically, one can be certain that serious disorders will ensue.

But if we want to know what value can be attributed to our view that the development of civilization is a special process, comparable to the normal maturation of the individual, we must clearly attack another problem. We must ask ourselves to what influences the development of civilization owes its origin, how it arose, and by what its course has been determined.

¹ Cf. my 'Character and Anal Erotism' (1908*b*), and numerous further contributions, by Ernest Jones and others.

IV

The task seems an immense one, and it is natural to feel diffidence in the face of it. But here are such conjectures as I have been able to make.

After primal man had discovered that it lay in his own hands, literally, to improve his lot on earth by working, it cannot have been a matter of indifference to him whether another man worked with or against him. The other man acquired the value for him of a fellow-worker, with whom it was useful to live together. Even earlier, in his ape-like prehistory, man had adopted the habit of forming families, and the members of his family were probably his first helpers. One may suppose that the founding of families was connected with the fact that a moment came when the need for genital satisfaction no longer made its appearance like a guest who drops in suddenly, and, after his departure, is heard of no more for a long time, but instead took up its quarters as a permanent lodger. When this happened, the male acquired a motive for keeping the female, or, speaking more generally, his sexual objects, near him; while the female, who did not want to be separated from her helpless young, was obliged, in their interests, to remain with the stronger male.¹ In this primitive family one essential feature of civilization is still lacking. The arbitrary will of its head, the father, was unrestricted. In *Totem and Taboo* I have tried to show how the way led from this family to the succeeding stage of communal life in the form of bands of brothers. In overpowering their father, the sons had made the discovery that a combination can be stronger than a single individual. The totemic culture is based on the restrictions which the sons had to impose on one another in order to keep this new state of affairs in being. The taboo-observances were the first 'right' or 'law'. The communal life of human beings had, therefore, a two-fold foundation: the compulsion to work, which was created by external necessity, and the power of love, which made the man unwilling to be deprived of his sexual object - the woman -, and made the woman unwilling to be deprived of the part of herself which had been separated off from her - her child. Eros and Ananke have become the parents of human civilization too. The first result of civilization was that even a fairly large number of people were now able to live together in a community. And since these two great powers were co-operating in this, one might expect that the further development of civilization would proceed smoothly towards an even better control over the external world and towards a further extension of the number of people included in the community. Nor is it easy to understand how this civilization could act upon its participants otherwise than to make them happy.

¹ The organic periodicity of the sexual process has persisted, it is true, but its effect on psychical sexual excitation has rather been reversed. This change seems most likely to be connected with the diminution of the olfactory stimuli by means of which the menstrual process produced an effect on the male psyche. Their role was taken over by visual excitations, which, in contrast to the intermittent olfactory stimuli, were able to maintain a permanent effect. The taboo on menstruation is derived from this 'organic repression', as a defence against a phase of development that has been surmounted. All other motives are probably of a secondary nature. (Cf. C. D. Daly, 1927.) This process is repeated on another level when the gods of a superseded period of civilization turn into demons. The diminution of the olfactory stimuli seems itself to be a consequence of man's raising himself from the ground, of his assumption of an upright gait; this made his genitals, which were previously concealed, visible and in need of protection, and so provoked feelings of shame in him.

The fateful process of civilization would thus have set in with man's adoption of an erect posture. From that point the chain of events would have proceeded through the devaluation of olfactory stimuli and the isolation of the menstrual period to the time when visual stimuli were paramount and the genitals became visible, and thence to the continuity of sexual excitation, the founding of the family and so to the threshold of human civilization. This is only a theoretical speculation, but it is important enough to deserve careful checking with reference to the conditions of life which obtain among animals closely related to man.

A social factor is also unmistakably present in the cultural trend towards cleanliness, which has received *ex post facto* justification in hygienic considerations but which manifested itself before their discovery. The incitement to cleanliness originates in an urge to get rid of the excreta, which have become disagreeable to the sense perceptions. We know that in the nursery things are different. The excreta arouse no disgust in children. They seem valuable to them as being a part of their own body which has come away from it. Here upbringing insists with special energy on hastening the course of development which lies ahead, and which should make the excreta worthless, disgusting, abhorrent and abominable. Such a reversal of values would scarcely be possible if the substances that are expelled from the body were not doomed by their strong smells to share the fate which overtook olfactory stimuli after man adopted the erect posture. Anal erotism, therefore, succumbs in the first instance to the 'organic repression' which paved the way to civilization. The existence of the social factor which is responsible for the further transformation of anal erotism is attested by the circumstance that, in spite of all man's developmental advances, he scarcely finds the smell of *his own* excreta repulsive, but only that of other people's. Thus a person who is not clean - who does not hide his excreta - is offending other people; he is showing no consideration for them. And this is confirmed by our strongest and commonest terms of abuse. It would be incomprehensible, too, that man should use the name of his most faithful friend in the animal world - the dog - as a term of abuse if that creature had not incurred his contempt through two characteristics:

Civilization And Its Discontents

that it is an animal whose dominant sense is that of smell and one which has no horror of excrement, and that it is not ashamed of its sexual functions.

Before we go on to enquire from what quarter an interference might arise, this recognition of love as one of the foundations of civilization may serve as an excuse for a digression which will enable us to fill in a gap which we left in an earlier discussion. We said there that man's discovery that sexual (genital) love afforded him the strongest experiences of satisfaction, and in fact provided him with the prototype of all happiness, must have suggested to him that he should continue to seek the satisfaction of happiness in his life along the path of sexual relations and that he should make genital erotism the central point of his life. We went on to say that in doing so he made himself dependent in a most dangerous way on a portion of the external world, namely, his chosen love-object, and exposed himself to extreme suffering if he should be rejected by that object or should lose it through unfaithfulness or death. For that reason the wise men of every age have warned us most emphatically against this way of life; but in spite of this it has not lost its attraction for a great number of people.

A small minority are enabled by their constitution to find happiness, in spite of everything, along the path of love. But far-reaching mental changes in the function of love are necessary before this can happen. These people make themselves independent of their object's acquiescence by displacing what they mainly value from being loved on to loving; they protect themselves against the loss of the object by directing their love, not to single objects but to all men alike; and they avoid the uncertainties and disappointments of genital love by turning away from its sexual aims and transforming the instinct into an impulse with an *inhibited aim*. What they bring about in themselves in this way is a state of evenly suspended, steadfast, affectionate feeling, which has little external resemblance any more to the stormy agitations of genital love, from which it is nevertheless derived. Perhaps St. Francis of Assisi went furthest in thus exploiting love for the benefit of an inner feeling of happiness. Moreover, what we have recognized as one of the techniques for fulfilling the pleasure principle has often been brought into connection with religion; this connection may lie in the remote regions where the distinction between the ego and objects or between objects themselves is neglected. According to one ethical view, whose deeper motivation will become clear to us presently, this readiness for a universal love of mankind and the world represents the highest standpoint which man can reach. Even at this early stage of the discussion I should like to bring forward my two main objections to this view. A love that does not discriminate seems to me to forfeit a part of its own value, by doing an injustice to its object; and secondly, not all men are worthy of love.

The love which founded the family continues to operate in civilization both in its original form, in which it does not renounce direct sexual satisfaction, and in its modified form as aim-inhibited affection. In each, it continues to carry on its function of binding together considerable numbers of people, and it does so in a more intensive fashion than can be effected through the interest of work in common. The careless way in which language uses the word 'love' has its genetic justification. People give the name 'love' to the relation between a man and a woman whose genital needs have led them to found a family; but they also give the name 'love' to the positive feelings between parents and children, and between the brothers and sisters of a family, although we are obliged to describe this as 'aim-inhibited love' or 'affection'. Love with an inhibited aim was in fact originally fully sensual love, and it is so still in man's unconscious. Both - fully sensual love and aim-inhibited love - extend outside the family and create new bonds with people who before were strangers. Genital love leads to the formation of new families, and aim-inhibited love to 'friendships' which become valuable from a cultural standpoint because they escape some of the limitations of genital love, as, for instance, its exclusiveness. But in the course of development the relation of love to civilization loses its unambiguity. On the one hand love comes into opposition to the interests of civilization; on the other, civilization threatens love with substantial restrictions.

This rift between them seems unavoidable. The reason for it is not immediately recognizable. It expresses itself at first as a conflict between the family and the larger community to which the individual belongs. We have already perceived that one of the main endeavours of civilization is to bring people together into large unities. But the family will not give the individual up. The more closely the members of a family are attached to one another, the more often do they tend to cut themselves off from others, and the more difficult is it for them to enter into the wider circle of life. The mode of life in common which is phylogenetically the older, and which is the only one that exists in childhood, will not let itself be superseded by the cultural mode of life which has been acquired later. Detaching himself from his family becomes a task that faces every young person, and society often helps him in the solution of it by means of puberty and initiation rites. We get the impression that these are difficulties which are inherent in all psychical - and, indeed, at bottom, in all organic - development.

Furthermore, women soon come into opposition to civilization and display their retarding and restraining influence - those very women who, in the beginning, laid the foundations of civilization by the claims of their love. Women represent the interests of the family and of sexual life. The work of civilization has become increasingly the business of men, it confronts them with ever more difficult tasks and compels them to carry out instinctual sublimations of which women are little capable. Since a man does not have unlimited quantities of psychical energy at his disposal, he has to accomplish his tasks by making an expedient distribution of his libido. What he employs for cultural aims he to a great extent withdraws from women and sexual life. His constant association with men, and his dependence on his relations with them, even estrange him from his duties as a husband and father. Thus the woman finds herself forced into the background by the claims of civilization and she adopts a hostile attitude towards it.

The tendency on the part of civilization to restrict sexual life is no less clear than its other tendency to expand the cultural unit. Its first, totemic, phase already brings with it the prohibition against an incestuous choice of object, and this is perhaps the most drastic mutilation which man's erotic life has in all time experienced. Taboos, laws and customs impose further restrictions, which affect both men and women. Not all civilizations go equally far in this; and the economic structure of the society also influences the amount of sexual freedom that remains. Here, as we already know, civilization is obeying the laws of economic necessity, since a large amount of the psychical energy which it uses for its own purposes has to be withdrawn from sexuality. In this respect civilization behaves towards sexuality as a people or a stratum of its population does which has subjected another one to its exploitation. Fear of a revolt by the suppressed elements drives it to stricter precautionary measures. A high-water mark in such a development has been reached in our Western European civilization. A cultural community is perfectly justified, psychologically, in starting by proscribing manifestations of the sexual life of children, for there would be no prospect of curbing the sexual lusts of adults if the ground had not been prepared for it in childhood. But such a community cannot in any way be justified in going to the length of actually *disavowing* such easily demonstrable, and, indeed, striking phenomena. As regards the sexually mature individual, the choice of an object is restricted to the opposite sex, and most extra-genital satisfactions are forbidden as perversions. The requirement, demonstrated in these prohibitions, that there shall be a single kind of sexual life for everyone, disregards the dissimilarities, whether innate or acquired, in the sexual constitution of human beings; it cuts off a fair number of them from sexual enjoyment, and so becomes the source of serious injustice. The result of such restrictive measures might be that in people who are normal - who are not prevented by their constitution - the whole of their sexual interests would flow without loss into the channels that are left open. But heterosexual genital love, which has remained exempt from outlawry, is itself restricted by further limitations, in the shape of insistence upon legitimacy and monogamy. Present-day civilization makes it plain that it will only permit sexual relationships on the basis of a solitary, indissoluble bond between one man and one woman, and that it does not like sexuality as a source of pleasure in its own right and is only prepared to tolerate it because there is so far no substitute for it as a means of propagating the human race.

This, of course, is an extreme picture. Everybody knows that it has proved impossible to put it into execution, even for quite short periods. Only the weaklings have submitted to such an extensive encroachment upon their sexual freedom, and stronger natures have only done so subject to a compensatory condition, which will be mentioned later. Civilized society has found itself obliged to pass over in silence many transgressions which, according to its own prescripts, it ought to have punished. But we must not err on the other side and assume that, because it does not achieve all its aims, such an attitude on the part of society is entirely innocuous. The sexual life of civilized man is notwithstanding severely impaired; it sometimes gives the impression of being in process of involution as a function, just as our teeth and hair seem to be as organs. One is probably justified in assuming that its importance as a source of feelings of happiness, and therefore in the fulfilment of our aim in life, has sensibly diminished.¹ Sometimes one seems to perceive that it is not only the pressure of civilization but something in the nature of the function itself which denies us full satisfaction and urges us along other paths. This may be wrong; it is hard to decide.²

¹ Among the works of that sensitive English writer, John Galsworthy, who enjoys general recognition to-day, there is a short story of which I early formed a high opinion. It is called 'The Apple-Tree', and it brings home to us how the life of present-day civilized people leaves no room for the simple natural love of two human beings.

² The view expressed above is supported by the following considerations. Man is an animal organism with (like others) an unmistakably bisexual disposition. The individual corresponds to a fusion of two symmetrical halves, of which, according to some investigators, one is purely male and the other female. It is equally possible that each half was originally hermaphrodite. Sex is a biological fact which, although it is of extraordinary importance in mental life, is hard to grasp psychologically. We are accustomed to say that every human being displays both male and female instinctual impulses, needs and attributes; but though anatomy, it is true, can point out the characteristic of maleness and femaleness, psychology cannot. For psychology the contrast between the sexes fades away into one between activity and passivity, in which we far too readily identify activity with maleness and passivity with femaleness, a view which is by no means universally confirmed in the animal kingdom. The theory of bisexuality is still surrounded by many obscurities and we cannot but feel it as a serious impediment in psycho-analysis that it has not yet found any link with the theory of the instincts. However this may be, if we assume it as a fact that each individual seeks to satisfy both male and female wishes in his sexual life, we are prepared for the possibility that those demands are not fulfilled by the same object, and that they interfere with each other unless they can be kept apart and each impulse guided into a particular channel that is suited to it. Another difficulty arises from the circumstance that there is so often associated with the erotic relationship, over and above its own sadistic components, a quota of plain inclination to aggression. The love-object will not always view these complications with the degree of understanding and tolerance shown by the peasant woman who complained that her husband did not love her any more, since he had not beaten her for a week.

The conjecture which goes deepest, however, is the one which takes its start from what I have said above (p. 4495) in my footnote. It is to the effect that, with the assumption of an erect posture by man and with the depreciation of his sense of smell, it was not only his anal erotism which threatened to fall a victim to organic repression, but the whole of his sexuality; so that since this, the sexual function has been accompanied by a repugnance which cannot further be accounted for, and which prevents its complete satisfaction and forces it away from the sexual aim into sublimations and libidinal displacements. I know that Bleuler (1913) once pointed to the existence of a primary repelling attitude like this towards sexual life. All neurotics, and many others besides, take exception to the fact that '*inter urinas et faeces nascimur*'. The genitals, too, give rise to strong sensations of smell which many people cannot tolerate and which spoil sexual intercourse for them. Thus we should find that the deepest root of the sexual repression which advances along with civilization is the organic defence of the new form of life achieved with man's erect gait against his earlier animal existence. This result of scientific research coincides in a remarkable way with commonplace prejudices that have often made themselves heard. Nevertheless, these things are at present no more than unconfirmed possibilities which have not been substantiated by science. Nor should we forget that, in spite of the undeniable depreciation of olfactory stimuli, there exist even in Europe people among whom the strong genital odours which are so repellent to us are highly prized as sexual stimulants and who refuse to give them up. (Cf. the collections of folklore obtained from Iwan Bloch's questionnaire on the sense of smell in sexual life published in different volumes of Friedrich S. Krauss's *Anthropophyteia*.)

V

Psycho-analytic work has shown us that it is precisely these frustrations of sexual life which people known as neurotics cannot tolerate. The neurotic creates substitutive satisfactions for himself in his symptoms, and these either cause him suffering in themselves or become sources of suffering for him by raising difficulties in his relations with his environment and the society he belongs to. The latter fact is easy to understand; the former presents us with a new problem. But civilization demands other sacrifices besides that of sexual satisfaction.

We have treated the difficulty of cultural development as a general difficulty of development by tracing it to the inertia of the libido, to its disinclination to give up an old position for a new one. We are saying much the same thing when we derive the antithesis between civilization and sexuality from the circumstance that sexual love is a relationship between two individuals in which a third can only be superfluous or disturbing, whereas civilization depends on relationships between a considerable number of individuals. When a love-relationship is at its height there is no room left for any interest in the environment; a pair of lovers are sufficient to themselves, and do not even need the child they have in common to make them happy. In no other case does Eros so clearly betray the core of his being, his purpose of making one out of more than one; but when he has achieved this in the proverbial way through the love of two human beings, he refuses to go further.

So far, we can quite well imagine a cultural community consisting of double individuals like this, who, libidinally satisfied in themselves, are connected with one another through the bonds of common work and common interests. If this were so, civilization would not have to withdraw any energy from sexuality. But this desirable state of things does not, and never did, exist. Reality shows us that civilization is not content with the ties we have so far allowed it. It aims at binding the members of the community together in a libidinal way as well and employs every means to that end. It favours every path by which strong identifications can be established between the members of the community, and it summons up aim-inhibited libido on the largest scale so as to strengthen the communal bond by relations of friendship. In order for these aims to be fulfilled, a restriction upon sexual life is unavoidable. But we are unable to understand what the necessity is which forces civilization along this path and which causes its antagonism to sexuality. There must be some disturbing factor which we have not yet discovered.

The clue may be supplied by one of the ideal demands, as we have called them, of civilized society. It runs: 'Thou shalt love thy neighbour as thyself.' It is known throughout the world and is undoubtedly older than Christianity, which puts it forward as its proudest claim. Yet it is certainly not very old; even in historical times it was still strange to mankind. Let us adopt a naïve attitude towards it, as though we were hearing it for the first time; we shall be unable then to suppress a feeling of surprise and bewilderment. Why should we do it? What good will it do us? But, above all, how shall we achieve it? How can it be possible? My love is something valuable to me which I ought not to throw away without reflection. It imposes duties on me for whose fulfilment I must be ready to make sacrifices. If I love someone, he must deserve it in some way. (I leave out of account the use he may be to me, and also his possible significance for me as a sexual object, for neither of these two kinds of relationship comes into question where the precept to love my neighbour is concerned.) He deserves it if he is so like me in important ways that I can love myself in him; and he deserves it if he is so much more perfect than myself that I can love my ideal of my own self in him. Again, I have to love him if he is my friend's son, since the pain my friend would feel if any harm came to him would be my pain too - I should have to share it. But if he is a stranger to me and if he cannot attract me by any worth of his own or any significance that he may already have acquired for my emotional life, it will be hard for me to love him. Indeed, I should be wrong to do so, for my love is valued by all my own people as a sign of my preferring them, and it is an injustice to them if I put a stranger on a par with them. But if I am to love him (with this universal love) merely because he, too, is an inhabitant of this earth, like an insect, an earth-worm or a grass-snake, then I fear that only a small modicum of my love will fall to his share - not by any possibility as much as, by the judgement of my reason, I am entitled to retain for myself. What is the point of a precept enunciated with so much solemnity if its fulfilment cannot be recommended as reasonable?

On closer inspection, I find still further difficulties. Not merely is this stranger in general unworthy of my love; I must honestly confess that he has more claim to my hostility and even my hatred. He seems not to have the least trace of love for me and shows me not the slightest consideration. If it will do him any good he has no hesitation in injuring me, nor does he ask himself whether the amount of advantage he gains bears any proportion to the extent of the harm he does to me. Indeed, he need not even obtain an advantage; if he can satisfy any sort of desire by it, he thinks nothing of jeering at me, insulting me, slandering me and showing his superior power; and the more secure he feels and the more helpless I am, the more certainly I can expect him to behave like this to me. If he behaves differently, if he shows me consideration and forbearance as a stranger, I am ready to treat him in the same way, in any case and quite apart from any precept. Indeed, if this grandiose commandment had run 'Love thy neighbour as thy neighbour loves thee', I should not take exception to it. And there is a second commandment, which seems to me even more incomprehensible and arouses still stronger opposition in me. It is 'Love thine enemies'. If I think it over, however, I see that I am wrong in treating it as a greater imposition. At bottom it is the same thing.¹

¹ A great imaginative writer may permit himself to give expression - jokingly, at all events - to psychological truths that are severely proscribed. Thus Heine confesses: 'Mine is a most peaceable disposition. My wishes are: a humble cottage with a thatched roof, but a good bed, good food, the freshest milk and butter, flowers before my window, and a few fine trees before my door; and if God wants to make my happiness complete, he will grant me the joy of seeing some six or seven of my enemies hanging from those trees. Before their death I shall, moved in my heart, forgive them all the wrong they did me in their lifetime. One must, it is true, forgive one's enemies - but not before they have been hanged.' (*Gedanken und Einfälle*.)

I think I can now hear a dignified voice admonishing me: 'It is precisely because your neighbour is not worthy of love, and is on the contrary your enemy, that you should love him as yourself.' I then understand that the case is one like that of *Credo quia absurdum*.

Now it is very probable that my neighbour, when he is enjoined to love me as himself, will answer exactly as I have done and will repel me for the same reasons. I hope he will not have the same objective grounds for doing so, but he will have the same idea as I have. Even so, the behaviour of human beings shows differences, which ethics, disregarding the fact that such differences are determined, classifies as 'good' or 'bad'. So long as these undeniable differences have not been removed, obedience to high ethical demands entails damage to the aims of civilization, for it puts a positive premium on being bad. One is irresistibly reminded of an incident in the French Chamber when capital punishment was being debated. A member had been passionately supporting its abolition and his speech was being received with tumultuous applause, when a voice from the hall called out: 'Que messieurs les assassins commencent!'

The element of truth behind all this, which people are so ready to disavow, is that men are not gentle creatures who want to be loved, and who at the most can defend themselves if they are attacked; they are, on the contrary, creatures among whose instinctual endowments is to be reckoned a powerful share of aggressiveness. As a result, their neighbour is for them not only a potential helper or sexual object, but also someone who tempts them to satisfy their aggressiveness on him, to exploit his capacity for work without compensation, to use him sexually without his consent, to seize his possessions, to humiliate him, to cause him pain, to torture and to kill him. *Homo homini lupus*. Who, in the face of all his experience of life and of history, will have the courage to dispute this assertion? As a rule this cruel aggressiveness waits for some provocation or puts itself at the service of some other purpose, whose goal might also have been reached by milder measures. In circumstances that are favourable to it, when the mental counter-forces which ordinarily inhibit it are out of action, it also manifests itself spontaneously and reveals man as a savage beast to whom consideration towards his own kind is something alien. Anyone who calls to mind the atrocities committed during the racial migrations or the invasions of the Huns, or by the people known as Mongols under Jenghiz Khan and Tamerlane, or at the capture of Jerusalem by the pious Crusaders, or even, indeed, the horrors of the recent World War - anyone who calls these things to mind will have to bow humbly before the truth of this view.

The existence of this inclination to aggression, which we can detect in ourselves and justly assume to be present in others, is the factor which disturbs our relations with our neighbour and which forces civilization into such a high expenditure. In consequence of this primary mutual hostility of human beings, civilized society is perpetually threatened with disintegration. The interest of work in common would not hold it together; instinctual passions are stronger than reasonable interests. Civilization has to use its utmost efforts in order to set limits to man's aggressive instincts and to hold the manifestations of them in check by psychical reaction-formations. Hence, therefore, the use of methods intended to incite people into identifications and aim-inhibited relationships of love, hence the restriction upon sexual life, and hence too the ideal's commandment to love one's neighbour as oneself - a commandment which is really justified by the fact that nothing else runs so strongly counter to the original nature of man. In spite of every effort, these endeavours of civilization have not so far achieved very much. It hopes to prevent the crudest excesses of brutal violence by itself assuming the right to use violence against criminals, but the law is not able to lay hold of the more cautious and refined manifestations of human aggressiveness. The time comes when each one of us has to give up as illusions the expectations which, in his youth, he pinned upon his fellow men, and when he may learn how much difficulty and pain has been added to his life by their ill-will. At the same time, it would be unfair to reproach civilization with trying to eliminate strife and competition from human activity. These things are undoubtedly indispensable. But opposition is not necessarily enmity; it is merely misused and made an *occasion* for enmity.

The communists believe that they have found the path to deliverance from our evils. According to them, man is wholly good and is well-disposed to his neighbour; but the institution of private property has corrupted his nature. The ownership of private wealth gives the individual power, and with it the temptation to ill-treat his neighbour; while the man who is excluded from possession is bound to rebel in hostility against his oppressor. If private property were abolished, all wealth held in common, and everyone allowed to share in the enjoyment of it, ill-will and hostility would disappear among men. Since everyone's needs would be satisfied, no one would have any reason to regard another as his enemy; all would willingly undertake the work that was necessary. I have no concern with any economic criticisms of the communist system; I cannot enquire into whether the abolition of private property is expedient or advantageous.¹ But I am able to recognize that the psychological premisses on which the system is based are an untenable illusion. In abolishing private property we deprive the human love of aggression of one of its instruments, certainly a strong one, though certainly not the strongest; but we have in no way altered the differences in power and influence which are misused by aggressiveness, nor have we altered anything in its nature. Aggressiveness was not created by property. It reigned almost without limit in primitive times, when property was still very scanty, and it already shows itself in the nursery almost before property has given up its primal, anal form; it forms the basis of every relation of affection and love among people (with the single exception, perhaps, of the mother's relation to her male child). If we do away with personal rights over material wealth, there still remains prerogative in the field of sexual relationships, which is bound to become the source of the strongest dislike and the most violent hostility among men who in other respects are on an equal footing. If we were to remove this factor, too, by allowing complete freedom of sexual life and thus abolishing the family, the germ-cell of civilization, we cannot, it is true, easily foresee what new paths the development of civilization could take; but one thing we can expect, and that is that this indestructible feature of human nature will follow it there.

¹ Anyone who has tasted the miseries of poverty in his own youth and has experienced the indifference and arrogance of the well-to-do, should be safe from the suspicion of having no understanding or good will towards endeavours to fight against the inequality of wealth among men and all that it leads to. To be sure, if an attempt is made to base this fight upon an abstract demand, in the name of justice, for equality for all men, there is a very obvious objection to be made - that nature, by endowing individuals with extremely unequal physical attributes and mental capacities, has introduced injustices against which there is no remedy.

It is clearly not easy for men to give up the satisfaction of this inclination to aggression. They do not feel comfortable without it. The advantage which a comparatively small cultural group offers of allowing this instinct an outlet in the form of hostility against intruders is not to be despised. It is always possible to bind together a considerable number of people in love, so long as there are other people left over to receive the manifestations of their aggressiveness. I once discussed the phenomenon that it is precisely communities with adjoining territories, and related to each other in other ways as well, who are engaged in constant feuds and in ridiculing each other - like the Spaniards and Portuguese, for instance, the North Germans and South Germans, the English and Scotch, and so on. I gave this phenomenon the name of 'the narcissism of minor differences', a name which does not do much to explain it. We can now see that it is a convenient and relatively harmless satisfaction of the inclination to aggression, by means of which cohesion between the members of the community is made easier. In this respect the Jewish people, scattered everywhere, have rendered most useful services to the civilizations of the countries that have been their hosts; but unfortunately all the massacres of the Jews in the Middle Ages did not suffice to make that period more peaceful and secure for their Christian fellows. When once the Apostle Paul had posited universal love between men as the foundation of his Christian community, extreme intolerance on the part of Christendom towards those who remained outside it became the inevitable consequence. To the Romans, who had not founded their communal life as a State upon love, religious intolerance was something foreign, although with them religion was a concern of the State and the State was permeated by religion. Neither was it an unaccountable chance that the dream of a Germanic world-dominion called for anti-Semitism as its complement; and it is intelligible that the attempt to establish a new, communist civilization in Russia should find its psychological support in the persecution of the bourgeois. One only wonders, with concern, what the Soviets will do after they have wiped out their bourgeois.

If civilization imposes such great sacrifices not only on man's sexuality but on his aggressivity, we can understand better why it is hard for him to be happy in that civilization. In fact, primitive man was better off in knowing no restrictions of instinct. To counterbalance this, his prospects of enjoying this happiness for any length of time were very slender. Civilized man has exchanged a portion of his possibilities of happiness for a portion of security. We must not forget, however, that in the primal family only the head of it enjoyed this instinctual freedom; the rest lived in slavish suppression. In that primal period of civilization, the contrast between a minority who enjoyed the advantages of civilization and a majority who were robbed of those advantages was, therefore, carried to extremes. As regards the primitive peoples who exist to-day, careful researches have shown that their instinctual life is by no means to be envied for its freedom. It is subject to restrictions of a different kind but perhaps of greater severity than those attaching to modern civilized man.

When we justly find fault with the present state of our civilization for so inadequately fulfilling our demands for a plan of life that shall make us happy, and for allowing the existence of so much suffering which could probably be avoided - when, with unsparing criticism, we try to uncover the roots of its imperfection, we are undoubtedly exercising a proper right and are not showing ourselves enemies of civilization. We may expect gradually to carry through such alterations in our civilization as will better satisfy our needs and will escape our criticisms. But perhaps we may also familiarize ourselves with the idea that there are difficulties attaching to the nature of civilization which will not yield to any attempt at reform. Over and above the tasks of restricting the instincts, which we are prepared for, there forces itself on our notice the danger of a state of things which might be termed 'the psychological poverty of groups'. This danger is most threatening where the bonds of a society are chiefly constituted by the identification of its members with one another, while individuals of the leader type do not acquire the importance that should fall to them in the formation of a group.¹ The present cultural state of America would give us a good opportunity for studying the damage to civilization which is thus to be feared. But I shall avoid the temptation of entering upon a critique of American civilization; I do not wish to give an impression of wanting myself to employ American methods.

¹ See *Group Psychology and the Analysis of the Ego* (1921c).

VI

In none of my previous writings have I had so strong a feeling as now that what I am describing is common knowledge and that I am using up paper and ink and, in due course, the compositor's and printer's work and material in order to expound things which are, in fact, self-evident. For that reason I should be glad to seize the point if it were to appear that the recognition of a special, independent aggressive instinct means an alteration of the psycho-analytic theory of the instincts.

We shall see, however, that this is not so and that it is merely a matter of bringing into sharper focus a turn of thought arrived at long ago and of following out its consequences. Of all the slowly developed parts of analytic theory, the theory of the instincts is the one that has felt its way the most painfully forward. And yet that theory was so indispensable to the whole structure that something had to be put in its place. In what was at first my utter perplexity, I took as my starting-point a saying of the poet-philosopher, Schiller, that 'hunger and love are what moves the world'. Hunger could be taken to represent the instincts which aim at preserving the individual; while love strives after objects, and its chief function, favoured in every way by nature, is the preservation of the species. Thus, to begin with, ego-instincts and object-instincts confronted each other. It was to denote the energy of the latter and only the latter instinct that I introduced the term 'libido'. Thus the antithesis was between the ego-instincts and the 'libidinal' instincts of love (in its widest sense) which were directed to an object. One of these object-instincts, the sadistic instinct, stood out from the rest, it is true, in that its aim was so very far from being loving. Moreover it was obviously in some respects attached to the ego-instincts: it could not hide its close affinity with instincts of mastery which have no libidinal purpose. But these discrepancies were got over; after all, sadism was clearly a part of sexual life, in the activities of which affection could be replaced by cruelty. Neurosis was regarded as the outcome of a struggle between the interest of self-preservation and the demands of the libido, a struggle in which the ego had been victorious but at the price of severe sufferings and renunciations.

Every analyst will admit that even to-day this view has not the sound of a long-discarded error. Nevertheless, alterations in it became essential, as our enquiries advanced from the repressed to the repressing forces, from the object-instincts to the ego. The decisive step forward was the introduction of the concept of narcissism - that is to say, the discovery that the ego itself is cathected with libido, that the ego, indeed, is the libido's original home, and remains to some extent its headquarters. This narcissistic libido turns towards objects, and thus becomes object-libido; and it can change back into narcissistic libido once more. The concept of narcissism made it possible to obtain an analytic understanding of the traumatic neuroses and of many of the affections bordering on the psychoses, as well as of the latter themselves. It was not necessary to give up our interpretation of the transference neuroses as attempts made by the ego to defend itself against sexuality; but the concept of libido was endangered. Since the ego-instincts, too, were libidinal, it seemed for a time inevitable that we should make libido coincide with instinctual energy in general, as C. G. Jung had already advocated earlier. Nevertheless, there still remained in me a kind of conviction, for which I was not as yet able to find reasons, that the instincts could not all be of the same kind. My next step was taken in *Beyond the Pleasure Principle* (1920g), when the compulsion to repeat and the conservative character of instinctual life first attracted my attention. Starting from speculations on the beginning of life and from biological parallels, I drew the conclusion that, besides the instinct to preserve living substance and to join it into ever larger units,¹ there must exist another, contrary instinct seeking to dissolve those units and to bring them back to their primaeval, inorganic state. That is to say, as well as Eros there was an instinct of death. The phenomena of life could be explained from the concurrent or mutually opposing action of these two instincts. It was not easy, however, to demonstrate the activities of this supposed death instinct. The manifestations of Eros were conspicuous and noisy enough. It might be assumed that the death instinct operated silently within the organism towards its dissolution, but that, of course, was no proof. A more fruitful idea was that a portion of the instinct is diverted towards the external world and comes to light as an instinct of aggressiveness and destructiveness. In this way the instinct itself could be pressed into the service of Eros, in that the organism was destroying some other thing, whether animate or inanimate, instead of destroying its own self. Conversely, any restriction of this aggressiveness directed outwards would be bound to increase the self-destruction, which is in any case proceeding. At the same time one can suspect from this example that the two kinds of instinct seldom - perhaps never - appear in isolation from each other, but are alloyed with each other in varying and very different proportions and so become unrecognizable to our judgement. In sadism, long since known to us as a component instinct of sexuality, we should have before us a particularly strong alloy of this kind between trends of love and the destructive instinct; while its counterpart, masochism, would be a union between destructiveness directed inwards and sexuality - a union which makes what is otherwise an imperceptible trend into a conspicuous and tangible one.

¹ The opposition which thus emerges between the ceaseless trend by Eros towards extension and the general conservative nature of the instincts is striking, and it may become the starting-point for the study of further problems.

The assumption of the existence of an instinct of death or destruction has met with resistance even in analytic circles; I am aware that there is a frequent inclination rather to ascribe whatever is dangerous and hostile in love to an original bipolarity in its own nature. To begin with it was only tentatively that I put forward the views I have developed here, but in the course of time they have gained such a hold upon me that I can no longer think in any other way. To my mind, they are far more serviceable from a theoretical standpoint than any other possible ones; they provide that simplification, without either ignoring or doing violence to the facts, for which we strive in scientific work. I know that in sadism and masochism we have always seen before us manifestations of the destructive instinct (directed outwards and inwards), strongly alloyed with erotism; but I can no longer understand how we can have overlooked the ubiquity of non-erotic aggressivity and destructiveness and can have failed to give it its due place in our interpretation of life. (The desire for destruction when it is directed *inwards* mostly eludes our perception, of course, unless it is tinged with erotism.) I remember my own defensive attitude when the idea of an instinct of destruction first emerged in psycho-analytic literature, and how long it took before I became receptive to it. That others should have shown, and still show, the same attitude of rejection surprises me less. For 'little children do not like it' when there is talk of the inborn human inclination to 'badness', to aggressiveness and destructiveness, and so to cruelty as well. God has made them in the image of His own perfection; nobody wants to be reminded how hard it is to reconcile the undeniable existence of evil - despite the protestations of Christian Science - with His all-powerfulness or His all-goodness. The Devil would be the best way out as an excuse for God; in that way he would be playing the same part as an agent of economic discharge as the Jew does in the world of the Aryan ideal. But even so, one can hold God responsible for the existence of the Devil just as well as for the existence of the wickedness which the Devil embodies. In view of these difficulties, each of us will be well advised, on some suitable occasion, to make a low bow to the deeply moral nature of mankind; it will help us to be generally popular and much will be forgiven us for it.¹

¹ In Goethe's Mephistopheles we have a quite exceptionally convincing identification of the principle of evil with the destructive instinct:

Denn alles, was entsteht,
Ist wert, dass es zu Grunde geht . . .
So ist dann alles, was Ihr Sünde,
Zerstörung, kurz das Böse nennt,
Mein eigentliches Element.

The Devil himself names as his adversary, not what is holy and good, but Nature's power to create, to multiply life - that is, Eros:

Der Luft, dem Wasser, wie der Erden
Entwinden tausend Keime sich,
Im Trocknen, Feuchten, Warmen, Kalten!
Hätt' ich mir nicht die Flamme vorbehalten,
Ich hätte nichts Aparts für mich.

The name 'libido' can once more be used to denote the manifestations of the power of Eros in order to distinguish them from the energy of the death instinct.¹ It must be confessed that we have much greater difficulty in grasping that instinct; we can only suspect it, as it were, as something in the background behind Eros, and it escapes detection unless its presence is betrayed by its being alloyed with Eros. It is in sadism, where the death instinct twists the erotic aim in its own sense and yet at the same time fully satisfies the erotic urge, that we succeed in obtaining the clearest insight into its nature and its relation to Eros. But even where it emerges without any sexual purpose, in the blindest fury of destructiveness, we cannot fail to recognize that the satisfaction of the instinct is accompanied by an extraordinarily high degree of narcissistic enjoyment, owing to its presenting the ego with a fulfilment of the latter's old wishes for omnipotence. The instinct of destruction, moderated and tamed, and, as it were, inhibited in its aim, must, when it is directed towards objects, provide the ego with the satisfaction of its vital needs and with control over nature. Since the assumption of the existence of the instinct is mainly based on theoretical grounds, we must also admit that it is not entirely proof against theoretical objections. But this is how things appear to us now, in the present state of our knowledge; future research and reflection will no doubt bring further light which will decide the matter.

¹ Our present point of view can be roughly expressed in the statement that libido has a share in every instinctual manifestation, but that not everything in that manifestation is libido.

In all that follows I adopt the standpoint, therefore, that the inclination to aggression is an original, self-subsisting instinctual disposition in man, and I return to my view that it constitutes the greatest impediment to civilization. At one point in the course of this enquiry I was led to the idea that civilization was a special process which mankind undergoes, and I am still under the influence of that idea. I may now add that civilization is a process in the service of Eros, whose purpose is to combine single human individuals, and after that families, then races, peoples and nations, into one great unity, the unity of mankind. Why this has to happen, we do not know; the work of Eros is precisely this. ¹ These collections of men are to be libidinally bound to one another. Necessity alone, the advantages of work in common, will not hold them together. But man's natural aggressive instinct, the hostility of each against all and of all against each, opposes this programme of civilization. This aggressive instinct is the derivative and the main representative of the death instinct which we have found alongside of Eros and which shares world-dominion with it. And now, I think, the meaning of the evolution of civilization is no longer obscure to us. It must present the struggle between Eros and Death, between the instinct of life and the instinct of destruction, as it works itself out in the human species. This struggle is what all life essentially consists of, and the evolution of civilization may therefore be simply described as the struggle for life of the human species.¹ And it is this battle of the giants that our nurse-maids try to appease with their lullaby about Heaven.

¹ And we may probably add more precisely, a struggle for life in the shape it was bound to assume after a certain event which still remains to be discovered.

VII

Why do our relatives, the animals, not exhibit any such cultural struggle? We do not know. Very probably some of them - the bees, the ants, the termites - strove for thousands of years before they arrived at the State institutions, the distribution of functions and the restrictions on the individual, for which we admire them to-day. It is a mark of our present condition that we know from our own feelings that we should not think ourselves happy in any of these animal States or in any of the roles assigned in them to the individual. In the case of other animal species it may be that a temporary balance has been reached between the influences of their environment and the mutually contending instincts within them, and that thus a cessation of development has come about. It may be that in primitive man a fresh access of libido kindled a renewed burst of activity on the part of the destructive instinct. There are a great many questions here to which as yet there is no answer.

Another question concerns us more nearly. What means does civilization employ in order to inhibit the aggressiveness which opposes it, to make it harmless, to get rid of it, perhaps? We have already become acquainted with a few of these methods, but not yet with the one that appears to be the most important. This we can study in the history of the development of the individual. What happens in him to render his desire for aggression innocuous? Something very remarkable, which we should never have guessed and which is nevertheless quite obvious. His aggressiveness is introjected, internalized; it is, in point of fact, sent back to where it came from - that is, it is directed towards his own ego. There it is taken over by a portion of the ego, which sets itself over against the rest of the ego as super-ego, and which now, in the form of 'conscience', is ready to put into action against the ego the same harsh aggressiveness that the ego would have liked to satisfy upon other, extraneous individuals. The tension between the harsh super-ego and the ego that is subjected to it, is called by us the sense of guilt; it expresses itself as a need for punishment. Civilization, therefore, obtains mastery over the individual's dangerous desire for aggression by weakening and disarming it and by setting up an agency within him to watch over it, like a garrison in a conquered city.

As to the origin of the sense of guilt, the analyst has different views from other psychologists; but even he does not find it easy to give an account of it. To begin with, if we ask how a person comes to have a sense of guilt, we arrive at an answer which cannot be disputed: a person feels guilty (devout people would say 'sinful') when he has done something which he knows to be 'bad'. But then we notice how little this answer tells us. Perhaps, after some hesitation, we shall add that even when a person has not actually *done* the bad thing but has only recognized in himself an *intention* to do it, he may regard himself as guilty; and the question then arises of why the intention is regarded as equal to the deed. Both cases, however, presuppose that one had already recognized that what is bad is reprehensible, is something that must not be carried out. How is this judgement arrived at? We may reject the existence of an original, as it were natural, capacity to distinguish good from bad. What is bad is often not at all what is injurious or dangerous to the ego; on the contrary, it may be something which is desirable and enjoyable to the ego. Here, therefore, there is an extraneous influence at work, and it is this that decides what is to be called good or bad. Since a person's own feelings would not have led him along this path, he must have had a motive for submitting to this extraneous influence. Such a motive is easily discovered in his helplessness and his dependence on other people, and it can best be designated as fear of loss of love. If he loses the love of another person upon whom he is dependent, he also ceases to be protected from a variety of dangers. Above all, he is exposed to the danger that this stronger person will show his superiority in the form of punishment. At the beginning, therefore, what is bad is whatever causes one to be threatened with loss of love. For fear of that loss, one must avoid it. This, too, is the reason why it makes little difference whether one has already done the bad thing or only intends to do it. In either case the danger only sets in if and when the authority discovers it, and in either case the authority would behave in the same way.

This state of mind is called a 'bad conscience'; but actually it does not deserve this name, for at this stage the sense of guilt is clearly only a fear of loss of love, 'social' anxiety. In small children it can never be anything else, but in many adults, too, it has only changed to the extent that the place of the father or the two parents is taken by the larger human community. Consequently, such people habitually allow themselves to do any bad thing which promises them enjoyment, so long as they are sure that the authority will not know anything about it or cannot blame them for it; they are afraid only of being found out.¹ Present-day society has to reckon in general with this state of mind.

A great change takes place only when the authority is internalized through the establishment of a super-ego. The phenomena of conscience then reach a higher stage. Actually, it is not until now that we should speak of conscience or a sense of guilt.² At this point, too, the fear of being found out comes to an end; the distinction, moreover, between doing something bad and wishing to do it disappears entirely, since nothing can be hidden from the super-ego, not even thoughts. It is true that the seriousness of the situation from a real point of view has passed away, for the new authority, the super-ego, has no motive that we know of for ill-treating the ego, with which it is intimately bound up; but genetic influence, which leads to the survival of what is past and has been surmounted, makes itself felt in the fact that fundamentally things remain as they were at the beginning. The super-ego torments the sinful ego with the same feeling of anxiety and is on the watch for opportunities of getting it punished by the external world.

¹ This reminds one of Rousseau's famous mandarin.

² Everyone of discernment will understand and take into account the fact that in this summary description we have sharply delimited events which in reality occur by gradual transitions, and that it is not merely a question of the *existence* of a super-ego but of its relative strength and sphere of influence. All that has been said above about conscience and guilt is, moreover, common knowledge and almost undisputed.

At this second stage of development, the conscience exhibits a peculiarity which was absent from the first stage and which is no longer easy to account for. For the more virtuous a man is, the more severe and distrustful is its behaviour, so that ultimately it is precisely those people who have carried saintliness furthest who reproach themselves with the worst sinfulness. This means that virtue forfeits some part of its promised reward; the docile and contented ego does not enjoy the trust of its mentor, and strives in vain, it would seem, to acquire it. The objection will at once be made that these difficulties are artificial ones, and it will be said that a stricter and more vigilant conscience is precisely the hallmark of a moral man. Moreover, when saints call themselves sinners, they are not so wrong, considering the temptations to instinctual satisfaction to which they are exposed in a specially high degree - since, as is well known, temptations are merely increased by constant frustration, whereas an occasional satisfaction of them causes them to diminish, at least for the time being. The field of ethics, which is so full of problems, presents us with another fact: namely that ill-luck - that is, external frustration - so greatly enhances the power of the conscience in the super-ego. As long as things go well with a man, his conscience is lenient and lets the ego do all sorts of things; but when misfortune befalls him, he searches his soul, acknowledges his sinfulness, heightens the demands of his conscience, imposes abstinences on himself and punishes himself with penances.¹ Whole peoples have behaved in this way, and still do. This, however, is easily explained by the original infantile stage of conscience, which, as we see, is not given up after the introjection into the super-ego, but persists alongside of it and behind it. Fate is regarded as a substitute for the parental agency. If a man is unfortunate it means that he is no longer loved by this highest power; and, threatened by such a loss of love, he once more bows to the parental representative in his super-ego - a representative whom, in his days of good fortune, he was ready to neglect. This becomes especially clear where Fate is looked upon in the strictly religious sense of being nothing else than an expression of the Divine Will. The people of Israel had believed themselves to be the favourite child of God, and when the great Father caused misfortune after misfortune to rain down upon this people of his, they were never shaken in their belief in his relationship to them or questioned his power or righteousness. Instead, they produced the prophets, who held up their sinfulness before them; and out of their sense of guilt they created the over-strict commandments of their priestly religion. It is remarkable how differently a primitive man behaves. If he has met with a misfortune, he does not throw the blame on himself but on his fetish, which has obviously not done its duty, and he gives it a thrashing instead of punishing himself.

¹ This enhancing of morality as a consequence of ill-luck has been illustrated by Mark Twain in a delightful little story, *The First Melon I ever Stole*. This first melon happened to be unripe. I heard Mark Twain tell the story himself in one of his public readings. After he had given out the title, he stopped and asked himself as though he was in doubt: 'Was it the first?' With this, everything had been said. The first melon was evidently not the only one.

Thus we know of two origins of the sense of guilt: one arising from fear of an authority, and the other, later on, arising from fear of the super-ego. The first insists upon a renunciation of instinctual satisfactions; the second, as well as doing this, presses for punishment, since the continuance of the forbidden wishes cannot be concealed from the super-ego. We have also learned how the severity of the super-ego - the demands of conscience - is to be understood. It is simply a continuation of the severity of the external authority, to which it has succeeded and which it has in part replaced. We now see in what relationship the renunciation of instinct stands to the sense of guilt. Originally, renunciation of instinct was the result of fear of an external authority: one renounced one's satisfactions in order not to lose its love. If one has carried out this renunciation, one is, as it were, quits with the authority and no sense of guilt should remain. But with fear of the super-ego the case is different. Here, instinctual renunciation is not enough, for the wish persists and cannot be concealed from the super-ego. Thus, in spite of the renunciation that has been made, a sense of guilt comes about. This constitutes a great economic disadvantage in the erection of a super-ego, or, as we may put it, in the formation of a conscience. Instinctual renunciation now no longer has a completely liberating effect; virtuous continence is no longer rewarded with the assurance of love. A threatened external unhappiness - loss of love and punishment on the part of the external authority - has been exchanged for a permanent internal unhappiness, for the tension of the sense of guilt.

These interrelations are so complicated and at the same time so important that, at the risk of repeating myself, I shall approach them from yet another angle. The chronological sequence, then, would be as follows. First comes renunciation of instinct owing to fear of aggression by the *external* authority. (This is, of course, what fear of the loss of love amounts to, for love is a protection against this punitive aggression.) After that comes the erection of an *internal* authority, and renunciation of instinct owing to fear of it - owing to fear of conscience. In this second situation bad intentions are equated with bad actions, and hence come a sense of guilt and a need for punishment. The aggressiveness of conscience keeps up the aggressiveness of the authority. So far things have no doubt been made clear; but where does this leave room for the reinforcing influence of misfortune (of renunciation imposed from without), and for the extraordinary severity of conscience in the best and most tractable people? We have already explained both these peculiarities of conscience, but we probably still have an impression that those explanations do not go to the bottom of the matter, and leave a residue still unexplained. And here at last an idea comes in which belongs entirely to psycho-analysis and which is foreign to people's ordinary way of thinking. This idea is of a sort which enables us to understand why the subject-matter was bound to seem so confused and obscure to us. For it tells us that conscience (or more correctly, the anxiety which later becomes conscience) is indeed the cause of instinctual renunciation to begin with, but that later the relationship is reversed. Every renunciation of instinct now becomes a dynamic source of conscience and every fresh renunciation increases the latter's severity and intolerance. If we could only bring it better into harmony with what we already know about the history of the origin of conscience, we should be tempted to defend the paradoxical statement that conscience is the result of instinctual renunciation, or that instinctual renunciation (imposed on us from without) creates conscience, which then demands further instinctual renunciation.

The contradiction between this statement and what we have previously said about the genesis of conscience is in point of fact not so very great, and we see a way of further reducing it. In order to make our exposition easier, let us take as our example the aggressive instinct, and let us assume that the renunciation in question is always a renunciation of aggression. (This, of course, is only to be taken as a temporary assumption.) The effect of instinctual renunciation on the conscience then is that every piece of aggression whose satisfaction the subject gives up is taken over by the super-ego and increases the latter's aggressiveness (against the ego). This does not harmonize well with the view that the original aggressiveness of conscience is a continuance of the severity of the external authority and therefore has nothing to do with renunciation. But the discrepancy is removed if we postulate a different derivation for this first instalment of the super-ego's aggressivity. A considerable amount of aggressiveness must be developed in the child against the authority which prevents him from having his first, but none the less his most important, satisfactions, whatever the kind of instinctual deprivation that is demanded of him may be; but he is obliged to renounce the satisfaction of this revengeful aggressiveness. He finds his way out of this economically difficult situation with the help of familiar mechanisms. By means of identification he takes the unattackable authority into himself. The authority now turns into his super-ego and enters into possession of all the aggressiveness which a child would have liked to exercise against it. The child's ego has to content itself with the unhappy role of the authority - the father - who has been thus degraded. Here, as so often, the situation is reversed: 'If I were the father and you were the child, I should treat you badly.' The relationship between the super-ego and the ego is a return, distorted by a wish, of the real relationships between the ego, as yet undivided, and an external object. That is typical, too. But the essential difference is that the original severity of the super-ego does not - or does not so much - represent the severity which one has experienced from it, or which one attributes to it; it represents rather one's own aggressiveness towards it. If this is correct, we may assert truly that in the beginning conscience arises through the suppression of an aggressive impulse, and that it is subsequently reinforced by fresh suppressions of the same kind.

Which of these two views is correct? The earlier one, which genetically seemed so unassailable, or the newer one, which rounds off the theory in such a welcome fashion? Clearly, and by the evidence, too, of direct observations, both are justified. They do not contradict each other, and they even coincide at one point, for the child's revengeful aggressiveness will be in part determined by the amount of punitive aggression which he expects from his father. Experience shows, however, that the severity of the super-ego which a child develops in no way corresponds to the severity of treatment which he has himself met with.¹ The severity of the former seems to be independent of that of the latter. A child who has been very leniently brought up can acquire a very strict conscience. But it would also be wrong to exaggerate this independence; it is not difficult to convince oneself that severity of upbringing does also exert a strong influence on the formation of the child's super-ego. What it amounts to is that in the formation of the super-ego and the emergence of a conscience innate constitutional factors and influences from the real environment act in combination. This is not at all surprising; on the contrary, it is a universal aetiological condition for all such processes.²

¹ As has rightly been emphasized by Melanie Klein and by other English writers.

² The two main types of pathogenic methods of upbringing - over-strictness and spoiling - have been accurately assessed by Franz Alexander in his book *The Psychoanalysis of the Total Personality* (1927) in connection with Aichhorn's study of delinquency. The 'unduly lenient and indulgent father' is the cause of children's forming an over-severe super-ego, because, under the impression of the love that they receive, they have no other outlet for their aggressiveness but turning it inwards. In delinquent children, who have been brought up without love, the tension between ego and super-ego is lacking, and the whole of their aggressiveness can be directed outwards. Apart from a constitutional factor which may be supposed to be present, it can be said, therefore, that a severe conscience arises from the joint operation of two factors: the frustration of instinct, which unleashes aggressiveness, and the experience of being loved, which turns the aggressiveness inwards and hands it over to the super-ego.

It can also be asserted that when a child reacts to his first great instinctual frustrations with excessively strong aggressiveness and with a correspondingly severe super-ego, he is following a phylogenetic model and is going beyond the response that would be currently justified; for the father of prehistoric times was undoubtedly terrible, and an extreme amount of aggressiveness may be attributed to him. Thus, if one shifts over from individual to phylogenetic development, the differences between the two theories of the genesis of conscience are still further diminished. On the other hand, a new and important difference makes its appearance between these two developmental processes. We cannot get away from the assumption that man's sense of guilt springs from the Oedipus complex and was acquired at the killing of the father by the brothers banded together. On that occasion an act of aggression was not suppressed but carried out; but it was the same act of aggression whose suppression in the child is supposed to be the source of his sense of guilt. At this point I should not be surprised if the reader were to exclaim angrily: 'So it makes no difference whether one kills one's father or not - one gets a feeling of guilt in either case! We may take leave to raise a few doubts here. Either it is not true that the sense of guilt comes from suppressed aggressiveness, or else the whole story of the killing of the father is a fiction and the children of primaeval man did not kill their fathers any more often than children do nowadays. Besides, if it is not fiction but a plausible piece of history, it would be a case of something happening which everyone expects to happen - namely, of a person feeling guilty because he really has done something which cannot be justified. And of this event, which is after all an everyday occurrence, psycho-analysis has not yet given any explanation.'

That is true, and we must make good the omission. Nor is there any great secret about the matter. When one has a sense of guilt after having committed a misdeed, and because of it, the feeling should more properly be called *remorse*. It relates only to a deed that has been done, and, of course, it presupposes that a *conscience* - the readiness to feel guilty - was already in existence before the deed took place. Remorse of this sort can, therefore, never help us to discover the origin of conscience and of the sense of guilt in general. What happens in these everyday cases is usually this: an instinctual need acquires the strength to achieve satisfaction in spite of the conscience, which is, after all, limited in its strength; and with the natural weakening of the need owing to its having been satisfied, the former balance of power is restored. Psycho-analysis is thus justified in excluding from the present discussion the case of a sense of guilt due to remorse, however frequently such cases occur and however great their practical importance.

But if the human sense of guilt goes back to the killing of the primal father, that was after all a case of 'remorse'. Are we to assume that a conscience and a sense of guilt were not, as we have presupposed, in existence before the deed? If not, where, in this case, did the remorse come from? There is no doubt that this case should explain the secret of the sense of guilt to us and put an end to our difficulties. And I believe it does. This remorse was the result of the primordial ambivalence of feeling towards the father. His sons hated him, but they loved him, too. After their hatred had been satisfied by their act of aggression, their love came to the fore in their remorse for the deed. It set up the super-ego by identification with the father; it gave that agency the father's power, as though as a punishment for the deed of aggression they had carried out against him, and it created the restrictions which were intended to prevent a repetition of the deed. And since the inclination to aggressiveness against the father was repeated in the following generations, the sense of guilt, too, persisted, and it was reinforced once more by every piece of aggressiveness that was suppressed and carried over to the super-ego. Now, I think, we can at last grasp two things perfectly clearly: the part played by love in the origin of conscience and the fatal inevitability of the sense of guilt. Whether one has killed one's father or has abstained from doing so is not really the decisive thing. One is bound to feel guilty in either case, for the sense of guilt is an expression of the conflict due to ambivalence, of the eternal struggle between Eros and the instinct of destruction or death. This conflict is set going as soon as men are faced with the task of living together. So long as the community assumes no other form than that of the family, the conflict is bound to express itself in the Oedipus complex, to establish the conscience and to create the first sense of guilt. When an attempt is made to widen the community, the same conflict is continued in forms which are dependent on the past; and it is strengthened and results in a further intensification of the sense of guilt. Since civilization obeys an internal erotic impulsion which causes human beings to unite in a closely-knit group, it can only achieve this aim through an ever-increasing reinforcement of the sense of guilt. What began in relation to the father is completed in relation to the group. If civilization is a necessary course of development from the family to humanity as a whole, then - as a result of the inborn conflict arising from ambivalence, of the eternal struggle between the trends of love and death - there is inextricably bound up with it an increase of the sense of guilt, which will perhaps reach heights that the individual finds hard to tolerate. One is reminded of the great poet's moving arraignment of the 'Heavenly Powers':-

Ihr führt in's Leben uns hinein.
Ihr lasst den Armen schuldig werden,
Dann überlasst Ihr ihn den Pein,
Denn jede Schuld rächt sich auf Erden.¹

And we may well heave a sigh of relief at the thought that it is nevertheless vouchsafed to a few to salvage without effort from the whirlpool of their own feelings the deepest truths, towards which the rest of us have to find our way through tormenting uncertainty and with restless groping.

¹ One of the Harp-player's songs in Goethe's *Wilhelm Meister*.

VIII

Having reached the end of his journey, the author must ask his readers' forgiveness for not having been a more skilful guide and for not having spared them empty stretches of road and troublesome *détours*. There is no doubt that it could have been done better. I will attempt, late in the day, to make some amends.

In the first place, I suspect that the reader has the impression that our discussions on the sense of guilt disrupt the framework of this essay: that they take up too much space, so that the rest of its subject-matter, with which they are not always closely connected, is pushed to one side. This may have spoilt the structure of my paper; but it corresponds faithfully to my intention to represent the sense of guilt as the most important problem in the development of civilization and to show that the price we pay for our advance in civilization is a loss of happiness through the heightening of the sense of guilt.¹ Anything that still sounds strange about this statement, which is the final conclusion of our investigation, can probably be traced to the quite peculiar relationship - as yet completely unexplained - which the sense of guilt has to our consciousness. In the common case of remorse, which we regard as normal, this feeling makes itself clearly enough perceptible to consciousness. Indeed, we are accustomed to speak of a 'consciousness of guilt' instead of a 'sense of guilt'. Our study of the neuroses, to which, after all we owe the most valuable pointers to an understanding of normal conditions, brings us up against some contradictions. In one of those affections, obsessional neurosis, the sense of guilt makes itself noisily heard in consciousness; it dominates the clinical picture and the patient's life as well, and it hardly allows anything else to appear alongside of it. But in most other cases and forms of neurosis it remains completely unconscious, without on that account producing any less important effects. Our patients do not believe us when we attribute an 'unconscious sense of guilt' to them. In order to make ourselves at all intelligible to them, we tell them of an unconscious need for punishment, in which the sense of guilt finds expression. But its connection with a particular form of neurosis must not be over-estimated. Even in obsessional neurosis there are types of patients who are not aware of their sense of guilt, or who only feel it as a tormenting uneasiness, a kind of anxiety, if they are prevented from carrying out certain actions. It ought to be possible eventually to understand these things; but as yet we cannot. Here perhaps we may be glad to have it pointed out that the sense of guilt is at bottom nothing else but a topographical variety of anxiety; in its later phases it coincides completely with *fear of the super-ego*. And the relations of anxiety to consciousness exhibit the same extraordinary variations. Anxiety is always present somewhere or other behind every symptom; but at one time it takes noisy possession of the whole of consciousness, while at another it conceals itself so completely that we are obliged to speak of unconscious anxiety or, if we want to have a clearer psychological conscience, since anxiety is in the first instance simply a feeling, of possibilities of anxiety. Consequently it is very conceivable that the sense of guilt produced by civilization is not perceived as such either, and remains to a large extent unconscious, or appears as a sort of *malaise*, a dissatisfaction, for which people seek other motivations. Religions, at any rate, have never overlooked the part played in civilization by a sense of guilt. Furthermore - a point which I failed to appreciate elsewhere² - they claim to redeem mankind from this sense of guilt, which they call sin. From the manner in which, in Christianity, this redemption is achieved - by the sacrificial death of a single person, who in this manner takes upon himself a guilt that is common to everyone - we have been able to infer what the first occasion may have been on which this primal guilt, which was also the beginning of civilization, was acquired.³

¹ 'Thus conscience does make cowards of us all . . .'

That the education of young people at the present day conceals from them the part which sexuality will play in their lives is not the only reproach which we are obliged to make against it. Its other sin is that it does not prepare them for the aggressiveness of which they are destined to become the objects. In sending the young out into life with such a false psychological orientation, education is behaving as though one were to equip people starting on a Polar expedition with summer clothing and maps of the Italian Lakes. In this it becomes evident that a certain misuse is being made of ethical demands. The strictness of those demands would not do so much harm if education were to say: 'This is how men ought to be, in order to be happy and to make others happy; but you have to reckon on their not being like that.' Instead of this the young are made to believe that everyone else fulfils those ethical demands - that is, that everyone else is virtuous. It is on this that the demand is based that the young, too, shall become virtuous.

² In *The Future of an Illusion* (1927c)

³ *Totem and Taboo* (1912-13).

Though it cannot be of great importance, it may not be superfluous to elucidate the meaning of a few words such as 'super-ego', 'conscience', 'sense of guilt', 'need for punishment' and 'remorse', which we have often, perhaps, used too loosely and interchangeably. They all relate to the same state of affairs, but denote different aspects of it. The super-ego is an agency which has been inferred by us, and conscience is a function which we ascribe, among other functions, to that agency. This function consists in keeping a watch over the actions and intentions of the ego and judging them, in exercising a censorship. The sense of guilt, the harshness of the super-ego, is thus the same thing as the severity of the conscience. It is the perception which the ego has of being watched over in this way, the assessment of the tension between its own strivings and the demands of the super-ego. The fear of this critical agency (a fear which is at the bottom of the whole relationship), the need for punishment, is an instinctual manifestation on the part of the ego, which has become masochistic under the influence of a sadistic super-ego; it is a portion, that is to say, of the instinct towards internal destruction present in the ego, employed for forming an erotic attachment to the super-ego. We ought not to speak of a conscience until a super-ego is demonstrably present. As to a sense of guilt, we must admit that it is in existence before the super-ego, and therefore before conscience, too. At that time it is the immediate expression of fear of the external authority, a recognition of the tension between the ego and that authority. It is the direct derivative of the conflict between the need for the authority's love and the urge towards instinctual satisfaction, whose inhibition produces the inclination to aggression. The superimposition of these two strata of the sense of guilt - one coming from fear of the *external* authority, the other from fear of the *internal* authority - has hampered our insight into the position of conscience in a number of ways. Remorse is a general term for the ego's reaction in a case of sense of guilt. It contains, in little altered form, the sensory material of the anxiety which is operating behind the sense of guilt; it is itself a punishment and can include the need for punishment. Thus remorse, too, can be older than conscience.

Nor will it do any harm if we once more review the contradictions which have for a while perplexed us during our enquiry. Thus, at one point the sense of guilt was the consequence of acts of aggression that had been abstained from; but at another point - and precisely at its historical beginning, the killing of the father - it was the consequence of an act of aggression that had been carried out. But a way out of this difficulty was found. For the institution of the internal authority, the super-ego, altered the situation radically. Before this, the sense of guilt coincided with remorse. (We may remark, incidentally, that the term 'remorse' should be reserved for the reaction after an act of aggression has actually been carried out.) After this, owing to the omniscience of the super-ego, the difference between an aggression intended and an aggression carried out lost its force. Henceforward a sense of guilt could be produced not only by an act of violence that is actually carried out (as all the world knows), but also by one that is merely intended (as psycho-analysis has discovered). Irrespectively of this alteration in the psychological situation, the conflict arising from ambivalence - the conflict between the two primal instincts - leaves the same result behind. We are tempted to look here for the solution of the problem of the varying relation in which the sense of guilt stands to consciousness. It might be thought that a sense of guilt arising from remorse for an evil *deed* must always be conscious, whereas a sense of guilt arising from the perception of an evil *impulse* may remain unconscious. But the answer is not so simple as that. Obsessional neurosis speaks energetically against it.

The second contradiction concerned the aggressive energy with which we suppose the super-ego to be endowed. According to one view, that energy merely carries on the punitive energy of the external authority and keeps it alive in the mind; while, according to another view, it consists, on the contrary, of one's own aggressive energy which has not been used and which one now directs against that inhibiting authority. The first view seemed to fit in better with the *history*, and the second with the *theory*, of the sense of guilt. Closer reflection has resolved this apparently irreconcilable contradiction almost too completely; what remained as the essential and common factor was that in each case we were dealing with an aggressiveness which had been displaced inwards. Clinical observation, moreover, allows us in fact to distinguish two sources for the aggressiveness which we attribute to the super-ego; one or the other of them exercises the stronger effect in any given case, but as a general rule they operate in unison.

This is, I think, the place at which to put forward for serious consideration a view which I have earlier recommended for provisional acceptance. In the most recent analytic literature a predilection is shown for the idea that any kind of frustration, any thwarted instinctual satisfaction, results, or may result, in a heightening of the sense of guilt.¹ A great theoretical simplification will, I think, be achieved if we regard this as applying only to the *aggressive* instincts, and little will be found to contradict this assumption. For how are we to account, on dynamic and economic grounds, for an increase in the sense of guilt appearing in place of an unfulfilled *erotic* demand? This only seems possible in a round-about way - if we suppose, that is, that the prevention of an erotic satisfaction calls up a piece of aggressiveness against the person who has interfered with the satisfaction, and that this aggressiveness has itself to be suppressed in turn. But if this is so, it is after all only the aggressiveness which is transformed into a sense of guilt, by being suppressed and made over to the super-ego. I am convinced that many processes will admit of a simpler and clearer exposition if the findings of psycho-analysis with regard to the derivation of the sense of guilt are restricted to the aggressive instincts. Examination of the clinical material gives us no unequivocal answer here, because, as our hypothesis tells us, the two classes of instinct hardly ever appear in a pure form, isolated from each other; but an investigation of extreme cases would probably point in the direction I anticipate.

¹ This view is taken in particular by Ernest Jones, Susan Isaacs and Melanie Klein; and also, I understand, by Reik and Alexander.

I am tempted to extract a first advantage from this more restricted view of the case by applying it to the process of repression. As we have learned, neurotic symptoms are, in their essence, substitutive satisfactions for unfulfilled sexual wishes. In the course of our analytic work we have discovered to our surprise that perhaps every neurosis conceals a quota of unconscious sense of guilt, which in its turn fortifies the symptoms by making use of them as a punishment. It now seems plausible to formulate the following proposition. When an instinctual trend undergoes repression, its libidinal elements are turned into symptoms, and its aggressive components into a sense of guilt. Even if this proposition is only an average approximation to the truth, it is worthy of our interest.

Some readers of this work may further have an impression that they have heard the formula of the struggle between Eros and the death instinct too often. It was alleged to characterize the process of civilization which mankind undergoes but it was also brought into connection with the development of the individual, and, in addition, it was said to have revealed the secret of organic life in general. We cannot, I think, avoid going into the relations of these three processes to one another. The repetition of the same formula is justified by the consideration that both the process of human civilization and of the development of the individual are also vital processes - which is to say that they must share in the most general characteristic of life. On the other hand, evidence of the presence of this general characteristic fails, for the very reason of its general nature, to help us to arrive at any differentiation, so long as it is not narrowed down by special qualifications. We can only be satisfied, therefore, if we assert that the process of civilization is a modification which the vital process experiences under the influence of a task that is set it by Eros and instigated by Ananke - by the exigencies of reality; and that this task is one of uniting separate individuals into a community bound together by libidinal ties. When, however, we look at the relation between the process of human civilization and the developmental or educative process of individual human beings, we shall conclude without much hesitation that the two are very similar in nature, if not the very same process applied to different kinds of object. The process of the civilization of the human species is, of course, an abstraction of a higher order than is the development of the individual and it is therefore harder to apprehend in concrete terms, nor should we pursue analogies to an obsessional extreme; but in view of the similarity between the aims of the two processes - in the one case the integration of a separate individual into a human group, and in the other case the creation of a unified group out of many individuals - we cannot be surprised at the similarity between the means employed and the resultant phenomena.

In view of its exceptional importance, we must not long postpone the mention of one feature which distinguishes between the two processes. In the developmental process of the individual, the programme of the pleasure principle, which consists in finding the satisfaction of happiness, is retained as the main aim. Integration in, or adaptation to, a human community appears as a scarcely avoidable condition which must be fulfilled before this aim of happiness can be achieved. If it could be done without that condition, it would perhaps be preferable. To put it in other words, the development of the individual seems to us to be a product of the interaction between two urges, the urge towards happiness, which we usually call 'egoistic', and the urge towards union with others in the community, which we call 'altruistic'. Neither of these descriptions goes much below the surface. In the process of individual development, as we have said, the main accent falls mostly on the egoistic urge (or the urge towards happiness); while the other urge, which may be described as a 'cultural' one, is usually content with the role of imposing restrictions. But in the process of civilization things are different. Here by far the most important thing is the aim of creating a unity out of the individual human beings. It is true that the aim of happiness is still there, but it is pushed into the background. It almost seems as if the creation of a great human community would be most successful if no attention had to be paid to the happiness of the individual. The developmental process of the individual can thus be expected to have special features of its own which are not reproduced in the process of human civilization. It is only in so far as the first of these processes has union with the community as its aim that it need coincide with the second process.

Just as a planet revolves around a central body as well as rotating on its own axis, so the human individual takes part in the course of development of mankind at the same time as he pursues his own path in life. But to our dull eyes the play of forces in the heavens seems fixed in a never-changing order; in the field of organic life we can still see how the forces contend with one another, and how the effects of the conflict are continually changing. So, also, the two urges, the one towards personal happiness and the other towards union with other human beings, must struggle with each other in every individual; and so, also, the two processes of individual and of cultural development must stand in hostile opposition to each other and mutually dispute the ground. But this struggle between the individual and society is not a derivative of the contradiction - probably an irreconcilable one - between the primal instincts of Eros and death. It is a dispute within the economics of the libido, comparable to the contest concerning the distribution of libido between ego and objects; and it does admit of an eventual accommodation in the individual, as, it may be hoped, it will also do in the future of civilization, however much that civilization may oppress the life of the individual to-day.

The analogy between the process of civilization and the path of individual development may be extended in an important respect. It can be asserted that the community, too, evolves a super-ego under whose influence cultural development proceeds. It would be a tempting task for anyone who has a knowledge of human civilizations to follow out this analogy in detail. I will confine myself to bringing forward a few striking points. The super-ego of an epoch of civilization has an origin similar to that of an individual. It is based on the impression left behind by the personalities of great leaders - men of overwhelming force of mind or men in whom one of the human impulses has found its strongest and purest, and therefore often its most one-sided, expression. In many instances the analogy goes still further, in that during their lifetime these figures were - often enough, even if not always - mocked and maltreated by others and even despatched in a cruel fashion. In the same way, indeed, the primal father did not attain divinity until long after he had met his death by violence. The most arresting example of this fateful conjunction is to be seen in the figure of Jesus Christ - if, indeed, that figure is not a part of mythology, which called it into being from an obscure memory of that primal event. Another point of agreement between the cultural and the individual super-ego is that the former, just like the latter, sets up strict ideal demands, disobedience to which is visited with 'fear of conscience'. Here, indeed, we come across the remarkable circumstance that the mental processes concerned are actually more familiar to us and more accessible to consciousness as they are seen in the group than they can be in the individual man. In him, when tension arises, it is only the aggressiveness of the super-ego which, in the form of reproaches, makes itself noisily heard; its actual demands often remain unconscious in the background. If we bring them to conscious knowledge, we find that they coincide with the precepts of the prevailing cultural super-ego. At this point the two processes, that of the cultural development of the group and that of the cultural development of the individual, are, as it were, always interlocked. For that reason some of the manifestations and properties of the super-ego can be more easily detected in its behaviour in the cultural community than in the separate individual.

The cultural super-ego has developed its ideals and set up its demands. Among the latter, those which deal with the relations of human beings to one another are comprised under the heading of ethics. People have at all times set the greatest value on ethics, as though they expected that it in particular would produce especially important results. And it does in fact deal with a subject which can easily be recognized as the sorest spot in every civilization. Ethics is thus to be regarded as a therapeutic attempt - as an endeavour to achieve, by means of a command of the super-ego, something which has so far not been achieved by means of any other cultural activities. As we already know, the problem before us is how to get rid of the greatest hindrance to civilization - namely, the constitutional inclination of human beings to be aggressive towards one another; and for that very reason we are especially interested in what is probably the most recent of the cultural commands of the super-ego, the commandment to love one's neighbour as oneself. In our research into, and therapy of, a neurosis, we are led to make two reproaches against the super-ego of the individual. In the severity of its commands and prohibitions it troubles itself too little about the happiness of the ego, in that it takes insufficient account of the resistances against obeying them - of the instinctual strength of the id, and of the difficulties presented by the real external environment. Consequently we are very often obliged, for therapeutic purposes, to oppose the super-ego, and we endeavour to lower its demands. Exactly the same objections can be made against the ethical demands of the cultural super-ego. It, too, does not trouble itself enough about the facts of the mental constitution of human beings. It issues a command and does not ask whether it is possible for people to obey it. On the contrary, it assumes that a man's ego is psychologically capable of anything that is required of it, that his ego has unlimited mastery over his id. This is a mistake; and even in what are known as normal people the id cannot be controlled beyond certain limits. If more is demanded of a man, a revolt will be produced in him or a neurosis, or he will be made unhappy. The commandment, 'Love thy neighbour as thyself', is the strongest defence against human aggressiveness and an excellent example of the unpsychological proceedings of the cultural super-ego. The commandment is impossible to fulfil; such an enormous inflation of love can only lower its value, not get rid of the difficulty. Civilization pays no attention to all this; it merely admonishes us that the harder it is to obey the precept the more meritorious it is to do so. But anyone who follows such a precept in present-day civilization only puts himself at a disadvantage *vis-à-vis* the person who disregards it. What a potent obstacle to civilization aggressiveness must be, if the defence against it can cause as much unhappiness as aggressiveness itself! 'Natural' ethics, as it is called, has nothing to offer here except the narcissistic satisfaction of being able to think oneself better than others. At this point the ethics based on religion introduces its promises of a better after-life. But so long as virtue is not rewarded here on earth, ethics will, I fancy, preach in vain. I too think it quite certain that a real change in the relations of human beings to possessions would be of more help in this direction than any ethical commands; but the recognition of this fact among socialists has been obscured and made useless for practical purposes by a fresh idealistic misconception of human nature.

I believe the line of thought which seeks to trace in the phenomena of cultural development the part played by a super-ego promises still further discoveries. I hasten to come to a close. But there is one question which I can hardly evade. If the development of civilization has such a far-reaching similarity to the development of the individual and if it employs the same methods, may we not be justified in reaching the diagnosis that, under the influence of cultural urges, some civilizations, or some epochs of civilization - possibly the whole of mankind - have become 'neurotic'? An analytic dissection of such neuroses might lead to therapeutic recommendations which could lay claim to great practical interest. I would not say that an attempt of this kind to carry psycho-analysis over to the cultural community was absurd or doomed to be fruitless. But we should have to be very cautious and not forget that, after all, we are only dealing with analogies and that it is dangerous, not only with men but also with concepts, to tear them from the sphere in which they have originated and been evolved. Moreover, the diagnosis of communal neuroses is faced with a special difficulty. In an individual neurosis we take as our starting-point the contrast that distinguishes the patient from his environment, which is assumed to be 'normal'. For a group all of whose members are affected by one and the same disorder no such background could exist; it would have to be found elsewhere. And as regards the therapeutic application of our knowledge, what would be the use of the most correct analysis of social neuroses, since no one possesses authority to impose such a therapy upon the group? But in spite of all these difficulties, we may expect that one day someone will venture to embark upon a pathology of cultural communities.

For a wide variety of reasons, it is very far from my intention to express an opinion upon the value of human civilization. I have endeavoured to guard myself against the enthusiastic prejudice which holds that our civilization is the most precious thing that we possess or could acquire and that its path will necessarily lead to heights of unimagined perfection. I can at least listen without indignation to the critic who is of the opinion that when one surveys the aims of cultural endeavour and the means it employs, one is bound to come to the conclusion that the whole effort is not worth the trouble, and that the outcome of it can only be a state of affairs which the individual will be unable to tolerate. My impartiality is made all the easier to me by my knowing very little about all these things. One thing only do I know for certain and that is that man's judgements of value follow directly his wishes for happiness - that, accordingly, they are an attempt to support his illusions with arguments. I should find it very understandable if someone were to point out the obligatory nature of the course of human civilization and were to say, for instance, that the tendencies to a restriction of sexual life or to the institution of a humanitarian ideal at the expense of natural selection were developmental trends which cannot be averted or turned aside and to which it is best for us to yield as though they were necessities of nature. I know, too, the objection that can be made against this, to the effect that in the history of mankind, trends such as these, which were considered unsurmountable, have often been thrown aside and replaced by other trends. Thus I have not the courage to rise up before my fellow-men as a prophet, and I bow to their reproach that I can offer them no consolation: for at bottom that is what they are all demanding - the wildest revolutionaries no less passionately than the most virtuous believers.

The fateful question for the human species seems to me to be whether and to what extent their cultural development will succeed in mastering the disturbance of their communal life by the human instinct of aggression and self-destruction. It may be that in this respect precisely the present time deserves a special interest. Men have gained control over the forces of nature to such an extent that with their help they would have no difficulty in exterminating one another to the last man. They know this, and hence comes a large part of their current unrest, their unhappiness and their mood of anxiety. And now it is to be expected that the other of the two 'Heavenly Powers', eternal Eros, will make an effort to assert himself in the struggle with his equally immortal adversary. But who can foresee with what success and with what result?

FETISHISM
(1927)

Intentionally left blank

FETISHISM

In the last few years I have had an opportunity of studying analytically a number of men whose object-choice was dominated by a fetish. There is no need to expect that these people came to analysis on account of their fetish. For though no doubt a fetish is recognized by its adherents as an abnormality, it is seldom felt by them as the symptom of an ailment accompanied by suffering. Usually they are quite satisfied with it, or even praise the way in which it eases their erotic life. As a rule, therefore, the fetish made its appearance in analysis as a subsidiary finding.

For obvious reasons the details of these cases must be withheld from publication; I cannot, therefore, show in what way accidental circumstances have contributed to the choice of a fetish. The most extraordinary case seemed to me to be one in which a young man had exalted a certain sort of 'shine on the nose' into a fetishistic precondition. The surprising explanation of this was that the patient had been brought up in an English nursery but had later come to Germany, where he forgot his mother-tongue almost completely. The fetish, which originated from his earliest childhood, had to be understood in English, not German. The 'shine on the nose' - was in reality a '*glance* at the nose'. The nose was thus the fetish, which, incidentally, he endowed at will with the luminous shine which was not perceptible to others.

In every instance, the meaning and the purpose of the fetish turned out, in analysis, to be the same. It revealed itself so naturally and seemed to me so compelling that I am prepared to expect the same solution in all cases of fetishism. When now I announce that the fetish is a substitute for the penis, I shall certainly create disappointment; so I hasten to add that it is not a substitute for any chance penis, but for a particular and quite special penis that had been extremely important in early childhood but had later been lost. That is to say, it should normally have been given up, but the fetish is precisely designed to preserve it from extinction. To put it more plainly: the fetish is a substitute for the woman's (the mother's) penis that the little boy once believed in and - for reasons familiar to us - does not want to give up.¹

¹ This interpretation was made as early as 1910, in my study on Leonardo da Vinci, without any reasons being given for it.

What happened, therefore, was that the boy refused to take cognizance of the fact of his having perceived that a woman does not possess a penis. No, that could not be true: for if a woman had been castrated, then his own possession of a penis was in danger; and against that there rose in rebellion the portion of his narcissism which Nature has, as a precaution, attached to that particular organ. In later life a grown man may perhaps experience a similar panic when the cry goes up that Throne and Altar are in danger, and similar illogical consequences will ensue. If I am not mistaken, Laforgue would say in this case that the boy 'scotomizes' his perception of the woman's lack of a penis.¹ A new technical term is justified when it describes a new fact or emphasizes it. This is not so here. The oldest word in our psycho-analytic terminology, 'repression', already relates to this pathological process. If we wanted to differentiate more sharply between the vicissitude of the *idea* as distinct from that of the *affect*, and reserve the word '*Verdrängung*' ['repression'] for the affect, then the correct German word for the vicissitude of the idea would be '*Verleugnung*' ['disavowal']. 'Scotomization' seems to me particularly unsuitable, for it suggests that the perception is entirely wiped out, so that the result is the same as when a visual impression falls on the blind spot in the retina. In the situation we are considering, on the contrary, we see that the perception has persisted, and that a very energetic action has been undertaken to maintain the disavowal. It is not true that, after the child has made his observation of the woman, he has preserved unaltered his belief that women have a phallus. He has retained that belief, but he has also given it up. In the conflict between the weight of the unwelcome perception and the force of his counter-wish, a compromise has been reached, as is only possible under the dominance of the unconscious laws of thought - the primary processes. Yes, in his mind the woman *has* got a penis, in spite of everything; but this penis is no longer the same as it was before. Something else has taken its place, has been appointed its substitute, as it were, and now inherits the interest which was formerly directed to its predecessor. But this interest suffers an extraordinary increase as well, because the horror of castration has set up a memorial to itself in the creation of this substitute. Furthermore, an aversion, which is never absent in any fetishist, to the real female genitals remains a *stigma indelebile* of the repression that has taken place. We can now see what the fetish achieves and what it is that maintains it. It remains a token of triumph over the threat of castration and a protection against it. It also saves the fetishist from becoming a homosexual, by endowing women with the characteristic which makes them tolerable as sexual objects. In later life, the fetishist feels that he enjoys yet another advantage from his substitute for a genital. The meaning of the fetish is not known to other people, so the fetish is not withheld from him: it is easily accessible and he can readily obtain the sexual satisfaction attached to it. What other men have to woo and make exertions for can be had by the fetishist with no trouble at all.

¹ I correct myself, however, by adding that I have the best reasons for supposing that Laforgue would not say anything of the sort. It is clear from his own remarks that 'scotomization' is a term which derives from descriptions of dementia praecox, which does not arise from a carrying-over of psycho-analytic concepts to the psychoses and which has no application to developmental processes or to the formation of neuroses. In his exposition in the text of his paper, the author has been at pains to make this incompatibility clear.

Probably no male human being is spared the fright of castration at the sight of a female genital. Why some people become homosexual as a consequence of that impression, while others fend it off by creating a fetish, and the great majority surmount it, we are frankly not able to explain. It is possible that, among all the factors at work, we do not yet know those which are decisive for the rare pathological results. We must be content if we can explain what has happened, and may for the present leave on one side the task of explaining why something has *not* happened.

One would expect that the organs or objects chosen as substitutes for the absent female phallus would be such as appear as symbols of the penis in other connections as well. This may happen often enough, but is certainly not a deciding factor. It seems rather that when the fetish is instituted some process occurs which reminds one of the stopping of memory in traumatic amnesia. As in this latter case, the subject's interest comes to a halt half-way, as it were; it is as though the last impression before the uncanny and traumatic one is retained as a fetish. Thus the foot or shoe owes its preference as a fetish - or a part of it - to the circumstance that the inquisitive boy peered at the woman's genitals from below, from her legs up; fur and velvet - as has long been suspected - are a fixation of the sight of the pubic hair, which should have been followed by the longed-for sight of the female member; pieces of underclothing, which are so often chosen as a fetish, crystallize the moment of undressing, the last moment in which the woman could still be regarded as phallic. But I do not maintain that it is invariably possible to discover with certainty how the fetish was determined.

An investigation of fetishism is strongly recommended to any one who still doubts the existence of the castration complex or who can still believe that fright at the sight of the female genital has some other ground - for instance, that it is derived from a supposed recollection of the trauma of birth.

For me, the explanation of fetishism had another point of theoretical interest as well. Recently, along quite speculative lines, I arrived at the proposition that the essential difference between neurosis and psychosis was that in the former the ego, in the service of reality, suppresses a piece of the id, whereas in a psychosis it lets itself be induced by the id to detach itself from a piece of reality. I returned to this theme once again later on.¹ But soon after this I had reason to regret that I had ventured so far. In the analysis of two young men I learned that each - one when he was two years old and the other when he was ten - had failed to take cognizance of the death of his beloved father - had 'scotomized' it - and yet neither of them had developed a psychosis. Thus a piece of reality which was undoubtedly important had been disavowed by the ego, just as the unwelcome fact of women's castration is disavowed in fetishists. I also began to suspect that similar occurrences in childhood are by no means rare, and I believed that I had been guilty of an error in my characterization of neurosis and psychosis. It is true that there was one way out of the difficulty. My formula needed only to hold good where there was a higher degree of differentiation in the psychical apparatus; things might be permissible to a child which would entail severe injury to an adult.

¹ 'Neurosis and Psychosis' (1924*b*) and 'The Loss of Reality in Neurosis and Psychosis' (1924*e*).

But further research led to another solution of the contradiction. It turned out that the two young men had no more 'scotomized' their father's death than a fetishist does the castration of women. It was only one current in their mental life that had not recognized their father's death; there was another current which took full account of that fact. The attitude which fitted in with the wish and the attitude which fitted in with reality existed side by side. In one of my two cases this split had formed the basis of a moderately severe obsessional neurosis. The patient oscillated in every situation in life between two assumptions: the one, that his father was still alive and was hindering his activities; the other, opposite one, that he was entitled to regard himself as his father's successor. I may thus keep to the expectation that in a psychosis the one current - that which fitted in with reality - would have in fact been absent.

Returning to my description of fetishism, I may say that there are many and weighty additional proofs of the divided attitude of fetishists to the question of the castration of women. In very subtle instances both the disavowal and the affirmation of the castration have found their way into the construction of the fetish itself. This was so in the case of a man whose fetish was an athletic support-belt which could also be worn as bathing drawers. This piece of clothing covered up the genitals entirely and concealed the distinction between them. Analysis showed that it signified that women were castrated and that they were not castrated; and it also allowed of the hypothesis that men were castrated, for all these possibilities could equally well be concealed under the belt - the earliest rudiment of which in his childhood had been the fig-leaf on a statue. A fetish of this sort, doubly derived from contrary ideas, is of course especially durable. In other instances the divided attitude shows itself in what the fetishist does with his fetish, whether in reality or in his imagination. To point out that he reveres his fetish is not the whole story; in many cases he treats it in a way which is obviously equivalent to a representation of castration. This happens particularly if he has developed a strong identification with his father and plays the part of the latter; for it is to him that as a child he ascribed the woman's castration. Affection and hostility in the treatment of the fetish - which run parallel with the disavowal and the acknowledgement of castration - are mixed in unequal proportions in different cases, so that the one or the other is more clearly recognizable. We seem here to approach an understanding, even if a distant one, of the behaviour of the '*coupeur de nattes*'. In him the need to carry out the castration which he disavows has come to the front. His action contains in itself the two mutually incompatible assertions: 'the woman has still got a penis' and 'my father has castrated the woman'. Another variant, which is also a parallel to fetishism in social psychology, might be seen in the Chinese custom of mutilating the female foot and then revering it like a fetish after it has been mutilated. It seems as though the Chinese male wants to thank the woman for having submitted to being castrated.

In conclusion we may say that the normal prototype of fetishes is a man's penis, just as the normal prototype of inferior organs is a woman's real small penis, the clitoris.

HUMOUR

In my volume on *Jokes and their Relation to the Unconscious* (1905c), I in fact considered humour only from the economic point of view. My object was to discover the source of the pleasure obtained from humour, and I think I was able to show that the yield of humorous pleasure arises from an economy in expenditure upon feeling.

There are two ways in which the humorous process can take place. It may take place in regard to a single person, who himself adopts the humorous attitude, while a second person plays the part of the spectator who derives enjoyment from it; or it may take place between two persons, of whom one takes no part at all in the humorous process, but is made the object of humorous contemplation by the other. When, to take the crudest example, a criminal who was being led out to the gallows on a Monday remarked: 'Well, the week's beginning nicely', he was producing the humour himself; the humorous process is completed in his own person and obviously affords him a certain sense of satisfaction. I, the non-participating listener, am affected as it were at long-range by this humorous production of the criminal's; I feel, like him, perhaps, the yield of humorous pleasure.

We have an instance of the second way in which humour arises when a writer or a narrator describes the behaviour of real or imaginary people in a humorous manner. There is no need for those people to display any humour themselves; the humorous attitude is solely the business of the person who is taking them as his object; and, as in the former instance, the reader or hearer shares in the enjoyment of the humour. To sum up, then, we can say that the humorous attitude - whatever it may consist in - can be directed either towards the subject's own self or towards other people; it is to be assumed that it brings a yield of pleasure to the person who adopts it, and a similar yield of pleasure falls to the share of the non-participating onlooker.

We shall best understand the genesis of the yield of humorous pleasure if we consider the process in the listener before whom someone else produces humour. He sees this other person in a situation which leads the listener to expect that the other will produce the signs of an affect - that he will get angry, complain, express pain, be frightened or horrified or perhaps even in despair; and the onlooker or listener is prepared to follow his lead and to call up the same emotional impulses in himself. But this emotional expectancy is disappointed; the other person expresses no affect, but makes a jest. The expenditure on feeling that is economized turns into humorous pleasure in the listener.

It is easy to get so far. But we soon tell ourselves that it is the process which takes place in the other person - the 'humorist' - that merits the greater attention. There is no doubt that the essence of humour is that one spares oneself the affects to which the situation would naturally give rise and dismisses the possibility of such expressions of emotion with a jest. As far as this goes, the process in the humorist must tally with the process in the hearer - or, to put it more correctly, the process in the hearer must have copied the one in the humorist. But how does the latter bring about the mental attitude which makes a release of affect superfluous? What are the dynamics of his adoption of the 'humorous attitude'? Clearly, the solution of the problem is to be sought in the humorist; in the hearer we must assume that there is only an echo, a copy, of this unknown process.

It is now time to acquaint ourselves with a few of the characteristics of humour. Like jokes and the comic, humour has something liberating about it; but it also has something of grandeur and elevation, which is lacking in the other two ways of obtaining pleasure from intellectual activity. The grandeur in it clearly lies in the triumph of narcissism, the victorious assertion of the ego's invulnerability. The ego refuses to be distressed by the provocations of reality, to let itself be compelled to suffer. It insists that it cannot be affected by the traumas of the external world; it shows, in fact, that such traumas are no more than occasions for it to gain pleasure. This last feature is a quite essential element of humour. Let us suppose that the criminal who was being led to execution on Monday had said: 'It doesn't worry me. What does it matter, after all, if a fellow like me is hanged? The world won't come to an end because of it.' We should have to admit that such a speech does in fact display the same magnificent superiority over the real situation. It is wise and true; but it does not betray a trace of humour. Indeed, it is based on an appraisal of reality which runs directly counter to the appraisal made by humour. Humour is not resigned; it is rebellious. It signifies not only the triumph of the ego but also of the pleasure principle, which is able here to assert itself against the unkindness of the real circumstances.

These last two features - the rejection of the claims of reality and the putting though of the pleasure principle - bring humour near to the regressive or reactionary processes which engage our attention so extensively in psychopathology. Its fending off of the possibility of suffering places it among the great series of methods which the human mind has constructed in order to evade the compulsion to suffer - a series which begins with neurosis and culminates in madness and which includes intoxication, self-absorption and ecstasy. Thanks to this connection, humour possesses a dignity which is wholly lacking, for instance, in jokes, for jokes either serve simply to obtain a yield of pleasure or place the yield of pleasure that has been obtained in the service of aggression. In what, then, does the humorous attitude consist, an attitude by means of which a person refuses to suffer, emphasizes the invincibility of his ego by the real world, victoriously maintains the pleasure principle - and all this, in contrast to other methods having the same purposes, without overstepping the bounds of mental health? The two achievements seem incompatible.

If we turn to the situation in which one person adopts a humorous attitude towards others, a view which I have already put forward tentatively in my book on jokes will at once suggest itself. This is that the subject is behaving towards them as an adult does towards a child when he recognizes and smiles at the triviality of interests and sufferings which seem so great to it. Thus the humorist would acquire his superiority by assuming the role of the grown-up and identifying himself to some extent with his father, and reducing the other people to being children. This view probably covers the facts, but it hardly seems a conclusive one. One asks oneself what it is that makes the humorist arrogate this role to himself.

But we must recall the other, probably more primary and important, situation of humour, in which a person adopts a humorous attitude towards himself in order to ward off possible suffering. Is there any sense in saying that someone is treating himself like a child and is at the same time playing the part of a superior adult towards that child?

This not very plausible idea receives strong support, I think, if we consider what we have learned from pathological observations on the structure of the ego. This ego is not a simple entity. It harbours within it, as its nucleus, a special agency the super-ego. Sometimes it is merged with the super-ego so that we cannot distinguish between them, whereas in other circumstances it is sharply differentiated from it. Genetically the super-ego is the heir to the parental agency. It often keeps the ego in strict dependence and still really treats it as the parents, or the father, once treated the child, in its early years. We obtain a dynamic explanation of the humorous attitude, therefore, if we assume that it consists in the humorist's having withdrawn the psychical accent from his ego and having transposed it on to his super-ego. To the super-ego, thus inflated, the ego can appear tiny and all its interests trivial; and, with this new distribution of energy, it may become an easy matter for the super-ego to suppress the ego's possibilities of reacting.

In order to remain faithful to our customary phraseology, we shall have to speak, not of transposing the psychical accent, but of displacing large amounts of cathexis. The question then is whether we are entitled to picture extensive displacements like this from one agency of the mental apparatus to another. It looks like a new hypothesis constructed *ad hoc*. Yet we may remind ourselves that we have repeatedly (even though not sufficiently often) taken a factor of this kind into account in our attempts at a metapsychological picture of mental events. Thus, for instance, we supposed that the difference between an ordinary erotic object-cathexis and the state of being in love is that in the latter incomparably more cathexis passes over to the object and that the ego empties itself as it were in favour of the object. In studying some cases of paranoia I was able to establish the fact that ideas of persecution are formed early and exist for a long time without any perceptible effect, until, as the result of some particular precipitating event, they receive sufficient amounts of cathexis to cause them to become dominant. The cure, too, of such paranoic attacks would lie not so much in a resolution and correction of the delusional ideas as in a withdrawal from them of the cathexis which has been lent to them. The alternations between melancholia and mania, between a cruel suppression of the ego by the super-ego and a liberation of the ego after that pressure, suggests a shift of cathexis of this kind; such a shift, moreover, would have to be brought in to explain a whole number of phenomena belonging to normal mental life. If this has been done hitherto only to a very limited extent, that is on account of our usual caution - something which deserves only praise. The region in which we feel secure is that of the pathology of mental life; it is here that we make our observations and acquire our convictions. For the present we venture to form a judgement on the normal mind only in so far as we can discern what is normal in the isolations and distortions of the pathological material. When once we have overcome this hesitancy we shall recognize what a large contribution is made to the understanding of mental processes by the static conditions as well as by the dynamic changes in the *quantity* of energetic cathexis.

I think, therefore, that the possibility I have suggested here, that in a particular situation the subject suddenly hypercathects his super-ego and then, proceeding from it, alters the reactions of the ego, is one which deserves to be retained. Moreover, what I have suggested about humour finds a remarkable analogy in the kindred field of jokes. As regards the origin of jokes I was led to assume that a preconscious thought is given over for a moment to unconscious revision. A joke is thus the contribution made to the comic by the unconscious. In just the same way, *humour would be the contribution made to the comic through the agency of the super-ego.*

In other connections we knew the super-ego as a severe master. It will be said that it accords ill with such a character that the super-ego should condescend to enabling the ego to obtain a small yield of pleasure. It is true that humorous pleasure never reaches the intensity of the pleasure in the comic or in jokes, that it never finds vent in hearty laughter. It is also true that, in bringing about the humorous attitude, the super-ego is actually repudiating reality and serving an illusion. But (without rightly knowing why) we regard this less intense pleasure as having a character of very high value; we feel it to be especially liberating and elevating. Moreover, the jest made by humour is not the essential thing. It has only the value of a preliminary. The main thing is the intention which humour carries out, whether it is acting in relation to the self or other people. It means: 'Look! here is the world, which seems so dangerous! It is nothing but a game for children - just worth making a jest about!'

If it is really the super-ego which, in humour, speaks such kindly words of comfort to the intimidated ego, this will teach us that we have still a great deal to learn about the nature of the super-ego. Furthermore, not everyone is capable of the humorous attitude. It is a rare and precious gift, and many people are even without the capacity to enjoy humorous pleasure that is presented to them. And finally, if the super-ego tries, by means of humour, to console the ego and protect it from suffering, this does not contradict its origin in the parental agency.

A RELIGIOUS EXPERIENCE
(1928)

Intentionally left blank

A RELIGIOUS EXPERIENCE

In the autumn of 1927, G. S. Viereck, a German-American journalist who had paid me a welcome visit, published an account of a conversation with me, in the course of which he mentioned my lack of religious faith and my indifference on the subject of survival after death. This 'interview, as it was called, was widely read and brought me, among others, the following letter from an American physician:

'... What struck me most was your answer to the question whether you believe in a survival of personality after death. You are reported as having said: "I give no thought to the matter."

'I am writing now to tell you of an experience that I had in the year I graduated at the University of X. One afternoon while I was passing through the dissecting-room my attention was attracted to a sweet-faced dear old woman who was being carried to a dissecting-table. This sweet-faced woman made such an impression on me that a thought flashed up in my mind: "There is no God: if there were a God he would not have allowed this dear old woman to be brought into the dissecting room."

'When I got home that afternoon the feeling I had had at the sight in the dissecting-room had determined me to discontinue going to church. The doctrines of Christianity had before this been the subject of doubts in my mind.

'While I was meditating on this matter a voice spoke to my soul that "I should consider the step I was about to take". My spirit replied to this inner voice by saying, "If I knew of a certainty that Christianity was truth and the Bible was the Word of God, then I would accept it."

'In the course of the next few days God made it clear to my soul that the Bible was His Word, that the teachings about Jesus Christ were true, and that Jesus was our only hope. After such a clear revelation I accepted the Bible as God's Word and Jesus Christ as my personal Saviour. Since then God has revealed Himself to me by many infallible proofs.

'I beg you as a brother physician to give thought to this most important matter, and I can assure you, if you look into this subject with an open mind, God will reveal the *truth* to your soul, the same as he did to me and to multitudes of others. . . .'

I sent a polite answer, saying that I was glad to hear that this experience had enabled him to retain his faith. As for myself, God had not done so much for me. He had never allowed me to hear an inner voice; and if, in view of my age, he did not make haste, it would not be my fault if I remained to the end of my life what I now was - 'an infidel Jew'.

In the course of a friendly reply, my colleague gave me an assurance that being a Jew was not an obstacle in the pathway to true faith and proved this by several instances. His letter culminated in the information that prayers were being earnestly addressed to God that he might grant me 'faith to believe'.

I am still awaiting the outcome of this intercession. In the meantime, my colleague's religious experience provides food for thought. It seems to me to demand some attempt at an interpretation based upon emotional motives; for his experience is puzzling in itself and is based on particularly bad logic. God, as we know, allows horrors to take place of a kind very different from the removal to a dissecting-room of the dead body of a pleasant-looking old woman. This has been true at all times, and it must have been so while my American colleague was pursuing his studies. Nor, as a medical student, can he have been so sheltered from the world as to have known nothing of such evils. Why was it, then, that his indignation against God broke out precisely when he received this particular impression in the dissecting-room?

For anyone who is accustomed to regard men's internal experiences and actions analytically the explanation is very obvious - so obvious that it actually crept into my recollections of the facts themselves. Once, when I was referring to my pious colleague's letter in the course of a discussion, I spoke of his having written that the dead woman's face had reminded him of his own mother. In fact these words were not in his letter, and a moment's reflection will show that they could not possibly have been. But that is the explanation irresistibly forced on us by his affectionately phrased description of the 'sweet-faced dear old woman'. Thus the weakness of judgement displayed by the young doctor is to be accounted for by the emotion roused in him by the memory of his mother. It is difficult to escape from the bad psycho-analytic habit of bringing forward as evidence details which also allow of more superficial explanations - and I am tempted to recall the fact that my colleague addressed me later as a 'brother physician'.

We may suppose, therefore, that this was the way in which things happened. The sight of a woman's dead body, naked or on the point of being stripped, reminded the young man of his mother. It roused in him a longing for his mother which sprang from his Oedipus complex, and this was immediately completed by a feeling of indignation against his father. His ideas of 'father' and 'God' had not yet become widely separated; so that his desire to destroy his father could become conscious as doubt in the existence of God and could seek to justify itself in the eyes of reason as indignation about the ill-treatment of a mother object. It is of course typical for a child to regard what his father does to his mother in sexual intercourse as ill-treatment. The new impulse, which was displaced into the sphere of religion, was only a repetition of the Oedipus situation and consequently soon met with a similar fate. It succumbed to a powerful opposing current. During the actual conflict the level of displacement was not maintained: there is no mention of arguments in justification of God, nor are we told what the infallible signs were by which God proved his existence to the doubter. The conflict seems to have been unfolded in the form of a hallucinatory psychosis: inner voices were heard which uttered warnings against resistance to God. But the outcome of the struggle was displayed once again in the sphere of religion and it was of a kind predetermined by the fate of the Oedipus complex: complete submission to the will of God the Father. The young man became a believer and accepted everything he had been taught since his childhood about God and Jesus Christ. He had had a religious experience and had undergone a conversion.

All of this is so simple and straightforward that we cannot but ask ourselves whether by understanding this case we have thrown any light at all on the psychology of conversion in general. I may refer the reader to an admirable volume on the subject by Sante de Sanctis (1924), which incidentally takes all the findings of psycho-analysis into account. Study of this work confirms our expectation that by no means every case of conversion can be understood so easily as this one. In no respect, however, does our case contradict the views arrived at on the subject by modern research. The point which our present observation throws into relief is the manner in which the conversion was attached to a particular determining event, which caused the subject's scepticism to flare up for a last time before being finally extinguished.

DOSTOEVSKY AND PARRICIDE
(1928)

Intentionally left blank

DOSTOEVSKY AND PARRICIDE

Four facets may be distinguished in the rich personality of Dostoevsky: the creative artist, the neurotic, the moralist and the sinner. How is one to find one's way in this bewildering complexity?

The creative artist is the least doubtful: Dostoevsky's place is not far behind Shakespeare. *The Brothers Kamarazov* is the most magnificent novel ever written; the episode of the Grand Inquisitor, one of the peaks in the literature of the world, can hardly be valued too highly. Before the problem of the creative artist analysis must, alas, lay down its arms.

The moralist in Dostoevsky is the most readily assailable. If we seek to rank him high as a moralist on the plea that only a man who has gone through the depths of sin can reach the highest summit of morality, we are neglecting a doubt that arises. A moral man is one who reacts to temptation as soon as he feels it in his heart, without yielding to it. A man who alternately sins and then in his remorse erects high moral standards lays himself open to the reproach that he has made things too easy for himself. He has not achieved the essence of morality, renunciation, for the moral conduct of life is a practical human interest. He reminds one of the barbarians of the great migrations, who murdered and did penance for it, till penance became an actual technique for enabling murder to be done. Ivan the Terrible behaved in exactly this way; indeed this compromise with morality is a characteristic Russian trait. Nor was the final outcome of Dostoevsky's moral strivings anything very glorious. After the most violent struggles to reconcile the instinctual demands of the individual with the claims of the community, he landed in the retrograde position of submission both to temporal and spiritual authority, of veneration both for the Tsar and for the God of the Christians, and of a narrow Russian nationalism - a position which lesser minds have reached with smaller effort. This is the weak point in that great personality. Dostoevsky threw away the chance of becoming a teacher and liberator of humanity and made himself one with their gaolers. The future of human civilization will have little to thank him for. It seems probable that he was condemned to this failure by his neurosis. The greatness of his intelligence and the strength of his love for humanity might have opened to him another, an apostolic, way of life.

To consider Dostoevsky as a sinner or a criminal rouses violent opposition, which need not be based upon a philistine assessment of criminals. The real motive for this opposition soon becomes apparent. Two traits are essential in a criminal: boundless egoism and a strong destructive urge. Common to both of these, and a necessary condition for their expression, is absence of love, lack of an emotional appreciation of (human) objects. One at once recalls the contrast to this presented by Dostoevsky - his great need of love and his enormous capacity for love, which is to be seen in manifestations of exaggerated kindness and caused him to love and to help where he had a right to hate and to be revengeful, as, for example, in his relations with his first wife and her lover. That being so, it must be asked why there is any temptation to reckon Dostoevsky among the criminals. The answer is that it comes from his choice of material, which singles out from all others violent, murderous and egoistic characters, thus pointing to the existence of similar tendencies within himself, and also from certain facts in his life, like his passion for gambling and his possible confession to a sexual assault upon a young girl.¹ The contradiction is resolved by the realization that Dostoevsky's very strong destructive instinct, which might easily have made him a criminal, was in his actual life directed mainly against his own person (inward instead of outward) and thus found expression as masochism and a sense of guilt. Nevertheless, his personality retained sadistic traits in plenty, which show themselves in his irritability, his love of tormenting and his intolerance even towards people he loved, and which appear also in the way in which, as an author, he treats his readers. Thus in little things he was a sadist towards others, and in bigger things a sadist towards himself, in fact a masochist - that is to say the mildest, kindest, most helpful person possible.

¹ See the discussion of this in Fülöp-Miller and Eckstein (1926). Stefan Zweig (1920) writes: 'He was not halted by the barriers of bourgeois morality; and no one can say exactly how far he transgressed the bounds of law in his own life or how much of the criminal instincts of his heroes was realized in himself.' For the intimate connection between Dostoevsky's characters and his own experiences, see René Fülöp Miller's remarks in the introductory section of Fülöp-Miller and Eckstein (1925), which are based upon N. Strakhov.

We have selected three factors from Dostoevsky's complex personality, one quantitative and two qualitative: the extraordinary intensity of his emotional life, his perverse innate instinctual disposition, which inevitably marked him out to be a sado-masochist or a criminal, and his unanalysable artistic gift. This combination might very well exist without neurosis; there are people who are complete masochists without being neurotic. Nevertheless, the balance of forces between his instinctual demands and the inhibitions opposing them (plus the available methods of sublimation) would even so make it necessary to classify Dostoevsky as what is known as an 'instinctual character'. But the position is obscured by the simultaneous presence of neurosis, which, as we have said, was not in the circumstances inevitable, but which comes into being the more readily, the richer the complication which has to be mastered by the ego. For neurosis is after all only a sign that the ego has not succeeded in making a synthesis, that in attempting to do so it has forfeited its unity.

How then, strictly speaking, does his neurosis show itself? Dostoevsky called himself an epileptic, and was regarded as such by other people, on account of his severe attacks, which were accompanied by loss of consciousness, muscular convulsions and subsequent depression. Now it is highly probable that this so-called epilepsy was only a symptom of his neurosis and must accordingly be classified as hystero-epilepsy - that is, as severe hysteria. We cannot be completely certain on this point for two reasons - firstly, because the anamnestic data on Dostoevsky's alleged epilepsy are defective and untrustworthy, and secondly, because our understanding of pathological states combined with epileptiform attacks is imperfect.

To take the second point first. It is unnecessary here to reproduce the whole pathology of epilepsy, for it would throw no decisive light on the problem. But this may be said. The old *morbus sacer* is still in evidence as an ostensible clinical entity, the uncanny disease with its incalculable, apparently unprovoked convulsive attacks, its changing of the character into irritability and aggressiveness, and its progressive lowering of all the mental faculties. But the outlines of this picture are quite lacking in precision. The attacks, so savage in their onset, accompanied by biting of the tongue and incontinence of urine and working up to the dangerous *status epilepticus* with its risk of severe self-injuries, may, nevertheless, be reduced to brief periods of *absence*, or rapidly passing fits of vertigo or may be replaced by short spaces of time during which the patient does something out of character, as though he were under the control of his unconscious. These attacks, though as a rule determined, in a way we do not understand, by purely physical causes, may nevertheless owe their first appearance to some purely mental cause (a fright, for instance) or may react in other respects to mental excitations. However characteristic intellectual impairment may be in the overwhelming majority of cases, at least *one* case is known to us (that of Helmholtz) in which the affliction did not interfere with the highest intellectual achievement. (Other cases of which the same assertion has been made are either disputable or open to the same doubts as the case of Dostoevsky himself.) People who are victims of epilepsy may give an impression of dullness and arrested development just as the disease often accompanies the most palpable idiocy and the grossest cerebral defects, even though not as a necessary component of the clinical picture. But these attacks, with all their variations, also occur in other people who display complete mental development and, if anything, an excessive and as a rule insufficiently controlled emotional life. It is no wonder in these circumstances that it has been found impossible to maintain that 'epilepsy' is a single clinical entity. The similarity that we find in the manifest symptoms seems to call for a functional view of them. It is as though a mechanism for abnormal instinctual discharge had been laid down organically, which could be made use of in quite different circumstances - both in the case of disturbances of cerebral activity due to severe histolytic or toxic affections, and also in the case of inadequate control over the mental economy and at times when the activity of the energy operating in the mind reaches crisis-pitch. Behind this dichotomy we have a glimpse of the identity of the underlying mechanism of instinctual discharge. Nor can that mechanism stand remote from the sexual processes, which are fundamentally of toxic origin: the earliest physicians described coition as a minor epilepsy, and thus recognized in the sexual act a mitigation and adaptation of the epileptic method of discharging stimuli.

The 'epileptic reaction', as this common element may be called, is also undoubtedly at the disposal of the neurosis whose essence it is to get rid by somatic means of amounts of excitation which it cannot deal with psychically. Thus the epileptic attack becomes a symptom of hysteria and is adapted and modified by it just as it is by the normal sexual process of discharge. It is therefore quite right to distinguish between an organic and an 'affective' epilepsy. The practical significance of this is that a person who suffers from the first kind has a disease of the brain, while a person who suffers from the second kind is a neurotic. In the first case his mental life is subjected to an alien disturbance from without, in the second case the disturbance is an expression of his mental life itself.

It is extremely probable that Dostoevsky's epilepsy was of the second kind. This cannot, strictly speaking, be proved. To do so we should have to be in a position to insert the first appearance of the attacks and their subsequent fluctuations into the thread of his mental life; and for that we know too little. The descriptions of the attacks themselves teach us nothing and our information about the relations between them and Dostoevsky's experiences is defective and often contradictory. The most probable assumption is that the attacks went back far into his childhood, that their place was taken to begin with by milder symptoms and that they did not assume an epileptic form until after the shattering experience of his eighteenth year - the murder of his father.¹ It would be very much to the point if it could be established that they ceased completely during his exile in Siberia, but other accounts contradict this.²

¹ See René Fülöp-Miller (1924). Of especial interest is the information that in the novelist's childhood 'something terrible, unforgettable and agonizing' happened, to which the first signs of his illness were to be traced (from an article by Suvorin in the newspaper *Novoe Vremya*, 1881, quoted in the introduction to Fülöp-Miller and Eckstein, 1925, xlv). See also Orest Miller (1921, 140): 'There is, however, another special piece of evidence about Fyodor Mikhailovich's illness, which relates to his earliest youth and brings the illness into connection with a tragic event in the family life of his parents. But, although this piece of evidence was given to me orally by one who was a close friend of Fyodor Mikhailovich, I cannot bring myself to reproduce it fully and precisely since I have had no confirmation of this rumour from any other quarter.' Biographers and scientific research workers cannot feel grateful for this discretion.

² Most of the accounts, including Dostoevsky's own, assert on the contrary that the illness only assumed its final, epileptic character during the Siberian exile. Unfortunately there is reason to distrust the autobiographical statements of neurotics. Experience shows that their memories introduce falsifications which are designed to interrupt disagreeable causal connections. Nevertheless, it appears certain that Dostoevsky's detention in the Siberian prison markedly altered his pathological condition. Cf. Fülöp-Miller (1924, 1186).

The unmistakable connection between the murder of the father in *The Brothers Kamarazov* and the fate of Dostoevsky's own father has struck more than one of his biographers, and has led them to refer to 'a certain modern school of psychology'. From the standpoint of psycho-analysis (for that is what is meant), we are tempted to see in that event the severest trauma and to regard Dostoevsky's reaction to it as the turning-point of his neurosis. But if I undertake to substantiate this view psycho-analytically, I shall have to risk the danger of being unintelligible to all those readers who are unfamiliar with the language and theories of psycho-analysis.

We have one certain starting-point. We know the meaning of the first attacks from which Dostoevsky suffered in his early years, long before the incidence of the 'epilepsy'. These attacks had the significance of death: they were heralded by a fear of death and consisted of lethargic, somnolent states. The illness first came over him while he was still a boy, in the form of a sudden, groundless melancholy, a feeling, as he later told his friend Soloviev, as though he were going to die on the spot. And there in fact followed a state exactly similar to real death. His brother Andrey tells us that even when he was quite young Fyodor used to leave little notes about before he went to sleep, saying that he was afraid he might fall into this death-like sleep during the night and therefore begged that his burial should be postponed for five days. (Fülöp-Miller and Eckstein, 1925, lx.)

We know the meaning and intention of such deathlike attacks. They signify an identification with a dead person, either with someone who is really dead or with someone who is still alive and whom the subject wishes dead. The latter case is the more significant. The attack then has the value of a punishment. One has wished another person dead, and now one *is* this other person and is dead oneself. At this point psycho-analytical theory brings in the assertion that for a boy this other person is usually his father and that the attack (which is termed hysterical) is thus a self-punishment for a death-wish against a hated father.

Parricide, according to a well-known view, is the principal and primal crime of humanity as well as of the individual. (See my *Totem and Taboo* 1912-13.) It is in any case the main source of the sense of guilt, though we do not know if it is the only one: researches have not yet been able to establish with certainty the mental origin of guilt and the need for expiation. But it is not necessary for it to be the only one. The psychological situation is complicated and requires elucidation. The relation of a boy to his father is, as we say, an 'ambivalent' one. In addition to the hate which seeks to get rid of the father as a rival, a measure of tenderness for him is also habitually present. The two attitudes of mind combine to produce identification with the father; the boy wants to be in his father's place because he admires him and wants to be like him, and also because he wants to put him out of the way. This whole development now comes up against a powerful obstacle. At a certain moment the child comes to understand that an attempt to remove his father as a rival would be punished by him with castration. So from fear of castration - that is, in the interests of preserving his masculinity - he gives up his wish to possess his mother and get rid of his father. In so far as this wish remains in the unconscious it forms the basis of the sense of guilt. We believe that what we have here been describing are normal processes, the normal fate of the so-called 'Oedipus complex'; nevertheless it requires an important amplification.

A further complication arises when the constitutional factor we call bisexuality is comparatively strongly developed in a child. For then, under the threat to the boy's masculinity by castration, his inclination becomes strengthened to diverge in the direction of femininity, to put himself instead in his mother's place and take over her role as object of his father's love. But the fear of castration makes *this* solution impossible as well. The boy understands that he must also submit to castration if he wants to be loved by his father as a woman. Thus both impulses, hatred of the father and being in love with the father, undergo repression. There is a certain psychological distinction in the fact that the hatred of the father is given up on account of fear of an *external* danger (castration), while the being in love with the father is treated as an *internal* instinctual danger, though fundamentally it goes back to the same external danger.

What makes hatred of the father unacceptable is *fear* of the father; castration is terrible, whether as a punishment or as the price of love. Of the two factors which repress hatred of the father, the first, the direct fear of punishment and castration, may be called the normal one; its pathogenic intensification seems to come only with the addition of the second factor, the fear of the feminine attitude. Thus a strong innate bisexual disposition becomes one of the preconditions or reinforcements of neurosis. Such a disposition must certainly be assumed in Dostoevsky, and it shows itself in a viable form (as latent homosexuality) in the important part played by male friendships in his life, in his strangely tender attitude towards rivals in love and in his remarkable understanding of situations which are explicable only by repressed homosexuality, as many examples from his novels show.

I am sorry, though I cannot alter the facts, if this exposition of the attitudes of hatred and love towards the father and their transformations under the influence of the threat of castration seems to readers unfamiliar with psycho-analysis unsavoury and incredible. I should myself expect that it is precisely the castration complex that would be bound to arouse the most general repudiation. But I can only insist that psycho-analytic experience has put these matters in particular beyond the reach of doubt and has taught us to recognize in them the key to every neurosis. This key, then, we must apply to our author's so-called epilepsy. So alien to our consciousness are the things by which our unconscious mental life is governed!

But what has been said so far does not exhaust the consequences of the repression of the hatred of the father in the Oedipus complex. There is something fresh to be added: namely that in spite of everything the identification with the father finally makes a permanent place for itself in the ego. It is received into the ego, but establishes itself there as a separate agency in contrast to the rest of the content of the ego. We then give it the name of super-ego and ascribe to it, the inheritor of the parental influence, the most important functions. If the father was hard, violent and cruel, the super-ego takes over those attributes from him and, in the relations between the ego and it, the passivity which was supposed to have been repressed is re-established. The super-ego has become sadistic, and the ego becomes masochistic - that is to say, at bottom passive in a feminine way. A great need for punishment develops in the ego, which in part offers itself as a victim to Fate, and in part finds satisfaction in ill-treatment by the super-ego (that is, in the sense of guilt). For every punishment is ultimately castration and, as such, a fulfilment of the old passive attitude towards the father. Even Fate is, in the last resort, only a later projection of the father.

The normal processes in the formation of conscience must be similar to the abnormal ones described here. We have not yet succeeded in fixing the boundary line between them. It will be observed that here the largest share in the outcome is ascribed to the passive component of repressed femininity. In addition, it must be of importance as an accidental factor whether the father, who is feared in any case, is also especially violent in reality. This was true in Dostoevsky's case, and we can trace back the fact of his extraordinary sense of guilt and of his masochistic conduct of life to a specially strong feminine component. Thus the formula for Dostoevsky is as follows: a person with a specially strong innate bisexual disposition, who can defend himself with special intensity against dependence on a specially severe father. This characteristic of bisexuality comes as an addition to the components of his nature that we have already recognized. His early symptoms of death-like attacks can thus be understood as a father-identification on the part of his ego, which is permitted by his super-ego as a punishment. 'You wanted to kill your father in order to be your father yourself. Now you *are* your father, but a dead father' - the regular mechanism of hysterical symptoms. And further: 'Now your father is killing *you*.' For the ego the death symptom is a satisfaction in phantasy of the masculine wish and at the same time a masochistic satisfaction; for the super-ego it is a punitive satisfaction - that is, a sadistic satisfaction. Both of them, the ego and the super-ego, carry on the role of father.

To sum up, the relation between the subject and his father-object, while retaining its content, has been transformed into a relation between the ego and the super-ego - a new setting on a fresh stage. Infantile reactions from the Oedipus complex such as these may disappear if reality gives them no further nourishment. But the father's character remained the same, or rather, it deteriorated with the years, and thus Dostoevsky's hatred for his father and his death-wish against that wicked father were maintained. Now it is a dangerous thing if reality fulfils such repressed wishes. The phantasy has become reality and all defensive measures are thereupon reinforced. Dostoevsky's attacks now assumed an epileptic character; they still undoubtedly signified an identification with his father as a punishment, but they had become terrible, like his father's frightful death itself. What further content they had absorbed, particularly what sexual content, escapes conjecture.

One thing is remarkable: in the aura of the epileptic attack, one moment of supreme bliss is experienced. This may very well be a record of the triumph and sense of liberation felt on hearing the news of the death, to be followed immediately by an all the more cruel punishment. We have divined just such a sequence of triumph and mourning, of festive joy and mourning, in the brothers of the primal horde who murdered their father, and we find it repeated in the ceremony of the totem meal.¹ If it proved to be the case that Dostoevsky was free from his attacks in Siberia, that would merely substantiate the view that they were his punishment. He did not need them any longer when he was being punished in another way. But that cannot be proved. Rather does this necessity for punishment on the part of Dostoevsky's mental economy explain the fact that he passed unbroken through these years of misery and humiliation. Dostoevsky's condemnation as a political prisoner was unjust and he must have known it, but he accepted the undeserved punishment at the hands of the Little Father, the Tsar, as a substitute for the punishment he deserved for his sin against his real father. Instead of punishing himself, he got himself punished by his father's deputy. Here we have a glimpse of the psychological justification of the punishments inflicted by society. It is a fact that large groups of criminals want to be punished. Their super-ego demands it and so saves itself the necessity for inflicting the punishment itself.

¹ See *Totem and Taboo*.

Everyone who is familiar with the complicated transformation of meaning undergone by hysterical symptoms will understand that no attempt can be made here to follow out the meaning of Dostoevsky's attacks beyond this beginning.¹ It is enough that we may assume that their original meaning remained unchanged behind all later accretions. We can safely say that Dostoevsky never got free from the feelings of guilt arising from his intention of murdering his father. They also determined his attitude in the two other spheres in which the father-relation is the decisive factor, his attitude towards the authority of the State and towards belief in God. In the first of these he ended up with complete submission to his Little Father, the Tsar, who had once performed with him in *reality* the comedy of killing which his attacks had so often represented in *play*. Here penitence gained the upper hand. In the religious sphere he retained more freedom: according to apparently trustworthy reports he wavered, up to the last moment of his life, between faith and atheism. His great intellect made it impossible for him to overlook any of the intellectual difficulties to which faith leads. By an individual recapitulation of a development in world-history he hoped to find a way out and a liberation from guilt in the Christ ideal, and even to make use of his sufferings as a claim to be playing a Christ-like role. If on the whole he did not achieve freedom and became a reactionary, that was because the filial guilt, which is present in human beings generally and on which religious feeling is built, had in him attained a super-individual intensity and remained insurmountable even to his great intelligence. In writing this we are laying ourselves open to the charge of having abandoned the impartiality of analysis and of subjecting Dostoevsky to judgements that can only be justified from the partisan standpoint of a particular *Weltanschauung*. A conservative would take the side of the Grand Inquisitor and would judge Dostoevsky differently. The objection is just; and one can only say in extenuation that Dostoevsky's decision has every appearance of having been determined by an intellectual inhibition due to his neurosis.

¹ The best account of the meaning and content given by Dostoevsky himself, when he told his friend Strakhov that his irritability and depression after an epileptic attack were due to the fact that he seemed to himself a criminal and could not get rid of the feeling that he had a burden of unknown guilt upon him, that he had committed some great misdeed, which oppressed him. (Fülöp-Miller, 1924, 1188.) In self-accusations like these psycho-analysis sees signs of a recognition of 'psychical reality', and it endeavours to make the unknown guilt known to consciousness.

It can scarcely be owing to chance that three of the masterpieces of the literature of all time - the *Oedipus Rex* of Sophocles, Shakespeare's *Hamlet* and Dostoevsky's *The Brothers Kamarazov* - should all deal with the same subject, parricide. In all three, moreover, the motive for the deed, sexual rivalry for a woman, is laid bare.

The most straightforward is certainly the representation in the drama derived from the Greek legend. In this it is still the hero himself who commits the crime. But poetic treatment is impossible without softening and disguise. The naked admission of an intention to commit parricide, as we arrive at it in analysis, seems intolerable without analytic preparation. The Greek drama, while retaining the crime, introduces the indispensable toning-down in a masterly fashion by projecting the hero's unconscious motive into reality in the form of a compulsion by a destiny which is alien to him. The hero commits the deed unintentionally and apparently uninfluenced by the woman; this latter element is however taken into account in the circumstance that the hero can only obtain possession of the queen mother after he has repeated his deed upon the monster who symbolizes the father. After his guilt has been revealed and made conscious, the hero makes no attempt to exculpate himself by appealing to the artificial expedient of the compulsion of destiny. His crime is acknowledged and punished as though it were a full and conscious one - which is bound to appear unjust to our reason, but which psychologically is perfectly correct.

In the English play the presentation is more indirect; the hero does not commit the crime himself; it is carried out by someone else, for whom it is not parricide. The forbidden motive of sexual rivalry for the woman does not need, therefore, to be disguised. Moreover, we see the hero's Oedipus complex, as it were, in a reflected light, by learning the effect upon him of the other's crime. He ought to avenge the crime, but finds himself, strangely enough, incapable of doing so. We know that it is his sense of guilt that is paralysing him; but, in a manner entirely in keeping with neurotic processes, the sense of guilt is displaced on to the perception of his inadequacy for fulfilling his task. There are signs that the hero feels this guilt as a super-individual one. He despises others no less than himself: 'Use every man after his desert, and who should 'scape whipping?'

The Russian novel goes a step further in the same direction. There also the murder is committed by someone else. This other person, however, stands to the murdered man in the same filial relation as the hero, Dmitri; in this other person's case the motive of sexual rivalry is openly admitted; he is a brother of the hero's, and it is a remarkable fact that Dostoevsky has attributed to him his own illness, the alleged epilepsy, as though he were seeking to confess that the epileptic, the neurotic, in himself was a parricide. Then, again, in the speech for the defence at the trial, there is the famous mockery of psychology - it is a 'knife that cuts both ways': a splendid piece of disguise, for we have only to reverse it in order to discover the deepest meaning of Dostoevsky's view of things. It is not psychology that deserves the mockery, but the procedure of judicial enquiry. It is a matter of indifference who actually committed the crime; psychology is only concerned to know who desired it emotionally and who welcomed it when it was done. And for that reason all of the brothers, except the contrasted figure of Alyosha, are equally guilty - the impulsive sensualist, the sceptical cynic and the epileptic criminal. In *The Brothers Karamazov* there is one particularly revealing scene. In the course of his talk with Dmitri, Father Zossima recognizes that Dmitri is prepared to commit parricide, and he bows down at his feet. It is impossible that this can be meant as an expression of admiration; it must mean that the holy man is rejecting the temptation to despise or detest the murderer and for that reason humbles himself before him. Dostoevsky's sympathy for the criminal is, in fact, boundless; it goes far beyond the pity which the unhappy wretch has a right to, and reminds us of the 'holy awe' with which epileptics and lunatics were regarded in the past. A criminal is to him almost a Redeemer, who has taken on himself the guilt which must else have been borne by others. There is no longer any need for one to murder, since *he* has already murdered; and one must be grateful to him, for, except for him, one would have been obliged oneself to murder. That is not kindly pity alone, it is identification on the basis of similar murderous impulses - in fact, a slightly displaced narcissism. (In saying this, we are not disputing the ethical value of this kindliness.) This may perhaps be quite generally the mechanism of kindly sympathy with other people, a mechanism which one can discern with especial ease in this extreme case of a guilt-ridden novelist. There is no doubt that this sympathy by identification was a decisive factor in determining Dostoevsky's choice of material. He dealt first with the common criminal (whose motives are egotistical) and the political and religious criminal; and not until the end of his life did he come back to the primal criminal, the parricide, and use him, in a work of art, for making his confession.

The publication of Dostoevsky's posthumous papers and of his wife's diaries has thrown a glaring light on one episode in his life, namely the period in Germany when he was obsessed with a mania for gambling (cf. Fülöp-Miller and Eckstein, 1925), which no one could regard as anything but an unmistakable fit of pathological passion. There was no lack of rationalizations for this remarkable and unworthy behaviour. As often happens with neurotics, Dostoevsky's sense of guilt had taken a tangible shape as a burden of debt, and he was able to take refuge behind the pretext that he was trying by his winnings at the tables to make it possible for him to return to Russia without being arrested by his creditors. But this was no more than a pretext and Dostoevsky was acute enough to recognize the fact and honest enough to admit it. He knew that the chief thing was gambling for its own sake - *le jeu pour le jeu*.¹ All the details of his impulsively irrational conduct show this and something more besides. He never rested until he had lost everything. For him gambling was a method of self-punishment as well. Time after time he gave his young wife his promise or his word of honour not to play any more or not to play any more on that particular day; and, as she says, he almost always broke it. When his losses had reduced himself and her to the direst need, he derived a second pathological satisfaction from that. He could then scold and humiliate himself before her, invite her to despise him and to feel sorry that she had married such an old sinner; and when he had thus unburdened his conscience, the whole business would begin again next day. His young wife accustomed herself to this cycle, for she had noticed that the one thing which offered any real hope of salvation - his literary production - never went better than when they had lost everything and pawned their last possessions. Naturally she did not understand the connection. When his sense of guilt was satisfied by the punishments he had inflicted on himself, the inhibition upon his work became less severe and he allowed himself to take a few steps along the road to success.²

¹ 'The main thing is the play itself,' he writes in one of his letters. 'I swear that greed for money has nothing to do with it, although Heaven knows I am sorely in need of money.'

² 'He always remained at the gaming tables till he had lost everything and was totally ruined. It was only when the damage was quite complete that the demon at last retired from his soul and made way for the creative genius.' (Fülöp-Miller and Eckstein, 1925, lxxxvi.)

What part of a gambler's long-buried childhood is it that forces its way to repetition in his obsession for play? The answer may be divined without difficulty from a story by one of our younger writers. Stefan Zweig, who has incidentally devoted a study to Dostoevsky himself (1920), has included in his collection of three stories *Die Verwirrung der Gefühle* (1927) one which he calls 'Vierundzwanzig Stunden aus dem Leben einer Frau'. This little masterpiece ostensibly sets out only to show what an irresponsible creature woman is, and to what excesses, surprising even to herself, an unexpected experience may drive her. But the story tells far more than this. If it is subjected to an analytical interpretation, it will be found to represent (without any apologetic intent) something quite different, something universally human, or rather something masculine. And such an interpretation is so extremely obvious that it cannot be resisted. It is characteristic of the nature of artistic creation that the author, who is a personal friend of mine, was able to assure me, when I asked him, that the interpretation which I put to him had been completely strange to his knowledge and intention, although some of the details woven into the narrative seemed expressly designed to give a clue to the hidden secret.

In this story, an elderly lady of distinction tells the author about an experience she has had more than twenty years earlier. She has been left a widow when still young and is the mother of two sons, who no longer need her. In her forty-second year, expecting nothing further of life, she happens, on one of her aimless journeyings, to visit the Rooms at Monte Carlo. There, among all the remarkable impressions which the place produces, she is soon fascinated by the sight of a pair of hands which seem to betray all the feelings of the unlucky gambler with terrifying sincerity and intensity. These hands belong to a handsome young man - the author, as though unintentionally, makes him of the same age as the narrator's elder son - who, after losing everything, leaves the Rooms in the depth of despair, with the evident intention of ending his hopeless life in the Casino gardens. An inexplicable feeling of sympathy compels her to follow him and make every effort to save him. He takes her for one of the importunate women so common there and tries to shake her off; but she stays with him and finds herself obliged, in the most natural way possible, to join him in his apartment at the hotel, and finally to share his bed. After this improvised light of love, she exacts a most solemn vow from the young man, who has now apparently calmed down, that he will never play again, provides him with money for his journey home and promises to meet him at the station before the departure of his train. Now, however, she begins to feel a great tenderness for him, is ready to sacrifice all she has in order to keep him and makes up her mind to go with him instead of saying goodbye. Various mischances delay her, so that she misses the train. In her longing for the lost one she returns once more to the Rooms and there, to her horror, sees once more the hands which had first excited her sympathy: the faithless youth had gone back to his play. She reminds him of his promise, but, obsessed by his passion, he calls her a spoil-sport, tells her to go, and flings back the money with which she has tried to rescue him. She hurries away in deep mortification and learns later that she has not succeeded in saving him from suicide.

The brilliantly told, faultlessly motivated story is of course complete in itself and is certain to make a deep effect upon the reader. But analysis shows us that its invention is based fundamentally upon a wishful phantasy belonging to the period of puberty, which a number of people actually remember consciously. The phantasy embodies a boy's wish that his mother should herself initiate him into sexual life in order to save him from the dreaded injuries caused by masturbation. (The numerous creative works that deal with the theme of redemption have the same origin.) The 'vice' of masturbation is replaced by the addiction to gambling; and the emphasis laid upon the passionate activity of the hands betrays this derivation. Indeed, the passion for play is an equivalent of the old compulsion to masturbate; 'playing' is the actual word used in the nursery to describe the activity of the hands upon the genitals. The irresistible nature of the temptation, the solemn resolutions, which are nevertheless invariably broken, never to do it again, the stupefying pleasure and the bad conscience which tells the subject that he is ruining himself (committing suicide) - all these elements remain unaltered in the process of substitution. It is true that Zweig's story is told by the mother, not by the son. It must flatter the son to think: 'if my mother only knew what dangers masturbation involves me in, she would certainly save me from them by allowing me to lavish all my tenderness on her own body'. The equation of the mother with a prostitute, which is made by the young man in the story, is linked up with the same phantasy. It brings the unattainable woman within easy reach. The bad conscience which accompanies the phantasy brings about the unhappy ending of the story. It is also interesting to notice how the *façade* given to the story by its author seeks to disguise its analytic meaning. For it is extremely questionable whether the erotic life of women is dominated by sudden and mysterious impulses. On the contrary, analysis reveals an adequate motivation for the surprising behaviour of this woman who had hitherto turned away from love. Faithful to the memory of her dead husband, she had armed herself against all similar attractions; but - and here the son's phantasy is right - she did not, as a mother, escape her quite unconscious transference of love on to her son, and Fate was able to catch her at this undefended spot.

If the addiction to gambling, with the unsuccessful struggles to break the habit and the opportunities it affords for self-punishment, is a repetition of the compulsion to masturbate, we shall not be surprised to find that it occupied such a large space in Dostoevsky's life. After all, we find no cases of severe neurosis in which the auto-erotic satisfaction of early childhood and of puberty has not played a part; and the relation between efforts to suppress it and fear of the father are too well known to need more than a mention.¹

¹ Most of the views which are here expressed are also contained in an excellent book by Jolan Neufeld (1923)

APPENDIX

A LETTER FROM FREUD TO THEODOR REIK

April 14, 1929

. . . I have read your critical review of my Dostoevsky study with great pleasure. All your objections deserve consideration and must be recognized as in a sense apt. I can bring forward a little in my defence. But of course it will not be a question of who is right or who is wrong.

I think you are applying too high a standard to this triviality. It was written as a favour to someone and written reluctantly. I always write reluctantly nowadays. No doubt you noticed this about it. This is not meant, of course, to excuse hasty or false judgements, but merely the careless architecture of the essay as a whole. I cannot dispute the unharmonious effect produced by the addition of the Zweig analysis; but deeper examination will perhaps show some justification for it. If I had not been hampered by considerations of the place where my essay was to appear, I should certainly have written: 'We may expect that in the history of a neurosis accompanied by such a severe sense of guilt a special part will be played by the struggle against masturbation. This expectation is completely fulfilled by Dostoevsky's pathological addiction to gambling. For, as we can see from a short story of Zweig's . . . etc.' That is to say, the amount of space given to the short story corresponds not to the relation: Zweig-Dostoevsky, but to the other one: masturbation-neurosis. All the same, the outcome was clumsy.

I hold firmly to a scientifically objective social assessment of ethics, and for that reason I should not wish to deny the excellent Philistine a certificate of good ethical conduct, even though it has cost him little self-discipline. But alongside of this I grant the validity of the subjective psychological view of ethics which you support. Though I agree with your judgement of the world and mankind as they are to-day, I cannot, as you know, regard your pessimistic dismissal of a better future as justified.

As you suggest, I included Dostoevsky the psychologist under the creative artist. Another objection I might have raised against him was that his insight was so much restricted to abnormal mental life. Consider his astonishing helplessness in face of the phenomena of love. All he really knew were crude, instinctual desire, masochistic subjection and loving out of pity. You are right, too, in suspecting that, in spite of all my admiration for Dostoevsky's intensity and pre-eminence, I do not really like him. That is because my patience with pathological natures is exhausted in analysis. In art and life I am intolerant of them. Those are character traits personal to me and not binding on others.

Where are you going to publish your essay? I rate it very highly. It is only scientific research that must be without presumptions. In every other kind of thinking the choice of a point of view cannot be avoided; and there are, of course, several of these . . .

SOME DREAMS OF DESCARTES'
A LETTER TO MAXIME LEROY
(1929)

Intentionally left blank

SOME DREAMS OF DESCARTES' A LETTER TO MAXIME LEROY

On considering your letter asking me to examine some dreams of Descartes', my first feeling was an impression of dismay, since working on dreams without being able to obtain from the dreamer himself any indications on the relations which might link them to one another or attach them to the external world - and this is clearly the case when it is a question of the dreams of a historical figure - gives, as a general rule, only a meagre result. In the event my task turned out to be easier than I had anticipated; nevertheless, the fruit of my investigations will no doubt seem to you much less important than you had a right to expect.

Our philosopher's dreams are what are known as 'dreams from above' (*'Träume von oben'*). That is to say, they are formulations of ideas which could have been created just as well in a waking state as during the state of sleep, and which have derived their content only in certain parts from mental states at a comparatively deep level. That is why these dreams offer for the most part a content which has an abstract, poetic or symbolic form.

The analysis of dreams of this kind usually leads us to the following position: we cannot understand the dream, but the dreamer - or the patient - can translate it immediately and without difficulty, given that the content of the dream is very close to his conscious thoughts. There then remain certain parts of the dream about which the dreamer does not know what to say: and these are precisely the parts which belong to the unconscious and which are in many respects the most interesting.

In the most favourable cases we explain this unconscious with the help of the ideas which the dreamer has added to it.

This way of judging 'dreams from above' - and this term must be understood in a psychological, not in a mystical, sense - is the one to be followed in the case of Descartes' dreams.

The philosopher interprets them himself and, in accordance with all the rules for the interpretation of dreams, we must accept his explanation, but it should be added that we have no path open to us which will take us any further.

In confirmation of his explanation we can say that the hindrances which prevented him from moving freely are perfectly well known to us: they are a representation by the dream of an internal conflict. The left side represents evil and sin, and the wind the 'evil genius' (*animus*).

The different figures who appear in the dream cannot of course be identified by us, although Descartes, if he were questioned, would not have failed to identify them. The bizarre elements, of which, incidentally, there are few, and which are almost absurd - such as 'the melon from a foreign land', and the little portraits - remain unexplained.

As regards the melon, the dreamer has had the - original - idea of seeing in it 'the charms of solitude, but presented by purely human inducements'. This is certainly not correct, but it might provide an association of ideas which would lead to a correct explanation. If it is correlated with his state of sin, this association might stand for a sexual picture which occupied the lonely young man's imagination.

On the question of the portraits Descartes throws no light.

THE GOETHE PRIZE
(1930)

Intentionally left blank

4576

LETTER TO DR. ALFONS PAQUET

Grundlsee, 3.8.1930

My dear Dr. Paquet,

I have not been spoilt by public marks of honour and I have so adapted myself to this state of things that I have been able to do without them. I should not like to deny, however, that the award of the Goethe Prize of the City of Frankfurt has given me great pleasure. There is something about it that especially fires the imagination and one of its stipulations dispels the feeling of humiliation which in other cases is a concomitant of such distinctions.

I must particularly thank you for your letter; it moved and astonished me. Apart from your sympathetic penetration into the nature of my work, I have never before found the secret, personal intentions behind it recognized with such clarity as by you, and I should very much like to ask you how you come by such knowledge.

I am sorry to learn from your letter to my daughter that I am not to see you in the near future, and postponement is always a chancy affair at my time of life. Of course I shall be most ready to receive the gentleman (Dr. Michel) whose visit you announce.

Unfortunately I shall not be able to attend the ceremony in Frankfurt; I am too frail for such an undertaking. The company there will lose nothing by that: my daughter Anna is certainly pleasanter to look at and to listen to than I am. We propose that she shall read out a few sentences of mine which deal with Goethe's connections with psycho-analysis and defend the analysts themselves against the reproach of having offended against the respect due to the great man by the analytic attempts they have made on him. I hope it will be acceptable if I thus adapt the theme that has been proposed to me - my 'inner relations as a man and a scientist to Goethe' - or else that you will be kind enough to let me know.

Yours very sincerely,
Freud

ADDRESS DELIVERED IN THE GOETHE HOUSE AT FRANKFURT

My life's work has been directed to a single aim. I have observed the more subtle disturbances of mental function in healthy and sick people and have sought to infer - or, if you prefer it, to guess - from signs of this kind how the apparatus which serves these functions is constructed and what concurrent and mutually opposing forces are at work in it. What we - I, my friends and collaborators - have managed to learn in following this path has seemed to us of importance for the construction of a mental science which makes it possible to understand both normal and pathological processes as parts of the same natural course of events.

I was recalled from such narrow considerations by the astonishing honour which you do me. By evoking the figure of the great universal personality who was born in this house and who spent his childhood in these rooms, your distinction prompts one as it were to justify oneself before him and raises the question of how *he* would have reacted if his glance, attentive to every innovation in science, had fallen on psycho-analysis. Goethe can be compared in versatility to Leonardo da Vinci, the Renaissance master, who like him was both artist and scientific investigator. But human images can never be repeated, and profound differences between the two great men are not lacking. In Leonardo's nature the scientist did not harmonize with the artist, he interfered with him and perhaps in the end stifled him. In Goethe's life both personalities found room side by side: at different times each allowed the other to predominate. In Leonardo it is plausible to associate his disturbance with that inhibition in his development which withdrew everything erotic, and hence psychology too, from his sphere of interest. In this respect Goethe's character was able to develop more freely.

I think that Goethe would not have rejected psycho-analysis in an unfriendly spirit, as so many of our contemporaries have done. He himself approached it at a number of points, recognized much through his own insight that we have since been able to confirm, and some views, which have brought criticism and mockery down upon us, were expounded by him as self-evident. Thus he was familiar with the incomparable strength of the first affective ties of human creatures. He celebrated them in the Dedication to his *Faust* poem, in words which we could repeat for each of our analyses:

Ihr naht euch wieder, schwankende Gestalten,
Die früh sich einst dem trüben Blick gezeigt,
Versuch' ich wohl, euch diesmal festzuhalten?

.
Gleich einer alten, halbverklungenen Sage
Kommt erste Lieb' und Freundschaft mit herauf

He explained to himself the strongest impulse of love that he experienced as a mature man by apostrophizing his beloved: 'Ach, du warst in abgelebten Zeiten meine Schwester oder meine Frau.'

Thus he does not deny that these perennial first inclinations take figures from one's own family circle as their object.

Goethe paraphrases the content of dream-life in the evocative words:

Was von Menschen nicht gewusst
Oder nicht bedacht,
Durch das Labyrinth der Brust
Wandelt in der Nacht.

Behind this magic we recognize the ancient, venerable and incontestably correct pronouncement of Aristotle - that dreaming is the continuation of our mental activity into the state of sleep - combined with the recognition of the unconscious which psycho-analysis first added to it. Only the riddle of dream-distortion finds no solution here.

In what is perhaps his most sublime poetical creation, *Iphigenie*, Goethe shows us a striking instance of expiation, of the freeing of a suffering mind from the burden of guilt, and he makes this catharsis come about through a passionate outburst of feeling under the beneficent influence of loving sympathy. Indeed, he himself repeatedly made attempts at giving psychological help - as for example to the unfortunate man who is named as Kraft in the Letters, and to Professor Plessing, of whom he tells in the *Campagne in Frankreich*; and the procedure which he applied goes beyond the method of the Catholic Confessional and approximates in some remarkable details to the technique of our psycho-analysis. There is an example of psychotherapeutic influence which is described by Goethe as a jest, but which I should like to quote in full since it may not be well known and yet is very characteristic. It is from a letter to Frau von Stein (No. 1444, of September 5, 1785):

'Yesterday evening I performed a psychological feat. Frau Herder was still in a state of tension of the most hypochondriacal kind over all the unpleasant things that had happened to her at Carlsbad. Particularly through the woman who was her companion in the house. I made her tell and confess everything to me, other people's misdeeds and her own faults with their most minute circumstances and consequences, and at the end I absolved her and made it clear to her, jestingly, in this formula, that these things were now done with and cast into the depths of the sea. She herself made fun of it all and is really cured.'

Goethe always rated Eros high, never tried to belittle its power, followed its primitive and even wanton expressions with no less attentiveness than its highly sublimated ones and has, as it seems to me, expounded its essential unity throughout all its manifestations no less decisively than Plato did in the remote past. Indeed, it is perhaps more than a chance coincidence when in *Die Wahlverwandtschaften* he applies to love an idea taken from the sphere of chemistry - a connection to which the name of psycho-analysis itself bears witness.

I am prepared for the reproach that we analysts have forfeited the right to place ourselves under the patronage of Goethe because we have offended against the respect due to him by trying to apply analysis to him himself: we have degraded the great man to the position of an object of analytic investigation. But I would dispute at once that any degradation is intended or implied by this.

We all, who revere Goethe, put up, without too much protest, with the efforts of his biographers, who try to recreate his life from existing accounts and indications. But what can these biographies achieve for us? Even the best and fullest of them could not answer the two questions which alone seem worth knowing about. It would not throw any light on the riddle of the miraculous gift that makes an artist, and it could not help us to comprehend any better the value and the effect of his works. And yet there is no doubt that such a biography does satisfy a powerful need in us. We feel this very distinctly if the legacy of history unkindly refuses the satisfaction of this need - for example in the case of Shakespeare. It is undeniably painful to all of us that even now we do not know who was the author of the Comedies, Tragedies and Sonnets of Shakespeare; whether it was in fact the untutored son of the provincial citizen of Stratford, who attained a modest position as an actor in London, or whether it was, rather, the nobly-born and highly cultivated, passionately wayward, to some extent *déclassé* aristocrat, Edward de Vere, Seventeenth Earl of Oxford, hereditary Lord Great Chamberlain of England. But how can we justify a need of this kind to obtain knowledge of the circumstances of a man's life when his works have become so full of importance to us? People generally say that it is our desire to bring ourselves nearer to such a man in a human way as well. Let us grant this; it is, then, the need to acquire affective relations with such men, to add them to the fathers, teachers, exemplars whom we have known or whose influence we have already experienced, in the expectation that their personalities will be just as fine and admirable as those works of art of theirs which we possess.

All the same, we may admit that there is still another motive force at work. The biographer's justification also contains a confession. It is true that the biographer does not want to depose his hero, but he does want to bring him nearer to us. That means, however, reducing the distance that separates him from us: it still tends in effect towards degradation. And it is unavoidable that if we learn more about a great man's life we shall also hear of occasions on which he has in fact done no better than we, has in fact come near to us as a human being. Nevertheless, I think we may declare the efforts of biography to be legitimate. Our attitude to fathers and teachers is, after all, an ambivalent one since our reverence for them regularly conceals a component of hostile rebellion. That is a psychological fatality; it cannot be altered without forcible suppression of the truth and is bound to extend to our relations with the great men whose life histories we wish to investigate.

When psycho-analysis puts itself at the service of biography, it naturally has the right to be treated no more harshly than the latter itself. Psycho-analysis can supply some information which cannot be arrived at by other means, and can thus demonstrate new connecting threads in the 'weaver's masterpiece' spread between the instinctual endowments, the experiences and the works of an artist. Since it is one of the principal functions of our thinking to master the material of the external world psychically, it seems to me that thanks are due to psycho-analysis if, when it is applied to a great man, it contributes to the understanding of his great achievement. But, I admit, in the case of Goethe we have not yet succeeded very far. This is because Goethe was not only, as a poet, a great self-revealer, but also, in spite of the abundance of autobiographical records, a careful concealer. We cannot help thinking here of the words of Mephistopheles:

Das Beste, was du wissen kannst,
Darfst du den Buben doch nicht sagen.

LIBIDINAL TYPES
(1931)

4584

LIBIDINAL TYPES

Observation teaches us that individual human beings realize the general picture of humanity in an almost infinite variety of ways. If we yield to the legitimate need to distinguish particular types in this multiplicity, we shall at the start have the choice as to what characteristics and what points of view we shall take as the basis of our differentiation. For that purpose physical qualities will doubtless serve no less well than mental ones; the most valuable distinctions will be those which promise to present a regular combination of physical and mental characteristics.

It is doubtful whether we are as yet in a position to discover types to fulfil this requirement - as we shall no doubt be able to do later, on some basis of which we are still ignorant. If we confine our effort to setting up purely psychological types, the libidinal situation will have a first claim to serve as a basis for our classification. It may fairly be demanded that this classification should not merely be deduced from our knowledge or our hypotheses about the libido, but that it should be easily confirmed in actual experience and that it should contribute to the clarification of the mass of our observations and help us to grasp them. It may at once be admitted that these libidinal types need not be the only possible ones even in the psychical field, and that, if we proceeded from other qualities, we might perhaps establish a whole set of other psychological types. But it must be required of all such types that they shall not coincide with clinical pictures. On the contrary, they must comprehend all the variations which according to our practical judgement fall within the limits of the normal. In their extreme developments, however, they may well approximate to clinical pictures and in that way help to bridge the gulf that is supposed to lie between the normal and the pathological.

According, then, as the libido is predominantly allocated to the provinces of the mental apparatus, we can distinguish three main libidinal types. To give names to these types is not particularly easy; following the lines of our depth-psychology, I should like to call them the *erotic*, the *narcissistic* and the *obsessional* types.

The *erotic* type is easily characterized. Erotics are those whose main interest - the relatively largest part of whose libido - is turned towards love. Loving, but above all being loved, is the most important thing for them. They are dominated by the fear of loss of love and are therefore especially dependent on others who may withhold their love from them. Even in its pure form this type is a very common one. Variants of it occur according as it is blended with another type and in proportion to the amount of aggressiveness present in it. From the social and cultural standpoint this type represents the elementary instinctual demands of the id, to which the other psychical agencies have become compliant.

The second type is what I have termed the *obsessional* type - a name which may at first seem strange. It is distinguished by the predominance of the super-ego, which is separated from the ego under great tension. People of this type are dominated by fear of their conscience instead of fear of losing love. They exhibit, as it were, an internal instead of an external dependence. They develop a high degree of self-reliance; and, from the social standpoint, they are the true, pre-eminently conservative vehicles of civilization.

The third type, justly called the *narcissistic* type, is mainly to be described in negative terms. There is no tension between ego and super-ego (indeed, on the strength of this type one would scarcely have arrived at the hypothesis of a super-ego), and there is no preponderance of erotic needs. The subject's main interest is directed to self-preservation; he is independent and not open to intimidation. His ego has a large amount of aggressiveness at its disposal, which also manifests itself in readiness for activity. In his erotic life loving is preferred above being loved. People belonging to this type impress others as being 'personalities'; they are especially suited to act as a support for others, to take on the role of leaders and to give a fresh stimulus to cultural development or to damage the established state of affairs.

These pure types will hardly escape the suspicion of having been deduced from the theory of the libido. But we feel ourselves on the firm ground of experience when we turn to the mixed types, which are to be observed so much more frequently than the unmixed ones. These new types - the *erotic-obsessional*, the *erotic-narcissistic* and the *narcissistic-obsessional* - seem in fact to afford a good classification of the individual psychical structures which we have come to know through analysis. If we study these mixed types we find in them pictures of characters with which we have long been familiar. In the *erotic-obsessional* type it appears that the preponderance of instinctual life is restricted by the influence of the super-ego. In this type, dependence at once on contemporary human objects and on the residues of parents, educators and exemplars, is carried to its highest pitch. The *erotic-narcissistic* type is perhaps the one we must regard as the commonest of all. It unites opposites, which are able to moderate one another in it. One may learn from this type, as compared with the two other erotic ones, that aggressiveness and activity go along with a predominance of narcissism. Finally, the *narcissistic-obsessional* type produces the variation which is most valuable from a cultural standpoint; for it adds to independence of the external world and a regard for the demands of conscience a capacity for vigorous action, and it strengthens the ego against the super-ego.

One might think one was making a jest if one asked why no mention has been made here of another mixed type which is theoretically possible - namely, the *erotic-obsessional-narcissistic* type. But the answer to this jest is serious. Such a type would no longer be a type at all: it would be the absolute norm, the ideal harmony. We thus realize that the phenomenon of types arises precisely from the fact that, of the three main ways of employing the libido in the economy of the mind, one or two have been favoured at the expense of the others.

The question may also be raised of what the relation is of these libidinal types to pathology - whether some of them have a special disposition to pass over into neurosis, and if so, which types lead to which forms of neurosis. The answer is that the setting-up of these libidinal types throws no new light on the genesis of the neuroses. Experience shows that all these types can exist without any neurosis. The pure types, marked by the undisputed preponderance of a single mental agency, seem to have a better chance of manifesting themselves as pure characterological pictures, while we might expect that mixed types would provide a more favourable soil for conditions leading to a neurosis. But I think we should not make up our minds on these matters till they have been submitted to a careful and specially directed examination.

It seems easy to infer that when people of the erotic type fall ill they will develop hysteria, just as those of the obsessional the will develop obsessional neurosis; but these inferences, too, share the uncertainty which I have just stressed. People of the narcissistic type who are exposed to a frustration from the external world, though otherwise independent, are peculiarly disposed to psychosis; and they also present essential preconditions for criminality.

It is a familiar fact that the aetiological preconditions of neurosis are not yet known with certainty. The precipitating causes of it are frustrations and internal conflicts: conflicts between the three major psychical agencies, conflicts arising within the libidinal economy in consequence of our bisexual disposition and conflicts between the erotic and the aggressive instinctual components. It is the endeavour of the psychology of the neuroses to discover what makes these processes, which belong to the normal course of mental life, become pathogenic.

FEMALE SEXUALITY
(1931)

Intentionally left blank

FEMALE SEXUALITY

I

During the phase of the normal Oedipus complex we find the child tenderly attached to the parent of the opposite sex, while its relation to the parent of its own sex is predominantly hostile. In the case of a boy there is no difficulty in explaining this. His first love-object was his mother. She remains so; and, with the strengthening of his erotic desires and his deeper insight into the relations between his father and mother, the former is bound to become his rival. With the small girl it is different. Her first object, too, was her mother. How does she find her way to her father? How, when and why does she detach herself from her mother? We have long understood that the development of female sexuality is complicated by the fact that the girl has the task of giving up what was originally her leading genital zone the clitoris - in favour of a new zone - the vagina. But it now seems to us that there is a second change of the same sort which is no less characteristic and important for the development of the female: the exchange of her original object - her mother - for her father. The way in which the two tasks are connected with each other is not yet clear to us.

It is well known that there are many women who have a strong attachment to their father; nor need they be in any way neurotic. It is upon such women that I have made the observations which I propose to report here and which have led me to adopt a particular view of female sexuality. I was struck, above all, by two facts. The first was that where the woman's attachment to her father was particularly intense, analysis showed that it had been preceded by a phase of exclusive attachment to her mother which had been equally intense and passionate. Except for the change of her love-object, the second phase had scarcely added any new feature to her erotic life. Her primary relation to her mother had been built up in a very rich and many-sided manner. The second fact taught me that the *duration* of this attachment had also been greatly under-estimated. In several cases it lasted until well into the fourth year - in one case into the fifth year - so that it covered by far the longer part of the period of early sexual efflorescence. Indeed, we had to reckon with the possibility that a number of women remain arrested in their original attachment to their mother and never achieve a true change-over towards men. This being so, the pre-Oedipus phase in women gains an importance which we have not attributed to it hitherto.

Since this phase allows room for all the fixations and repressions from which we trace the origin of the neuroses, it would seem as though we must retract the universality of the thesis that the Oedipus complex is the nucleus of the neuroses. But if anyone feels reluctant about making this correction, there is no need for him to do so. On the one hand, we can extend the content of the Oedipus complex to include all the child's relations to both parents; or, on the other, we can take due account of our new findings by saying that the female only reaches the normal positive Oedipus situation after she has surmounted a period before it that is governed by the negative complex. And indeed during that phase a little girl's father is not much else for her than a troublesome rival, although her hostility towards him never reaches the pitch which is characteristic of boys. We have, after all, long given up any expectation of a neat parallelism between male and female sexual development.

Our insight into this early, pre-Oedipus, phase in girls comes to us as a surprise, like the discovery, in another field, of the Minoan-Mycenean civilization behind the civilization of Greece.

Everything in the sphere of this first attachment to the mother seemed to me so difficult to grasp in analysis - so grey with age and shadowy and almost impossible to revivify - that it was as if it had succumbed to an especially inexorable repression. But perhaps I gained this impression because the women who were in analysis with me were able to cling to the very attachment to the father in which they had taken refuge from the early phase that was in question. It does indeed appear that women analysts - as, for instance, Jeanne Lampl-de Groot and Helene Deutsch - have been able to perceive these facts more easily and clearly because they were helped in dealing with those under their treatment by the transference to a suitable mother-substitute. Nor have I succeeded in seeing my way through any case completely, and I shall therefore confine myself to reporting the most general findings and shall give only a few examples of the new ideas which I have arrived at. Among these is a suspicion that this phase of attachment to the mother is especially intimately related to the aetiology of hysteria, which is not surprising when we reflect that both the phase and the neurosis are characteristically feminine, and further, that in this dependence on the mother we have the germ of later paranoia in women.¹ For this germ appears to be the surprising, yet regular, fear of being killed (? devoured) by the mother. It is plausible to assume that this fear corresponds to a hostility which develops in the child towards her mother in consequence of the manifold restrictions imposed by the latter in the course of training and bodily care and that the mechanism of projection is favoured by the early age of the child's psychical organization.

¹ In the well-known case of delusional jealousy reported by Ruth Mack Brunswick (1928), the direct source of the disorder was the patient's pre-Oedipus fixation (to her sister).

II

I began by stating the two facts which have struck me as new: that a woman's strong dependence on her father merely takes over the heritage of an equally strong attachment to her mother, and that this earlier phase has lasted for an unexpectedly long period of time. I shall now go back a little in order to insert these new findings into the picture of female sexual development with which we are familiar. In doing this, a certain amount of repetition will be inevitable. It will help our exposition if, as we go along, we compare the state of things in women with that in men.

First of all, there can be no doubt that the bisexuality, which is present, as we believe, in the innate disposition of human beings, comes to the fore much more clearly in women than in men. A man, after all, has only one leading sexual zone, one sexual organ, whereas a woman has two: the vagina - the female organ proper - and the clitoris, which is analogous to the male organ. We believe we are justified in assuming that for many years the vagina is virtually non-existent and possibly does not produce sensations until puberty. It is true that recently an increasing number of observers report that vaginal impulses are present even in these early years. In women, therefore, the main genital occurrences of childhood must take place in relation to the clitoris. Their sexual life is regularly divided into two phases, of which the first has a masculine character, while only the second is specifically feminine. Thus in female development there is a process of transition from the one phase to the other, to which there is nothing analogous in the male. A further complication arises from the fact that the clitoris, with its virile character, continues to function in later female sexual life in a manner which is very variable and which is certainly not yet satisfactorily understood. We do not, of course, know the biological basis of these peculiarities in women; and still less are we able to assign them any teleological purpose.

Parallel with this first great difference there is the other, concerned with the finding of the object. In the case of a male, his mother becomes his first love-object as a result of her feeding him and looking after him, and she remains so until she is replaced by someone who resembles her or is derived from her. A female's first object, too, must be her mother: the primary conditions for a choice of object are, of course, the same for all children. But at the end of her development, her father - a man - should have become her new love-object. In other words, to the change in her own sex there must correspond a change in the sex of her object. The new problems that now require investigating are in what way this change takes place, how radically or how incompletely it is carried out, and what the different possibilities are which present themselves in the course of this development.

We have already learned, too, that there is yet another difference between the sexes, which relates to the Oedipus complex. We have an impression here that what we have said about the Oedipus complex applies with complete strictness to the male child only and that we are right in rejecting the term 'Electra complex' which seeks to emphasize the analogy between the attitude of the two sexes. It is only in the male child that we find the fateful combination of love for the one parent and simultaneous hatred for the other as a rival. In his case it is the discovery of the possibility of castration, as proved by the sight of the female genitals, which forces on him the transformation of his Oedipus complex, and which leads to the creation of his super-ego and thus initiates all the processes that are designed to make the individual find a place in the cultural community. After the paternal agency has been internalized and become a super-ego, the next task is to detach the latter from the figures of whom it was originally the psychical representative. In this remarkable course of development it is precisely the boy's narcissistic interest in his genitals - his interest in preserving his penis - which is turned round into a curtailing of his infantile sexuality.

One thing that is left over in men from the influence of the Oedipus complex is a certain amount of disparagement in their attitude towards women, whom they regard as being castrated. In extreme cases this gives rise to an inhibition in their choice of object, and, if it is supported by organic factors, to exclusive homosexuality.

Quite different are the effects of the castration complex in the female. She acknowledges the fact of her castration, and with it, too, the superiority of the male and her own inferiority; but she rebels against this unwelcome state of affairs. From this divided attitude three lines of development open up. The first leads to a general revulsion from sexuality. The little girl, frightened by the comparison with boys, grows dissatisfied with her clitoris, and gives up her phallic activity and with it her sexuality in general as well as a good part of her masculinity in other fields. The second line leads her to cling with defiant self-assertiveness to her threatened masculinity. To an incredibly late age she clings to the hope of getting a penis some time. That hope becomes her life's aim; and the phantasy of being a man in spite of everything often persists as a formative factor over long periods. This 'masculinity complex' in women can also result in a manifest homosexual choice of object. Only if her development follows the third, very circuitous, path does she reach the final normal female attitude, in which she takes her father as her object and so finds her way to the feminine form of the Oedipus complex. Thus in women the Oedipus complex is the end-result of a fairly lengthy development. It is not destroyed, but created, by the influence of castration; it escapes the strongly hostile influences which, in the male, have a destructive effect on it, and indeed it is all too often not surmounted by the female at all. For this reason, too, the cultural consequences of its break-up are smaller and of less importance in her. We should probably not be wrong in saying that it is this difference in the reciprocal relation between the Oedipus and the castration complex which gives its special stamp to the character of females as social beings.¹

¹ It is to be anticipated that men analysts with feminist views, as well as our women analysts, will disagree with what I have said here. They will hardly fail to object that such notions spring from the 'masculinity complex' of the male and are designed to justify on theoretical grounds his innate inclination to disparage and suppress women. But this sort of psycho-analytic argumentation reminds us here, as it so often does, of Dostoevsky's famous 'knife that cuts both ways'. The opponents of those who argue in this way will on their side think it quite natural that the female sex should refuse to accept a view which appears to contradict their eagerly coveted equality with men. The use of analysis as a weapon of controversy can clearly lead to no decision.

We see, then, that the phase of exclusive attachment to the mother, which may be called the *pre-Oedipus* phase, possesses a far greater importance in women than it can have in men. Many phenomena of female sexual life which were not properly understood before can be fully explained by reference to this phase. Long ago, for instance, we noticed that many women who have chosen their husband on the model of their father, or have put him in their father's place, nevertheless repeat towards him, in their married life, their bad relations with their mother. The husband of such a woman was meant to be the inheritor of her relation to her father, but in reality he became the inheritor of her relation to her mother. This is easily explained as an obvious case of regression. Her relation to her mother was the original one, and her attachment to her father was built up on it, and now, in marriage, the original relation emerges from repression. For the main content of her development to womanhood lay in the carrying over of her affective object attachments from her mother to her father.

With many women we have the impression that their years of maturity are occupied by a struggle with their husband, just as their youth was spent in a struggle with their mother. In the light of the previous discussions we shall conclude that their hostile attitude to their mother is not a consequence of the rivalry implicit in the Oedipus complex, but originates from the preceding phase and has merely been reinforced and exploited in the Oedipus situation. And actual analytic examination confirms this view. Our interest must be directed to the mechanisms that are at work in her turning away from the mother who was an object so intensely and exclusively loved. We are prepared to find, not a single factor, but a whole number of them operating together towards the same end,

Among these factors are some which are determined by the circumstances of infantile sexuality in general, and so hold good equally for the erotic life of boys. First and foremost we may mention jealousy of other people - of brothers and sisters, rivals, among whom the father too has a place. Childhood love is boundless; it demands exclusive possession, it is not content with less than all. But it has a second characteristic: it has, in point of fact, no aim and is incapable of obtaining complete satisfaction; and principally for that reason it is doomed to end in disappointment and to give place to a hostile attitude. Later on in life the lack of an ultimate satisfaction may favour a different result. This very factor may ensure the uninterrupted continuance of the libidinal cathexis, as happens with love-relations that are inhibited in their aim. But in the stress of the processes of development it regularly happens that the libido abandons its unsatisfying position in order to find a new one.

Another, much more specific motive for turning away from the mother arises from the effect of the castration complex on the creature who is without a penis. At some time or other the little girl makes the discovery of her organic inferiority - earlier and more easily, of course, if there are brothers or other boys about. We have already taken note of the three paths which diverge from this point: (a) the one which leads to a cessation of her whole sexual life, (b) the one which leads to a defiant over-emphasis of her masculinity, and (c) the first steps towards definitive femininity. It is not easy to determine the exact timing here or the typical course of events. Even the point of time when the discovery of castration is made varies, and a number of other factors seem to be inconstant and to depend on chance. The state of the girl's own phallic activity plays a part; and so too does the question whether this activity was found out or not, and how much interference with it she experienced afterwards.

Little girls usually discover for themselves their characteristic phallic activity - masturbation of the clitoris; and to begin with this is no doubt unaccompanied by phantasy. The part played in starting it by nursery hygiene is reflected in the very common phantasy which makes the mother or nurse into a seducer. Whether little girls masturbate less frequently and from the first less energetically than little boys is not certain; quite possibly it is so. Actual seduction, too, is common enough; it is initiated either by other children or by someone in charge of the child who wants to soothe it, or send it to sleep or make it dependent on them. Where seduction intervenes it invariably disturbs the natural course of the developmental processes, and it often leaves behind extensive and lasting consequences.

A prohibition of masturbation, as we have seen, becomes an incentive for giving it up; but it also becomes a motive for rebelling against the person who prohibits it - that is to say, the mother, or the mother-substitute who later regularly merges with her. A defiant persistence in masturbation appears to open the way to masculinity. Even where the girl has not succeeded in suppressing her masturbation, the effect of the apparently vain prohibition is seen in her later efforts to free herself at all costs from a satisfaction which has been spoilt for her. When she reaches maturity her object-choice may still be influenced by this persisting purpose. Her resentment at being prevented from free sexual activity plays a big part in her detachment from her mother. The same motive comes into operation again after puberty, when her mother takes up her duty of guarding her daughter's chastity. We shall, of course, not forget that the mother is similarly opposed to a boy's masturbating and thus provides him, too, with a strong motive for rebellion.

When the little girl discovers her own deficiency, from seeing a male genital, it is only with hesitation and reluctance that she accepts the unwelcome knowledge. As we have seen, she clings obstinately to the expectation of one day having a genital of the same kind too, and her wish for it survives long after her hope has expired. The child invariably regards castration in the first instance as a misfortune peculiar to herself; only later does she realize that it extends to certain other children and lastly to certain grown-ups. When she comes to understand the general nature of this characteristic, it follows that femaleness - and with it, of course, her mother - suffers a great depreciation in her eyes.

This account of how girls respond to the impression of castration and the prohibition against masturbation will very probably strike the reader as confused and contradictory. This is not entirely the author's fault. In truth, it is hardly possible to give a description which has general validity. We find the most different reactions in different individuals, and in the same individual the contrary attitudes exist side by side. With the first intervention of the prohibition, the conflict is there, and from now on it will accompany the development of the sexual function. Insight into what takes place is made particularly difficult by the fact of its being so hard to distinguish the mental processes of this first phase from later ones by which they are overlaid and are distorted in memory. Thus, for instance, a girl may later construe the fact of castration as a punishment for her masturbatory activity, and she will attribute the carrying out of this punishment to her father, but neither of these ideas can have been a primary one. Similarly, boys regularly fear castration from their father, although in their case, too, the threat most usually comes from their mother.

However this may be, at the end of this first phase of attachment to the mother, there emerges, as the girl's strongest motive for turning away from her, the reproach that her mother did not give her a proper penis - that is to say, brought her into the world as a female. A second reproach, which does not reach quite so far back, is rather a surprising one. It is that her mother did not give her enough milk, did not suckle her long enough. Under the conditions of modern civilization this may be true often enough, but certainly not so often as is asserted in analyses. It would seem rather that this accusation gives expression to the general dissatisfaction of children, who, in our monogamous civilization, are weaned from the breast after six or nine months, whereas the primitive mother devotes herself exclusively to her child for two or three years. It is as though our children had remained for ever unsated, as though they had never sucked long enough at their mother's breast. But I am not sure whether, if one analysed children who had been suckled as long as the children of primitive peoples, one would not come upon the same complaint. Such is the greed of a child's libido!

When we survey the whole range of motives for turning away from the mother which analysis brings to light - that she failed to provide the little girl with the only proper genital, that she did not feed her sufficiently, that she compelled her to share her mother's love with others, that she never fulfilled all the girl's expectations of love, and, finally, that she first aroused her sexual activity and then forbade it - all these motives seem nevertheless insufficient to justify the girl's final hostility. Some of them follow inevitably from the nature of infantile sexuality; others appear like rationalizations devised later to account for the uncomprehended change in feeling. Perhaps the real fact is that the attachment to the mother is bound to perish, precisely because it was the first and was so intense; just as one can often see happen in the first marriages of young women which they have entered into when they were most passionately in love. In both situations the attitude of love probably comes to grief from the disappointments that are unavoidable and from the accumulation of occasions for aggression. As a rule, second marriages turn out much better.

We cannot go so far as to assert that the ambivalence of emotional cathexes is a universally valid law, and that it is absolutely impossible to feel great love for a person without its being accompanied by a hatred that is perhaps equally great, or vice versa. Normal adults do undoubtedly succeed in separating those two attitudes from each other, and do not find themselves obliged to hate their love-objects and to love their enemy as well as hate him. But this seems to be the result of later developments. In the first phases of erotic life, ambivalence is evidently the rule. Many people retain this archaic trait all through their lives. It is characteristic of obsessional neurotics that in their object-relationships love and hate counterbalance each other. In primitive races, too, we may say that ambivalence predominates. We shall conclude, then, that the little girl's intense attachment to her mother is strongly ambivalent, and that it is in consequence precisely of this ambivalence that (with the assistance of the other factors we have adduced) her attachment is forced away from her mother - once again, that is to say, in consequence of a general characteristic of infantile sexuality.

The explanation I have attempted to give is at once met by a question: 'How is it, then, that boys are able to keep intact their attachment to their mother, which is certainly no less strong than that of girls?' The answer comes equally promptly: 'Because boys are able to deal with their ambivalent feelings towards their mother by directing all their hostility on to their father.' But, in the first place, we ought not to make this reply until we have made a close study of the pre-Oedipus phase in boys, and, in the second place, it is probably more prudent in general to admit that we have as yet no clear understanding of these processes, with which we have only just become acquainted.

III

A further question arises: 'What does the little girl require of her mother? What is the nature of her sexual aims during the time of exclusive attachment to her mother?' The answer we obtain from the analytic material is just what we should expect. The girl's sexual aims in regard to her mother are active as well as passive and are determined by the libidinal phases through which the child passes. Here the relation of activity to passivity is especially interesting. It can easily be observed that in every field of mental experience, not merely that of sexuality, when a child receives a passive impression it has a tendency to produce an active reaction. It tries to do itself what has just been done to it. This is part of the work imposed on it of mastering the external world and can even lead to its endeavouring to repeat an impression which it would have reason to avoid on account of its distressing content. Children's play, too, is made to serve this purpose of supplementing a passive experience with an active piece of behaviour and of thus, as it were, annulling it. When a doctor has opened a child's mouth, in spite of his resistance, to look down his throat, the same child, after the doctor has gone, will play at being the doctor himself, and will repeat the assault upon some small brother or sister who is as helpless in his hands as he was in the doctor's. Here we have an unmistakable revolt against passivity and a preference for the active role. This swing-over from passivity to activity does not take place with the same regularity or vigour in all children; in some it may not occur at all. A child's behaviour in this respect may enable us to draw conclusions as to the relative strength of the masculinity and femininity that it will exhibit in its sexuality.

The first sexual and sexually coloured experiences which a child has in relation to its mother are naturally of a passive character. It is suckled, fed, cleaned, and dressed by her, and taught to perform all its functions. A part of its libido goes on clinging to those experiences and enjoys the satisfactions bound up with them; but another part strives to turn them into activity. In the first place, being suckled at the breast gives place to active sucking. As regards the other experiences the child contents itself either with becoming self-sufficient - that is, with itself successfully carrying out what had hitherto been done for it - or with repeating its passive experiences in an active form in play; or else it actually makes its mother into the object and behaves as the active subject towards her. For a long time I was unable to credit this last behaviour, which takes place in the field of real action, until my observations removed all doubts on the matter.

We seldom hear of a little girl's wanting to wash or dress her mother, or tell her to perform her excretory functions. Sometimes, it is true, she says: 'Now let's play that I'm the mother and you're the child'; but generally she fulfils these active wishes in an indirect way, in her play with her doll, in which she represents the mother and the doll the child. The fondness girls have for playing with dolls, in contrast to boys, is commonly regarded as a sign of early awakened femininity. Not unjustly so; but we must not overlook the fact that what finds expression here is the *active* side of femininity, and that the little girl's preference for dolls is probably evidence of the exclusiveness of her attachment to her mother, with complete neglect of her father-object.

The very surprising sexual activity of little girls in relation to their mother is manifested chronologically in oral, sadistic, and finally even in phallic trends directed towards her. It is difficult to give a detailed account of these because they are often obscure instinctual impulses which it was impossible for the child to grasp psychically at the time of their occurrence, which were therefore only interpreted by her later, and which then appear in the analysis in forms of expression that were certainly not the original ones. Sometimes we come across them as transferences on to the later, father-object, where they do not belong and where they seriously interfere with our understanding of the situation. We find the little girl's aggressive oral and sadistic wishes in a form forced on them by early repression, as a fear of being killed by her mother - a fear which, in turn, justifies her death-wish against her mother, if that becomes conscious. It is impossible to say how often this fear of the mother is supported by an unconscious hostility on the mother's part which is sensed by the girl. (Hitherto, it is only in men that I have found the fear of being eaten up. This fear is referred to the father, but it is probably the product of a transformation of oral aggressivity directed to the mother. The child wants to eat up its mother from whom it has had its nourishment; in the case of the father there is no such obvious determinant for the wish.)

The women patients showing a strong attachment to their mother in whom I have been able to study the pre-Oedipus phase have all told me that when their mother gave them enemas or rectal douches they used to offer the greatest resistance and react with fear and screams of rage. This behaviour may be very frequent or even the habitual thing in children. I only came to understand the reason for such a specially violent opposition from a remark made by Ruth Mack Brunswick, who was studying these problems at the same time as I was, to the effect that she was inclined to compare the outbreak of anger after an enema to the orgasm following genital excitation. The accompanying anxiety should, she thought, be construed as a transformation of the desire for aggression which had been stirred up. I believe that this is really so and that, at the sadistic-anal level, the intense passive stimulation of the intestinal zone is responded to by an outbreak of desire for aggression which is manifested either directly as rage, or, in consequence of its suppression, as anxiety. In later years this reaction seems to die away.

In regard to the passive impulses of the phallic phase, it is noteworthy that girls regularly accuse their mother of seducing them. This is because they necessarily received their first, or at any rate their strongest, genital sensations when they were being cleaned and having their toilet attended to by their mother (or by someone such as a nurse who took her place). Mothers have often told me, as a matter of observation, that their little daughters of two and three years old enjoy these sensations and try to get their mothers to make them more intense by repeated touching and rubbing. The fact that the mother thus unavoidably initiates the child into the phallic phase is, I think, the reason why, in phantasies of later years, the father so regularly appears as the sexual seducer. When the girl turns away from her mother, she also makes over to her father her introduction into sexual life.

Lastly, intense *active* wishful impulses directed towards the mother also arise during the phallic phase. The sexual activity of this period culminates in clitoral masturbation. This is probably accompanied by ideas of the mother, but whether the child attaches a sexual aim to the idea, and what that aim is, I have not been able to discover from my observations. It is only when all her interests have received a fresh impetus through the arrival of a baby brother or sister that we can clearly recognize such an aim. The little girl wants to believe that she has given her mother the new baby, just as the boy wants to; and her reaction to this event and her behaviour to the baby is exactly the same as his. No doubt this sounds quite absurd, but perhaps that is only because it sounds so unfamiliar.

The turning-away from her mother is an extremely important step in the course of a little girl's development. It is more than a mere change of object. We have already described what takes place in it and the many motives put forward for it; we may now add that hand in hand with it there is to be observed a marked lowering of the active sexual impulses and a rise of the passive ones. It is true that the active trends have been affected by frustration more strongly; they have proved totally unrealizable and are therefore abandoned by the libido more readily. But the passive trends have not escaped disappointment either. With the turning-away from the mother clitoral masturbation frequently ceases as well; and often enough when the small girl represses her previous masculinity a considerable portion of her sexual trends in general is permanently injured too. The transition to the father-object is accomplished with the help of the passive trends in so far as they have escaped the catastrophe. The path to the development of femininity now lies open to the girl, to the extent to which it is not restricted by the remains of the pre-Oedipus attachment to her mother which she has surmounted.

If we now survey the stage of sexual development in the female which I have been describing, we cannot resist coming to a definite conclusion about female sexuality as a whole. We have found the same libidinal forces at work in it as in the male child and we have been able to convince ourselves that for a period of time these forces follow the same course and have the same outcome in each.

Biological factors subsequently deflect those libidinal forces from their original aims and conduct even active and in every sense masculine trends into feminine channels. Since we cannot dismiss the notion that sexual excitation is derived from the operation of certain chemical substances, it seems plausible at first to expect that biochemistry will one day disclose a substance to us whose presence produces a male sexual excitation and another substance which produces a female one. But this hope seems no less naïve than the other one - happily obsolete to-day - that it may be possible under the microscope to isolate the different exciting factors of hysteria, obsessional neurosis, melancholia, and so on.

Even in sexual chemistry things must be rather more complicated. For psychology, however, it is a matter of indifference whether there is a single sexually exciting substance in the body or two or countless numbers of them. Psycho-analysis teaches us to manage with a single libido, which, it is true, has both active and passive aims (that is, modes of satisfaction). This antithesis and, above all, the existence of libidinal trends with passive aims, contains within itself the remainder of our problem.

IV

An examination of the analytic literature on the subject shows that everything that has been said by me here is already to be found in it. It would have been superfluous to publish this paper if it were not that in a field of research which is so difficult of access every account of first-hand experiences or personal views may be of value. Moreover, there are a number of points which I have defined more sharply and isolated more carefully. In some of the other papers on the subject the description is obscured because they deal at the same time with the problems of the super-ego and the sense of guilt. This I have avoided doing. Also, in describing the various outcomes of this phase of development, I have refrained from discussing the complications which arise when a child, as a result of disappointment from her father, returns to the attachment to her mother which she had abandoned, or when, in the course of her life, she repeatedly changes over from one position to the other. But precisely because my paper is only one contribution among others, I may be spared an exhaustive survey of the literature, and I can confine myself to bringing out the more important points on which I agree or disagree with these other writings.

Abraham's (1921) description of the manifestations of the castration complex in the female is still unsurpassed; but one would be glad if it had included the factor of the girl's original exclusive attachment to her mother. I am in agreement with the principal points in Jeanne Lampl-de Groot's¹ (1927) important paper. In this the complete identity of the pre-Oedipus phase in boys and girls is recognized, and the girl's sexual (phallic) activity towards her mother is affirmed and substantiated by observations. The turning-away from the mother is traced to the influence of the girl's recognition of castration, which obliges her to give up her sexual object, and often masturbation along with it. The whole development is summed up in the formula that the girl goes through a phase of the 'negative' Oedipus complex before she can enter the positive one. A point on which I find the writer's account inadequate is that it represents the turning-away from the mother as being merely a change of object and does not discuss the fact that it is accompanied by the plainest manifestations of hostility. To this hostility full justice is done in Helene Deutsch's latest paper, on feminine masochism and its relation to frigidity (1930), in which she also recognizes the girl's phallic activity and the intensity of her attachment to her mother. Helene Deutsch states further that the girl's turning towards her father takes place *via* her passive trends (which have already been awakened in relation to her mother). In her earlier book (1925) the author had not yet set herself free from the endeavour to apply the Oedipus pattern to the pre-Oedipus phase, and she therefore interpreted the little girl's phallic activity as an identification with her father.

¹ The author's name was given when it appeared in the *Zeitschrift* as 'A. Lampl-de Groot', and I correct it here at her request.

Fenichel (1930) rightly emphasizes the difficulty of recognizing in the material produced in analysis what parts of it represent the unchanged content of the pre-Oedipus phase and what parts have been distorted by regression (or in other ways). He does not accept Jeanne Lampl-de Groot's assertion of the little girl's active attitude in the phallic phase. He also rejects the 'displacement backwards' of the Oedipus complex proposed by Melanie Klein (1928), who places its beginnings as early as the commencement of the second year of life. This dating of it, which would also necessarily imply a modification of our view of all the rest of the child's development, does not in fact correspond to what we learn from the analyses of adults, and it is especially incompatible with my findings as to the long duration of the girl's pre-Oedipus attachment to her mother. A means of softening this contradiction is afforded by the reflection that we are not as yet able to distinguish in this field between what is rigidly fixed by biological laws and what is open to movement and change under the influence of accidental experience. The effect of seduction has long been familiar to us and in just the same way other factors - such as the date at which the child's brothers and sisters are born or the time when it discovers the difference between the sexes, or again its direct observations of sexual intercourse or its parents' behaviour in encouraging or repelling it - may hasten the child's sexual development and bring it to maturity.

Some writers are inclined to reduce the importance of the child's first and most original libidinal impulses in favour of later developmental processes, so that - to put this view in its most extreme form - the only role left to the former is merely to indicate certain paths, while the intensities which flow along those paths are supplied by later regressions and reaction-formations. Thus, for instance, Karin Horney (1926) is of the opinion that we greatly over-estimate the girl's primary penis-envy and that the strength of the masculine trend which she develops later is to be attributed to a *secondary* penis-envy which is used to fend off her feminine impulses and, in particular, her feminine attachment to her father. This does not tally with my impressions. Certain as is the occurrence of later reinforcements through regression and reaction-formation, and difficult as it is to estimate the relative strength of the confluent libidinal components, I nevertheless think that we should not overlook the fact that the first libidinal impulses have an intensity of their own which is superior to any that come later and which may indeed be termed incommensurable. It is undoubtedly true that there is an antithesis between the attachment to the father and the masculinity complex; it is the general antithesis that exists between activity and passivity, masculinity and femininity. But this gives us no right to assume that only one of them is primary and that the other owes its strength merely to the force of defence. And if the defence against femininity is so energetic, from what other source can it draw its strength than from the masculine trend which found its first expression in the child's penis-envy and therefore deserves to be named after it?

A similar objection applies to Ernest Jones's view (1927) that the phallic phase in girls is a secondary, protective reaction rather than a genuine developmental stage. This does not correspond either to the dynamic or the chronological position of things.

DR. REIK AND THE PROBLEM OF QUACKERY
A LETTER TO THE *NEUE FREIE PRESSE*
(1926)

Dear Sir,

In an article in your issue of July 15 dealing with the case of my pupil, Dr. Theodor Reik, or, more precisely, in a section of it headed 'Information from Psycho-Analytic Circles', there is a passage on which I should like to make a few remarks by way of correction.

The passage runs: '... during the last few years he has become convinced that Dr. Reik, who has gained a wide reputation from his philosophical and psychological writings, possesses a far greater gift for psycho-analysis than the physicians attached to the Freudian school; and he has entrusted the most difficult cases only to him and to his daughter Anna, who has proved quite specially adept in the difficult technique of psycho-analysis.'

Dr. Reik himself would, I think, be the first to reject any such account of the basis of our relations. It is true, however, that I have availed myself of his skill in particularly difficult cases, but this has only been where the symptoms lay in a sphere far removed from the physical one. And I have never failed to inform a patient that he is not a physician but a psychologist.

My daughter Anna has devoted herself to the pedagogic analysis of children and adolescents. I have never yet referred to her a case of severe neurotic illness in an adult. Incidentally the only case with moderately severe symptoms verging on the psychiatric which she has hitherto treated repaid the physician who referred it to her by its complete success.

I take the opportunity of informing you that I have just sent to press a small work on *The Question of Lay Analysis*. In it I have tried to show what a psycho-analysis is and what demands it makes on the analyst. I have considered the far from simple relations between psycho-analysis and medicine, and have drawn the conclusion that any mechanical application to trained analysts of the section against quackery is open to grave doubts.

Since I have given up my Vienna practice and have cut down my activity to the treatment of a very few foreigners, I trust that this announcement will not involve me too in a prosecution for unprofessional advertisement.

Yours &c.,
Professor Freud

DR. ERNEST JONES
(ON HIS 50th BIRTHDAY)
(1929)

The first piece of work that it fell to psycho-analysis to perform was the discovery of the instincts that are common to all men living to-day - and not only to those living to-day but to those of ancient and of prehistoric times. It called for no great effort, therefore, for psycho-analysis to ignore the differences that arise among the inhabitants of the earth owing to the multiplicity of races, languages and countries. From the start it was *international*, and it is well known that its followers overcame the dividing effects of the Great War sooner than any others.

Among the men who met at Salzburg in the spring of 1908 for the first psycho-analytical congress, a young English physician was prominent, who delivered a short paper on 'Rationalization in Everyday Life'. The contents of this first-fruit hold good to this day: our young science was enriched by an important concept and an indispensable term.

From that time on Ernest Jones has never rested. First in his post as a professor in Toronto, then as a physician in London, as the founder and teacher of a Branch Society, as director of a Press, as editor of a Journal, and as head of a Training Institute, he has worked tirelessly for psycho-analysis, making its current findings generally known by means of lectures, defending it against the attacks and misunderstandings of its opponents by means of brilliant, severe but fair criticisms, maintaining its difficult position in England against the demands of the 'profession' with tact and moderation, and, alongside of all these externally directed activities, accomplishing, in loyal co-operation with the development of psycho-analysis on the Continent, the scientific achievement to which, among other works, his *Papers on Psycho-Analysis* and *Essays in Applied Psycho-Analysis* bear witness. Now, in the prime of life, he is not only indisputably the leading figure among English-speaking analysts, but is also recognized as one of the foremost representatives of psycho-analysis as a whole - a mainstay for his friends and, as much as ever, a hope for the future of our science.

Now that the Director of this journal has broken the silence to which he is condemned - or to which he has a right - owing to his age, in order to greet his friend, he may be permitted to conclude - not with a wish, for we do not believe in the omnipotence of thoughts - but with the admission that he cannot think of Ernest Jones, even after his fiftieth birthday, as other than before: zealous and energetic, combative and devoted to the cause.

THE EXPERT OPINION IN THE HALSMANN CASE (1931)

The Oedipus complex, as far as we know, is present in childhood in all human beings, undergoes great alterations during the years of development and in many individuals is found in varying degrees of strength even at a mature age. Its essential characteristics, its universality, its content and its fate were recognized, long before the days of psycho-analysis, by that acute thinker Diderot, as is shown by a passage in his famous dialogue, *Le neveu de Rameau*: 'Si le petit sauvage était abandonné à lui-même, qu'il conservât tout son imbécillité, et qu'il réunit au peu de raison de l'enfant au berceau la violence des passions de l'homme de trente ans, il tordrait le cou à son père, et coucherait avec sa mère.'

If it had been objectively demonstrated that Philipp Halsmann murdered his father, there would at all events be some grounds for introducing the Oedipus complex to provide a motive for an otherwise unexplained deed. Since no such proof has been adduced, mention of the Oedipus complex has a misleading effect; it is at the least idle. Such disagreements as have been uncovered by the investigation in the Halsmann family between the father and son are altogether inadequate to provide a foundation for assuming in the son a bad relationship towards his father. Even if it were otherwise, we should be obliged to say that it is a far cry from there to the causation of such a deed. Precisely because it is always present, the Oedipus complex is not suited to provide a decision on the question of guilt. The situation envisaged in a well-known anecdote might easily be brought about. There was a burglary. A man who had a jemmy in his possession was found guilty of the crime. After the verdict had been given and he had been asked if he had anything to say, he begged to be sentenced for adultery at the same time - since he was carrying the tool for that on him as well.

In Dostoevsky's great novel, *The Brothers Karamazov*, the Oedipus situation stands at the focal point of interest. Old Karamazov has made himself detested by his sons through heartless oppression; in the eyes of one of them he is, in addition, a powerful rival for the woman he desires. This son, Dmitri, makes no secret of his intention to avenge himself on his father by force. It is therefore natural that after his father has been murdered and robbed he should be accused as his murderer and, despite all protestations of his innocence, condemned. And yet Dmitri is innocent; another of the brothers has done the deed. A dictum that has become famous occurs during the trial scene in this novel: 'Psychology is a knife that cuts both ways.'

The Opinion of the Innsbruck Faculty of Medicine seems inclined to attribute an 'effective' Oedipus complex to Philipp Halsmann, but refrains from defining the measure of this effectiveness, since under the pressure of the accusation the necessary conditions for 'an unreserved disclosure' on Philipp Halsmann's part were not fulfilled. When the Faculty go on to refuse even 'on the supposition of the accused being guilty to look for the root of the deed in an Oedipus complex', they are carrying their denial too far without any necessity.

In the same Opinion, we come up against a contradiction which is by no means without significance. The possible influence of emotional shock on the disturbance of memory with regard to impressions before and during the critical time is minimized to the extreme, in my opinion unjustly. The assumptions of an exceptional state of mind or of mental illness are decisively rejected, but the explanation of a 'repression' having taken place in Philipp Halsmann after the deed is readily allowed. I must say, however, that a repression of this kind, occurring out of the blue in an adult who gives no indication of a severe neurosis - the repression of an action which would certainly be more important than any debatable details of distance and the passage of time and which takes place in a normal state or one altered only by physical fatigue - would be a rarity of the first order.

INTRODUCTION TO THE SPECIAL PSYCHOPATHOLOGY NUMBER OF
THE MEDICAL REVIEW OF REVIEWS
(1930)

Dr. Feigenbaum has asked me to write a few words for the Review of which he is in charge, and I take the opportunity of wishing the best success to his undertaking.

I often hear that psycho-analysis is very popular in the United States and that it does not come up against the same stubborn resistance there as it does in Europe. My satisfaction over this is, however, clouded by several circumstances. It seems to me that the popularity of the name of psycho-analysis in America signifies neither a friendly attitude to the thing itself nor any specially wide or deep knowledge of it. As evidence of the former fact I may point out that, although financial support is to be had easily and in plenty for every kind of scientific and pseudo-scientific enterprise, we have never succeeded in obtaining a backing for our psycho-analytic institutions. Nor is it hard to find evidence for my second assertion. Although America possesses several excellent analysts and, in Dr. A. A. Brill, at least one authority, the contributions to our science from that vast country are exiguous and provide little that is new. Psychiatrists and neurologists make frequent use of psycho-analysis as a therapeutic method, but as a rule they show little interest in its scientific problems and its cultural significance. Quite particularly often we find in American physicians and writers a very insufficient familiarity with psycho-analysis, so that they know only its terms and a few catch-words - though this does not shake them in the certainty of their judgement. And these same men lump psycho-analysis with other systems of thought, which may have developed out of it but are incompatible with it to-day. Or they make a hotch-potch out of psycho-analysis and other elements and quote this procedure as evidence of their *broad-mindedness*, whereas it only proves their *lack of judgement*.

Many of these evils which I have mentioned with regret no doubt arise from the fact that there is a general tendency in America to shorten study and preparation and to proceed as fast as possible to practical application. There is a preference, too, for studying a subject like psycho-analysis not from the original sources but from second-hand and often inferior accounts. Thoroughness is bound to suffer from this.

It is to be hoped that works of the kind that Dr. Feigenbaum intends to publish in his Review will be a powerful encouragement to the interest in psycho-analysis in America.

INTRODUCTION TO EDOARDO WEISS'S *ELEMENTS OF PSYCHO-ANALYSIS*
(1931)

The author of these lectures, my friend and pupil Dr. Edoardo Weiss, has expressed a wish that I should send his work on its way with a few words of recommendation. In doing so I am fully aware that such a recommendation is superfluous. The work speaks for itself. All who know how to appreciate the seriousness of a scientific endeavour, how to value the honesty of an investigator who does not seek to belittle or deny the difficulties, and how to take pleasure in the skill of a teacher who brings light into darkness and order into chaos by his exposition, must form a high estimate of this book and share my hope that it will awaken among cultivated and learned circles in Italy a lasting interest in the young science of psycho-analysis.

Sigm. Freud

PREFACE TO *TEN YEARS OF THE BERLIN PSYCHO-ANALYTIC INSTITUTE*
(1930)

The following pages describe the founding and achievements of the Berlin Psycho-Analytic Institute, to which are allotted three important functions within the psycho-analytic movement. First, it endeavours to make our therapy accessible to the great multitude who suffer under their neuroses no less than the wealthy, but who are not in a position to meet the cost of their treatment. Secondly, it seeks to provide a centre at which analysis can be taught theoretically and at which the experience of older analysts can be handed on to pupils who are anxious to learn. And lastly, it aims at perfecting our knowledge of neurotic illnesses and our therapeutic technique by applying them and testing them under fresh conditions.

An Institute of this kind was indispensable; but we should have waited in vain for assistance from the State or interest from the University in its foundation. Here the energy and self-sacrifice of an individual analyst took the initiative. Ten years ago, Dr. Max Eitingon, now President of the International Psycho-Analytical Association, created an Institute such as this from his own resources, and has since then maintained and directed it by his own efforts. This Report on the first decade of the Berlin Institute is a tribute to its creator and director - an attempt to render him public thanks. Everyone who, in whatever sense, has a share in psycho-analysis will unite in thus thanking him.

PREFACE TO HERMANN NUNBERG'S
GENERAL THEORY OF THE NEUROSES ON A PSYCHO-ANALYTIC BASIS
(1932)

This volume by Hermann Nunberg contains the most complete and conscientious presentation of a psycho-analytic theory of neurotic processes which we at present possess. Anyone who is anxious to have the relevant problems simplified and smoothed away will scarcely find satisfaction in this work. But anyone who prefers scientific thinking and can appreciate it as a merit when speculation never abandons the guiding-line of experience and anyone who can enjoy the beautiful diversity of mental happenings - he will value this work and study it assiduously.

VIENNA, *October* 1931.

LETTER TO THE BURGOMASTER OF PRÍBOR
(1931)

I offer my thanks to the Burgomaster of the town of Příbor-Freiberg, to the organizers of this celebration and to all those who are attending it, for the honour they have done me in marking the house of my birth with this commemorative tablet from an artist's hand - and this during my lifetime and while the world around us is not yet agreed in its estimate of my work.

I left Freiberg at the age of three and visited it when I was sixteen, during my school holidays, as a guest of the Fluss family, and I have never returned to it again. Since that time much has befallen me; my labours have been many, I have experienced some suffering and happiness as well, and I have had a share of success - the common medley of human life. At seventy-five it is not easy for me to put myself back into those early times; of their rich experiences but few relics remain in my memory. But of one thing I can feel sure: deeply buried within me there still lives the happy child of Freiberg, the first-born son of a youthful mother, who received his first indelible impressions from this air, from this soil. Thus I may be allowed to end my words of thanks with a heartfelt wish for the happiness of this place and of those who live in it.

NEW INTRODUCTORY LECTURES ON PSYCHO-ANALYSIS
(1933)

Intentionally left blank

PREFACE

My *Introductory Lectures on Psycho-Analysis* were delivered during the two Winter Terms of 1915-16 and 1916-17 in a lecture room of the Vienna Psychiatric Clinic before an audience gathered from all the Faculties of the University. The first half of the lectures were improvised, and written out immediately afterwards; drafts of the second half were made during the intervening summer vacation at Salzburg, and delivered word for word in the following winter. At that time I still possessed the gift of a phonographic memory.

These new lectures, unlike the former ones, have never been delivered. My age had in the meantime absolved me from the obligation of giving expression to my membership of the University (which was in any case a peripheral one) by delivering lectures; and a surgical operation had made speaking in public impossible for me. If, therefore, I once more take my place in the lecture room during the remarks that follow, it is only by an artifice of the imagination; it may help me not to forget to bear the reader in mind as I enter more deeply into my subject.

The new lectures are by no means intended to take the place of the earlier ones. They do not in any sense form an independent entity with an expectation of finding a circle of readers of its own; they are continuations and supplements, which, in relation to the former series, fall into three groups. A first group contains fresh treatments of subjects which were already dealt with fifteen years ago but which, as a result of a deepening of our knowledge and an alteration in our views, call for a different exposition to-day - that is to say, critical revisions. The two other groups contain what are true extensions, for they deal with things which either did not exist in psycho-analysis at the time of the first lectures or which were too little in evidence to justify a special chapter-heading. It is inevitable, but not to be regretted, if some of the new lectures unite the characteristics of more than one of these groups.

I have also given expression to the dependence of these new lectures on the *Introductory Lectures* by giving them a numbering continuous with theirs. The first lecture in this volume is accordingly called No. XXIX. Like their predecessors, they offer the professional analyst little that is new; they are addressed to the multitude of educated people to whom we may perhaps attribute a benevolent, even though cautious, interest in the characteristics and discoveries of the young science. This time once again it has been my chief aim to make no sacrifice to an appearance of being simple, complete or rounded-off, not to disguise problems and not to deny the existence of gaps and uncertainties. In no other field of scientific work would it be necessary to boast of such modest intentions. They are universally regarded as self-evident; the public expects nothing else. No reader of an account of astronomy will feel disappointed and contemptuous of the science if he is shown the frontiers at which our knowledge of the universe melts into haziness. Only in psychology is it otherwise. There mankind's constitutional unfitness for scientific research comes fully into the open. What people seem to demand of psychology is not progress in knowledge, but satisfactions of some other sort; every unsolved problem, every admitted uncertainty is made into a reproach against it.

Whoever cares for the science of mental life must accept these injustices along with it.

FREUD

VIENNA, *Summer* 1932

LECTURE XXIX

REVISION OF THE THEORY OF DREAMS

LADIES AND GENTLEMEN, - If, after an interval of more than fifteen years, I have brought you together again to discuss with you what novelties, and what improvements it may be, the intervening time has introduced into psycho-analysis, it is right and fitting from more than one point of view that we should turn our attention first to the position of the theory of dreams. It occupies a special place in the history of psycho-analysis and marks a turning-point; it was with it that analysis took the step from being a psychotherapeutic procedure to being a depth-psychology. Since then, too, the theory of dreams has remained what is most characteristic and peculiar about the young science, something to which there is no counterpart in the rest of our knowledge, a stretch of new country, which has been reclaimed from popular beliefs and mysticism. The strangeness of the assertions it was obliged to put forward has made it play the part of a shibboleth, the use of which decided who could become a follower of psycho-analysis and to whom it remained forever incomprehensible. I myself found it a sheet-anchor during those difficult times when the unrecognized facts of the neuroses used to confuse my inexperienced judgement. Whenever I began to have doubts of the correctness of my wavering conclusions, the successful transformation of a senseless and muddled dream into a logical and intelligible mental process in the dreamer would renew my confidence of being on the right track.

It is therefore of special interest to us, in the particular instance of the theory of dreams, on the one hand to follow the vicissitudes through which psycho-analysis has passed during this interval, and on the other hand to learn what advances it has made in being understood and appreciated by the contemporary world. I may tell you at once that you will be disappointed in both these directions.

Let us look through the volumes of the *Internationale Zeitschrift für (ärztliche) Psychoanalyse*, in which, since 1913, the authoritative writings in our field of work have been brought together. In the earlier volumes you will find a recurrent sectional heading 'On Dream-Interpretation', containing numerous contributions on various points in the theory of dreams. But the further you go the rarer do these contributions become, and finally the sectional heading disappears completely. The analysts behave as though they had no more to say about dreams, as though there was nothing more to be added to the theory of dreams. But if you ask how much of dream-interpretation has been accepted by outsiders - by the many psychiatrists and psychotherapists who warm their pot of soup at our fire (incidentally without being very grateful for our hospitality), by what are described as educated people, who are in the habit of assimilating the more striking findings of science, by the literary men and by the public at large - the reply gives little cause for satisfaction. A few formulas have become generally familiar, among them some that we have never put forward - such as the thesis that all dreams are of a sexual nature - but really important things like the fundamental distinction between the manifest content of dreams and the latent dream-thoughts, the realization that the wish-fulfilling function of dreams is not contradicted by anxiety-dreams, the impossibility of interpreting a dream unless one has the dreamer's associations to it at one's disposal, and, above all, the discovery that what is essential in dreams is the process of the dream-work - all this still seems about as foreign to general awareness as it was thirty years ago. I am in a position to say this, since in the course of that period I have received innumerable letters whose writers present their dreams for interpretation or ask for information about the nature of dreams and who declare that they have read my *Interpretation of Dreams*, though in every sentence they betray their lack of understanding of our theory of dreams. But all this shall not deter us from once more giving a connected account of what we know about dreams. You will recall that last time we devoted a whole number of lectures to showing how we came to understand this hitherto unexplained mental phenomenon.

Let us suppose, then, that someone - a patient in analysis, for instance - tells us one of his dreams. We shall assume that in this way he is making us one of the communications to which he has pledged himself by the fact of having started an analytic treatment. It is, to be sure, a communication made by inappropriate means, for dreams are not in themselves social utterances, not a means of giving information. Nor, indeed, do we understand what the dreamer was trying to say to us, and he himself is equally in the dark. And now we have to make a quick decision. On the one hand, the dream may be, as non-analytic doctors assure us, a sign that the dreamer has slept badly, that not every part of his brain has come to rest equally, that some areas of it, under the influence of unknown stimuli, endeavoured to go on working but were only able to do so in a very incomplete fashion. If that is the case, we shall be right to concern ourselves no further with the product of a nocturnal disturbance which has no psychical value: for what could we expect to derive from investigating it that would be of use for our purposes? Or on the other hand - but it is plain that we have from the first decided otherwise. We have - quite arbitrarily, it must be admitted - made the assumption, adopted as a postulate, that even this unintelligible dream must be a fully valid psychical act, with sense and worth, which we can use in analysis like any other communication. Only the outcome of our experiment can show whether we are right. If we succeed in turning the dream into an utterance of value of that kind, we shall evidently have a prospect of learning something new and of receiving communications of a sort which would otherwise be inaccessible to us.

Now, however, the difficulties of our task and the enigmas of our subject rise before our eyes. How do we propose to transform the dream into a normal communication and how do we explain the fact that some of the patient's utterances have assumed a form that is unintelligible both to him and to us?

As you see, Ladies and Gentlemen, this time I am taking the path not of a genetic but of a dogmatic exposition. Our first step is to establish our new attitude to the problem of dreams by introducing two new concepts and names. What has been called the dream we shall describe as the text of the dream or the *manifest* dream, and what we are looking for, what we suspect, so to say, of lying behind the dream, we shall describe as the *latent* dream-thoughts. Having done this, we can express our two tasks as follows. We have to transform the manifest dream into the latent one, and to explain how, in the dreamer's mind, the latter has become the former. The first portion is a *practical* task, for which dream-interpretation is responsible; it calls for a technique. The second portion is a *theoretical* task, whose business it is to explain the hypothetical dream-work; and it can only be a theory. Both of them, the technique of dream-interpretation and the theory of the dream-work, have to be newly created.

With which of the two, then, shall we start? With the technique of dream-interpretation, I think; it will present a more concrete appearance and make a more vivid impression on you.

Well then, the patient has told us a dream, which we are to interpret. We have listened passively, without putting our powers of reflection into action. What do we do next? We decide to concern ourselves as little as possible with what we have heard, with the *manifest* dream. Of course this manifest dream exhibits all sorts of characteristics which are not entirely a matter of indifference to us. It may be coherent, smoothly constructed like a literary composition, or it may be confused to the point of unintelligibility, almost like a delirium; it may contain absurd elements or jokes and apparently witty conclusions; it may seem to the dreamer clear and sharp or obscure and hazy; its pictures may exhibit the complete sensory strength of perceptions or may be shadowy like an indistinct mist; the most diverse characteristics may be present in the same dream, distributed over various portions of it; the dream, finally, may show an indifferent emotional tone or be accompanied by feelings of the strongest joy or distress. You must not suppose that we think nothing of this endless diversity in manifest dreams. We shall come back to it later and we shall find a great deal in it that we can make use of in our interpretations. But for the moment we will disregard it and follow the main road that leads to the interpretation of dreams. That is to say, we ask the dreamer, too, to free himself from the impression of the manifest dream, to divert his attention from the dream as a whole on to the separate portions of its content and to report to us in succession everything that occurs to him in relation to each of these portions - what associations present themselves to him if he focuses on each of them separately.

That is a curious technique, is it not? - not the usual way of dealing with a communication or utterance. And no doubt you guess that behind this procedure there are assumptions which have not yet been expressly stated. But let us proceed. In what order are we to get the patient to take up the portions of his dream? There are various possibilities open to us. We can simply follow the chronological order in which they appeared in the account of the dream. That is what may be called the strictest, classical method. Or we can direct the dreamer to begin by looking out for the 'day's residues' in the dream; for experience has taught us that almost every dream includes the remains of a memory or an allusion to some event (or often to several events) of the day before the dream, and, if we follow these connections, we often arrive with one blow at the transition from the apparently far remote dream-world to the real life of the patient. Or, again, we may tell him to start with those elements of the dream's content which strike him by their special clarity and sensory strength; for we know that he will find it particularly easy to get associations to these. It makes no difference by which of these methods we approach the associations we are in search of.

And next, we obtain these associations. What they bring us is of the most various kinds: memories from the day before, the 'dream-day', and from times long past, reflections, discussions, with arguments for and against, confessions and enquiries. Some of them the patient pours out; when he comes to others he is held up for a time. Most of them show a clear connection to some element of the dream; no wonder, since those elements were their starting-point. But it also sometimes happens that the patient introduces them with these words: 'This seems to me to have nothing at all to do with the dream, but I tell it you because it occurs to me.'

If one listens to these copious associations, one soon notices that they have more in common with the content of the dream than their starting-points alone. They throw a surprising light on all the different parts of the dream, fill in gaps between them, and make their strange juxtapositions intelligible. In the end one is bound to become clear about the relation between them and the dream's content. The dream is seen to be an abbreviated selection from the associations, a selection made, it is true, according to rules that we have not yet understood: the elements of the dream are like representatives chosen by election from a mass of people. There can be no doubt that by our technique we have got hold of something for which the dream is a substitute and in which lies the dream's psychical value, but which no longer exhibits its puzzling peculiarities, its strangeness and its confusion.

Let there be no misunderstanding, however. The associations to the dream are not yet the latent dream-thoughts. The latter are contained in the associations like an alkali in the mother liquor, but yet not quite completely contained in them. On the one hand, the associations give us far more than we need for formulating the latent dream-thoughts - namely all the explanations, transitions, and connections which the patient's intellect is bound to produce in the course of his approach to the dream-thoughts. On the other hand, an association often comes to a stop precisely before the genuine dream-thought: it has only come near to it and has only had contact with it through allusions. At that point we intervene on our own; we fill in the hints, draw undeniable conclusions, and give explicit utterance to what the patient has only touched on in his associations. This sounds as though we allowed our ingenuity and caprice to play with the material put at our disposal by the dreamer and as though we misused it in order to interpret *into* his utterances what cannot be interpreted *from* them. Nor is it easy to show the legitimacy of our procedure in an abstract description of it. But you have only to carry out a dream-analysis yourselves or study a good account of one in our literature and you will be convinced of the cogent manner in which interpretative work like this proceeds.

If in general and primarily we are dependent, in interpreting dreams, on the dreamer's associations, yet in relation to certain elements of the dream's content we adopt a quite independent attitude, chiefly because we have to, because as a rule associations fail to materialize in their case. We noticed at an early stage that it is always in connection with the same elements that this happens; they are not very numerous, and repeated experience has taught us that they are to be regarded and interpreted as *symbols* of something else. As contrasted with the other dream-elements, a fixed meaning may be attributed to them, which, however, need not be unambiguous and whose range is determined by special rules with which we are unfamiliar. Since we know how to translate these symbols and the dreamer does not, in spite of having used them himself, it may happen that the sense of a dream may at once become clear to us as soon as we have heard the text of the dream, even before we have made any efforts at interpreting it, while it still remains an enigma to the dreamer himself. But I have said so much to you in my earlier lectures about symbolism, our knowledge of it and the problems it poses us, that I need not repeat it to-day.

That, then, is our method of interpreting dreams. The first and justifiable question is: 'Can we interpret *all* dreams by its help?' And the answer is: 'No, not all; but so many that we feel confident in the serviceability and correctness of the procedure.' 'But why not all?' The answer to this has something important to teach us, which at once introduces us into the psychical determinants of the formation of dreams: 'Because the work of interpreting dreams is carried out against a resistance, which varies between trivial dimensions and invincibility (at least so far as the strength of our present methods reaches).' It is impossible during our work to overlook the manifestations of this resistance. At some points the associations are given without hesitation and the first or second idea that occurs to the patient brings an explanation. At other points there is a stoppage and the patient hesitates before bringing out an association, and, if so, we often have to listen to a long chain of ideas before receiving anything that helps us to understand the dream. We are certainly right in thinking that the longer and more roundabout the chain of associations the stronger the resistance. We can detect the same influence at work in the forgetting of dreams. It happens often enough that a patient, despite all his efforts, cannot remember one of his dreams. But after we have been able in the course of a piece of analytic work to get rid of a difficulty which had been disturbing his relation to the analysis, the forgotten dream suddenly re-emerges. Two other observations are also in place here. It very frequently comes about that, to begin with, a portion of a dream is omitted and added afterwards as an addendum. This is to be regarded as an attempt to forget that portion. Experience shows that it is that particular piece which is the most important; there was a greater resistance, we suppose, in the path of communicating it than the other parts of the dream. Furthermore, we often find that a dreamer endeavours to prevent himself from forgetting his dreams by fixing them in writing immediately after waking up. We can tell him that that is no use. For the resistance from which he has extorted the preservation of the text of the dream will then be displaced on to its associations and will make the manifest dream inaccessible to interpretation. In view of these facts we need not feel surprised if a further increase in the resistance suppresses the associations altogether and thus brings the interpretation of the dream to nothing.

From all this we infer that the resistance which we come across in the work of interpreting dreams must also have had a share in their origin. We can actually distinguish between dreams that arose under a slight and under a high pressure of resistance. But this pressure varies as well from place to place within one and the same dream; it is responsible for the gaps, obscurities and confusions which may interrupt the continuity of even the finest of dreams.

But what is creating the resistance and against what is it aimed? Well, the resistance is the surest sign to us of a conflict. There must be a force here which is seeking to express something and another which is striving to prevent its expression. What comes about in consequence as a manifest dream may combine all the decisions into which this struggle between two trends has been condensed. At one point one of these forces may have succeeded in putting through what it wanted to say, while at another point it is the opposing agency which has managed to blot out the intended communication completely or to replace it by something that reveals not a trace of it. The commonest and most characteristic cases of dream-construction are those in which the conflict has ended in a compromise, so that the communicating agency has, it is true, been able to say what it wanted but not in the way it wanted - only in a softened down, distorted and unrecognized form. If, then, dreams do not give a faithful picture of the dream-thoughts and if the work of interpretation is required in order to bridge the gap between them, that is the outcome of the opposing, inhibiting and restricting agency which we have inferred from our perception of the resistance while we interpret dreams. So long as we studied dreams as isolated phenomena independent of the psychical structures akin to them, we named this agency the *censor of dreams*.

You have long been aware that this censorship is not an institution peculiar to dream-life. You know that the conflict between the two psychical agencies, which we - inaccurately - describe as the 'unconscious repressed' and the 'conscious', dominates our whole mental life and that the resistance against the interpretation of dreams, the sign of the dream-censorship, is nothing other than the resistance due to repression by which the two agencies are separated. You know too that the conflict between these two agencies may under certain conditions produce other psychical structures which, like dreams, are the outcome of compromises; and you will not expect me to repeat to you here everything that was contained in my introduction to the theory of the neuroses in order to demonstrate to you what we know of the determinants of the formation of such compromises. You have realized that the dream is a pathological product, the first member of the class which includes hysterical symptoms, obsessions and delusions, but that it is distinguished from the others by its transitoriness and by its occurrence under conditions which are part of normal life. For let us bear firmly in mind that, as was already pointed out by Aristotle, dream life is the way in which our mind works during the state of sleep. The state of sleep involves a turning-away from the real external world, and there we have the necessary condition for the development of a psychosis. The most careful study of the severe psychoses will not reveal to us a single feature that is more characteristic of those pathological conditions. In psychoses, however, the turning-away from reality is brought about in two kinds of way: either by the unconscious repressed becoming excessively strong so that it overwhelms the conscious, which is attached to reality, or because reality has become so intolerably distressing that the threatened ego throws itself into the arms of the unconscious instinctual forces in a desperate revolt. The harmless dream-psychosis is the result of a withdrawal from the external world which is consciously willed and only temporary, and it disappears when relations to the external world are resumed. During the isolation of the sleeping individual an alteration in the distribution of his psychical energy also sets in; a part of the expenditure on repression, which is normally required in order to hold the unconscious down, can be saved, for if the unconscious makes use of its relative liberation for active purposes, it finds its path to motility closed and the only path open to it is the harmless one leading to hallucinatory satisfaction. Now, therefore, a dream can be formed; but the fact of the dream-censorship shows that even during sleep enough of the resistance due to repression is retained.

Here we are presented with a means of answering the question of whether dreams have a function too, whether they are entrusted with any useful achievement. The condition of rest free from stimulus, which the state of sleep wishes to establish, is threatened from three directions: in a relatively accidental manner by external stimuli during sleep, and by interests of the previous day which cannot be broken off, and in an unavoidable manner by unsated repressed instinctual impulses which are on the watch for an opportunity of finding expression. In consequence of the diminishing of repressions at night there would be a risk that the rest afforded by sleep would be interrupted whenever an instigation from outside or from inside succeeded in linking up with an unconscious instinctual source. The process of dreaming allows the product of a collaboration of this kind to find an outlet in a harmless hallucinatory experience and in that way assures a continuation of sleep. The fact that a dream occasionally awakens the sleeper, to the accompaniment of a generation of anxiety, is no contradiction of this function but rather, perhaps, a signal that the watchman regards the situation as too dangerous and no longer feels able to control it. And very often then, while we are still asleep, a consolation occurs to us which seeks to prevent our waking up: 'But after all it's only a dream!'

This was what I wanted to say to you, Ladies and Gentlemen, about dream-interpretation, whose task it is to lead the way from the manifest dream to the latent dream-thoughts. When this has been achieved, interest in a dream, so far as practical analysis is concerned, is for the most part at an end. We add the communication we have received in the form of a dream to the rest of the patient's communications and proceed with the analysis. We, however, have an interest in dwelling a little longer on the dream. We are tempted to study the process by which the latent dream-thoughts were transformed into the manifest dream. We call this the 'dream-work'. As you will recall, I described it in such detail in my earlier lectures that I can restrict my present survey to the most concise summary.

The process of the dream-work, then, is something entirely new and strange, nothing resembling which was known before. It has given us our first glimpse of the processes which take place in the unconscious system and has shown us that they are quite other than what we know from our conscious thinking and are bound to appear to the latter preposterous and incorrect. The importance of this finding was then increased by the discovery that in the construction of neurotic symptoms the same mechanisms (we do not venture to say 'processes of thought') are operative as those which have transformed the latent dream-thoughts into the manifest dream.

In what follows I shall not be able to avoid a schematic method of exposition. Let us assume that in a particular case we have before us all the latent thoughts, charged with a greater or less amount of affect, by which the manifest dream has been replaced after its interpretation has been completed. We shall then be struck by one difference among these latent thoughts, and that difference will take us a long way. Almost all these dream-thoughts are recognized by the dreamer or acknowledged by him; he admits that he has thought this, now or at some other time, or that he might have thought it. There is only one single thought that he refuses to accept; it is strange to him or even perhaps repellent; he may possibly reject it with passionate feeling. It now becomes evident to us that the other thoughts are portions of a conscious, or, more accurately, a preconscious train of thinking. They might have been thought in waking life too, and indeed they were probably formed during the previous day. This one repudiated thought, however, or, properly speaking, this one impulse, is a child of night; it belongs to the dreamer's unconscious and on that account it is repudiated and rejected by him. It had to wait for the nightly relaxation of repression in order to arrive at any kind of expression. And in any case this expression is a weakened, distorted and disguised one; without our work of dream-interpretation we should not have found it. This unconscious impulse has to thank its link with the other, unobjectionable, dream-thoughts for the opportunity of slipping past the barrier of the censorship in an inconspicuous disguise. On the other hand, the preconscious dream-thoughts have to thank this same link for the power to occupy mental life during sleep as well. For there is no doubt about it: this unconscious impulse is the true creator of the dream; it is what produces the psychical energy for the dream's construction. Like any other instinctual impulse, it cannot strive for anything other than its own satisfaction; and our experience in interpreting dreams shows us too that that is the sense of all dreaming. In every dream an instinctual wish has to be represented as fulfilled. The shutting-off of mental life from reality at night and the regression to primitive mechanisms which this makes possible enable this wished-for instinctual satisfaction to be experienced in a hallucinatory manner as occurring in the present. As a result of this same regression, ideas are transformed in the dream into visual pictures: the latent dream-thoughts, that is to say, are dramatized and illustrated.

This piece of the dream-work gives us information about some of the most striking and peculiar features of dreams. I will repeat the course of events in dream-formation. As an introduction: the wish to sleep and intentional turning away from the external world. Next, two consequences of this for the mental apparatus: first, the possibility for older and more primitive methods of working to emerge in it - regression; secondly, the lowering of the resistance due to repression which weighs down upon the unconscious. As a result of this last factor the possibility arises for the formation of a dream and this is taken advantage of by the precipitating causes, the internal and external stimuli which have become active. The dream which originates in this way is already a compromise-structure. It has a double function; on the one hand it is ego-syntonic, since, by getting rid of the stimuli which are interfering with sleep, it serves the wish to sleep; on the other hand it allows a repressed instinctual impulse to obtain the satisfaction that is possible in these circumstances, in the form of the hallucinated fulfilment of a wish. The whole process of forming a dream which is permitted by the sleeping ego is, however, subject to the condition of the censorship, which is exercised by the residue of the repression still in operation. I cannot present the process more simply: it is not more simple. But I can proceed now with my description of the dream-work.

Let us go back once more to the latent dream-thoughts. Their most powerful element is the repressed instinctual impulse which has created in them an expression for itself on the basis of the presence of chance stimuli and by transference on to the day's residues - though an expression that is toned down and disguised. Like every instinctual impulse, it too presses for satisfaction by action; but its path to motility is blocked by the physiological regulations implied in the state of sleep; it is compelled to take the backwards course in the direction of perception and to be content with a hallucinated satisfaction. The latent dream-thoughts are thus transformed into a collection of sensory images and visual scenes. It is as they travel on this course that what seems to us so novel and so strange occurs to them. All the linguistic instruments by which we express the subtler relations of thought - the conjunctions and prepositions, the changes in declension and conjugation - are dropped, because there are no means of representing them; just as in a primitive language without any grammar, only the raw material of thought is expressed and abstract terms are taken back to the concrete ones that are at their basis. What is left over after this may well appear disconnected. The copious employment of symbols, which have become alien to conscious thinking, for representing certain objects and processes is in harmony alike with the archaic regression in the mental apparatus and with the demands of the censorship.

But other changes made in the elements of the dream-thoughts go far beyond this. Such of those elements as allow any point of contact to be found between them are *condensed* into new unities. In the process of transforming the thoughts into pictures, preference is unmistakably given to such as permit of this putting-together, this condensation; it is as though a force were at work which was subjecting the material to compression and concentration. As a result of condensation, one element in the manifest dream may correspond to numerous elements in the latent dream-thoughts; but, conversely too, one element in the dream-thoughts may be represented by several images in the dream.

Still more remarkable is the other process - *displacement* or shifting of accent - which in conscious thinking we come across only as faulty reasoning or as means for a joke. The different ideas in the dream-thoughts are, indeed, not all of equal value; they are cathected with quotas of affect of varying magnitude and are correspondingly judged to be important and deserving of interest to a greater or less degree. In the dream-work these ideas are separated from the affects attaching to them. The affects are dealt with independently; they may be displaced on to something else, they may be retained, they may undergo alterations, or they may not appear in the dream at all. The importance of the ideas that have been stripped of their affect returns in the dream as sensory strength in the dream-pictures; but we observe that this accent has passed over from important elements to indifferent ones. Thus something that played only a minor part in the dream-thoughts seems to be pushed into the foreground in the dream as the main thing, while, on the contrary, what was the essence of the dream-thoughts finds only passing and indistinct representation in the dream. No other part of the dream-work is so much responsible for making the dream strange and incomprehensible to the dreamer. Displacement is the principal means used in the *dream-distortion* to which the dream-thoughts must submit under the influence of the censorship.

After these influences have been brought to bear upon the dream-thoughts the dream is almost complete. A further, somewhat variable, factor also comes into play - known as 'secondary revision' - after the dream has been presented before consciousness as an object of perception. At that point we treat it as we are in general accustomed to treat the contents of our perception: we fill in gaps and introduce connections, and in doing so are often guilty of gross misunderstandings. But this activity, which might be described as a rationalizing one and which at best provides the dream with a smooth façade that cannot fit its true content, may also be omitted or only be expressed to a very modest degree - in which case the dream will display all its rents and cracks openly. It must not be forgotten, on the other hand, that the dream-work does not always operate with equal energy either; it often restricts itself to certain portions of the dream-thoughts only and others of them are allowed to appear in the dream unaltered. In such cases an impression is given of the dream having carried out the most delicate and complex intellectual operations, of its having speculated, made jokes, arrived at decisions and solved problems, whereas all this is a product of our normal mental activity, may have been performed equally well during the day before the dream as during the night, has nothing to do with the dream-work and brings nothing to light that is characteristic of dreams. Nor is it superfluous to insist once more on the contrast within the dream-thoughts themselves between the unconscious instinctual impulse and the day's residues. While the latter exhibit all the multiplicity of our mental acts, the former, which becomes the motive force proper of the forming of the dream, finds its outlet invariably in the fulfilment of a wish.

I could have told you all this fifteen years ago, and indeed I believe I did in fact tell it you then. And now let me bring together such changes and new discoveries as may have been made during the interval. I have said already that I am afraid you will find that it amounts to very little, and you will fail to understand why I obliged you to listen to the same thing twice over, and obliged myself to say it. But fifteen years have passed meanwhile and I hope that this will be my easiest way of re-establishing contact with you. Moreover, these are such fundamental things, of such decisive importance for understanding psycho-analysis, that one may be glad to hear them a second time, and it is in itself worth knowing that they have remained so much the same for fifteen years.

In the literature of this period you will of course find a large quantity of confirmatory material and of presentation of details, of which I intend only to give you samples. I shall also, incidentally, be able to tell you a few things that were in fact already known earlier. What is in question is principally the symbolism in dreams and the other methods of representation in them. Now listen to this. Only quite a short while ago the medical faculty in an American University refused to allow psycho-analysis the status of a science, on the ground that it did not admit of any experimental proof. They might have raised the same objection to astronomy; indeed, experimentation with the heavenly bodies is particularly difficult. There one has to fall back on observation. Nevertheless, some Viennese investigators have actually made a beginning with experimental confirmation of our dream symbolism. As long ago as in 1912 a Dr. Schrötter found that if instructions to dream of sexual matters are given to deeply hypnotized subjects, then in the dream that is thus provoked the sexual material emerges with its place taken by the symbols that are familiar to us. For instance, a woman was told to dream of sexual intercourse with a female friend. In her dream this friend appeared with a travelling-bag on which was pasted the label 'Ladies Only'. Still more impressive experiments were carried out by Betlheim and Hartmann in 1924. They worked with patients suffering from what is known as the Korsakoff confusional psychosis. They told these patients stories of a grossly sexual kind and observed the distortions which appeared when the patients were instructed to reproduce what they had been told. Once more there emerged the symbols for sexual organs and sexual intercourse that are familiar to us - among them the symbol of the staircase which, as the writers justly remark, could never have been reached by a conscious wish to distort.

In a very interesting series of experiments, Herbert Silberer has shown that one can catch the dream-work red-handed, as it were, in the act of turning abstract thoughts into visual pictures. If he tried to force himself to do intellectual work while he was in a state of fatigue and drowsiness, the thought would often vanish and be replaced by a vision, which was obviously a substitute for it.

Here is a simple example. 'I thought', says Silberer, 'of having to revise an uneven passage in an essay.' The vision: 'I saw myself planing a piece of wood.' It often happened during these experiments that the content of the vision was not the thought that was being dealt with but his own subjective state while he was making the effort - the state instead of the object. This is described by Silberer as a 'functional phenomenon'. An example will show you at once what is meant. The author was endeavouring to compare the opinions of two philosophers on a particular question. But in his sleepy condition one of these opinions kept on escaping him and finally he had a vision that he was asking for information from a disobliging secretary who was bent over his writing-table and who began by disregarding him and then gave him a disagreeable and uncomplying look. The conditions under which the experiments were made probably themselves explain why the vision that was induced represented so often an event of self-observation.

We have not yet finished with symbols. There are some which we believed we recognized but which nevertheless worried us because we could not explain how *this* particular symbol had come to have *that* particular meaning. In such cases confirmations from elsewhere - from philology, folklore, mythology or ritual - were bound to be especially welcome. An instance of this sort is the symbol of an overcoat or cloak. We have said that in a woman's dreams this stands for a man. I hope it will impress you when you hear that Theodor Reik (1920) gives us this information: 'During the extremely ancient bridal ceremonial of the Bedouins, the bridegroom covers the bride with a special cloak known as "Aba" and speaks the following ritual words: "Henceforth none save I shall cover thee!" (Quoted from Robert Eisler). We have also found several fresh symbols, at least two of which I will tell you of. According to Abraham (1922) a spider in dreams is a symbol of the mother, but of the *phallic* mother, of whom we are afraid; so that the fear of spiders expresses dread of mother-incest and horror of the female genitals. You know, perhaps, that the mythological creation, Medusa's head, can be traced back to the same *motif* of fright at castration. The other symbol I want to talk to you about is that of the *bridge*, which has been explained by Ferenczi (1921 and 1922). First it means the male organ, which unites the two parents in sexual intercourse; but afterwards it develops further meanings which are derived from this first one. In so far as it is thanks to the male organ that we are able to come into the world at all, out of the amniotic fluid, a bridge becomes the crossing from the other world (the unborn state, the womb) to this world (life); and, since men also picture death as a return to the womb (to the water), a bridge also acquires the meaning of something that leads to death, and finally, at a further remove from its original sense, it stands for transitions or changes in condition generally. It tallies with this, accordingly, if a woman who has not overcome her wish to be a man has frequent dreams of bridges that are too short to reach the further shore.

In the manifest content of dreams we very often find pictures and situations recalling familiar themes in fairy tales, legends and myths. The interpretation of such dreams thus throws a light on the original interests which created these themes, though we must at the same time not forget, of course, the change in meaning by which this material has been affected in the course of time. Our work of interpretation uncovers, so to say, the raw material, which must often enough be described as sexual in the widest sense, but has found the most varied application in later adaptations. Derivations of this kind are apt to bring down on us the wrath of all non-analytically schooled workers, as though we were seeking to deny or undervalue everything that was later erected on the original basis. Nevertheless, such discoveries are instructive and interesting. The same is true of tracing back the origin of particular themes in plastic art, as, for instance, when M. J. Eisler (1919), following indications in his patients' dreams, gave an analytic interpretation of the youth playing with a little boy represented in the Hermes of Praxiteles. And lastly I cannot resist pointing out how often light is thrown by the interpretation of dreams on mythological themes in particular. Thus, for instance, the legend of the Labyrinth can be recognized as a representation of anal birth: the twisting paths are the bowels and Ariadne's thread is the umbilical cord.

The methods of representation employed by the dream-work - fascinating material, scarcely capable of exhaustion - have been made more and more familiar to us by closer study. I will give you a few examples of them. Thus, for instance, dreams represent the relation of frequency by a multiplication of similar things. Here is a young girl's remarkable dream. She dreamt she came into a great hall and found some one in it sitting on a chair; this was repeated six or eight times or more, but each time it was her father. This is easy to understand when we discover, from accessory details in the interpretation, that this room stood for the womb. The dream then becomes equivalent to the phantasy, familiarly found in girls, of having met their father already during their intra-uterine life when he visited the womb while their mother was pregnant. You should not be confused by the fact that something is reversed in the dream - that her father's 'coming-in' is displaced on to herself; incidentally, this has a special meaning of its own as well. The multiplication of the figure of the father can only express the fact that the event in question occurred repeatedly. After all, it must be allowed that the dream is not taking very much on itself in expressing frequency by multiplicity. It has only needed to go back to the original significance of the former word; to-day it means to us a repetition in time, but it is derived from an accumulation in space. In general, indeed, where it is possible, the dream-work changes temporal relations into spatial ones and represents them as such. In a dream, for instance, one may see a scene between two people who look very small and a long way off, as though one were seeing them through the wrong end of a pair of opera-glasses. Here, both the smallness and the remoteness in space have the same significance: what is meant is remoteness in *time* and we are to understand that the scene is from the remote past.

Again, you may remember that in my earlier lectures I already told you (and illustrated the fact by examples) that we had learnt to make use for our interpretations even of the purely *formal* features of the manifest dream - that is, to transform them into material coming from the latent dream-thoughts. As you already know, all dreams that are dreamt in a single night belong in a single context. But it is not a matter of indifference whether these dreams appear to the dreamer as a continuum or whether he divides them into several parts and into how many. The number of such parts often corresponds to an equal number of separate focal points in the structural formation of the latent dream-thoughts or to contending trends in the dreamer's mental life, each of which finds a dominant, even though never an exclusive, expression in one particular part of the dream. A short introductory dream and a longer main dream following it often stand in the relation of protasis and apodosis, of which a very clear instance will be found in the old lectures. A dream which is described by the dreamer as 'somehow interpolated' will actually correspond to a dependent clause in the dream-thoughts. Franz Alexander (1925) has shown in a study on pairs of dreams that it not infrequently happens that two dreams in one night share the carrying-out of the dream's task by producing a wish-fulfilment in two stages if they are taken together, though each dream separately would not effect that result. Suppose, for instance, that the dream-wish had as its content some illicit action in regard to a particular person. Then in the first dream the person will appear undisguised, but the action will be only timidly hinted at. The second dream will behave differently. The action will be named without disguise, but the person will either be made unrecognizable or replaced by someone indifferent. This, you will admit, gives one an impression of actual cunning. Another and similar relation between the two members of a pair of dreams is found where one represents a punishment and the other the sinful wish-fulfilment. It amounts to this: 'if one accepts the punishment for it, one can go on to allow oneself the forbidden thing.'

I cannot detain you any longer over such minor discoveries or over the discussions relating to the employment of dream-interpretation in the work of analysis. I feel sure you are impatient to hear what changes have been made in our fundamental views on the nature and significance of dreams. I have already warned you that precisely on this there is little to report to you. The most disputed point in the whole theory was no doubt the assertion that all dreams are the fulfilments of wishes. The inevitable and ever recurring objection raised by the layman that there are nevertheless so many anxiety-dreams was, I think I may say, completely disposed of in my earlier lectures. With the division into wishful dreams, anxiety-dreams and punishment dreams, we have kept our theory intact.

Punishment-dreams, too, are fulfilments of wishes, though not of wishes of the instinctual impulses but of those of the critical, censoring and punishing agency in the mind. If we have a pure punishment-dream before us, an easy mental operation will enable us to restore the wishful dream to which the punishment-dream was the correct rejoinder and which, owing to this repudiation, was replaced as the manifest dream. As you know, Ladies and Gentlemen, the study of dreams was what first helped us to understand the neuroses, and you will find it natural that our knowledge of the neuroses was later able to influence our view of dreams. As you will hear, we have been obliged to postulate the existence in the mind of a special critical and prohibiting agency which we have named the 'super-ego'. Since recognizing that the censorship of dreams is also a function of this agency, we have been led to examine the part played by the super-ego in the construction of dreams more carefully.

Only two serious difficulties have arisen against the wish-fulfilment theory of dreams. A discussion of them leads far afield and has not yet, indeed, brought us to any wholly satisfying conclusion.

The first of these difficulties is presented in the fact that people who have experienced a shock, a severe psychological trauma - such as happened so often during the war and such as affords the basis for traumatic hysteria - are regularly taken back in their dreams into the traumatic situation. According to our hypotheses about the function of dreams this should not occur. What wishful impulse could be satisfied by harking back in this way to this exceedingly distressing traumatic experience? It is hard to guess.

We meet with the second of these facts almost every day in the course of our analytic work; and it does not imply such an important objection as the other does. One of the tasks of psycho-analysis, as you know, is to lift the veil of amnesia which hides the earliest years of childhood and to bring to conscious memory the manifestations of early infantile sexual life which are contained in them. Now these first sexual experiences of a child are linked to painful impressions of anxiety, prohibition, disappointment and punishment. We can understand their having been repressed; but, that being so, we cannot understand how it is that they have such free access to dream-life, that they provide the pattern for so many dream-phantasies and that dreams are filled with reproductions of these scenes from childhood and with allusions to them. It must be admitted that their unpleasurable character and the dream-work's wish-fulfilling purpose seem far from mutually compatible. But it may be that in this case we are magnifying the difficulty. After all, these same infantile experiences have attached to them all the imperishable, unfulfilled instinctual wishes which throughout life provide the energy for the construction of dreams, and to which we may no doubt credit the possibility, in their mighty uprush, of forcing to the surface, along with the rest, the material of distressing events. And on the other hand the manner and form in which this material is reproduced shows unmistakably the efforts of the dream-work directed to denying the unpleasure by means of distortion and to transforming disappointment into attainment.

With the traumatic neuroses things are different. In their case the dreams regularly end in the generation of anxiety. We should not, I think, be afraid to admit that here the function of the dream has failed. I will not invoke the saying that the exception proves the rule: its wisdom seems to me most questionable. But no doubt the exception does not overturn the rule. If, for the sake of studying it, we isolate one particular psychical function, such as dreaming, from the psychical machinery as a whole, we make it possible to discover the laws that are peculiar to it; but when we insert it once more into the general context we must be prepared to discover that these findings are obscured or impaired by collision with other forces. We say that a dream is the fulfilment of a wish; but if you want to take these latter objections into account, you can say nevertheless that a dream is an *attempt* at the fulfilment of a wish. No one who can properly appreciate the dynamics of the mind will suppose that you have said anything different by this. In certain circumstances a dream is only able to put its intention into effect very incompletely, or must abandon it entirely. Unconscious fixation to a trauma seems to be foremost among these obstacles to the function of dreaming. While the sleeper is obliged to dream, because the relaxation of repression at night allows the upward pressure of the traumatic fixation to become active, there is a failure in the functioning of his dream-work, which would like to transform the memory-traces of the traumatic event into the fulfilment of a wish. In these circumstances it will happen that one cannot sleep, that one gives up sleep from dread of the failure of the function of dreaming. Traumatic neuroses are here offering us an extreme case; but we must admit that childhood experiences, too, are of a traumatic nature, and we need not be surprised if comparatively trivial interferences with the function of dreams may arise under other conditions as well.

LECTURE XXX

DREAMS AND OCCULTISM

LADIES AND GENTLEMEN, - To-day we will proceed along a narrow path, but one which may lead us to a wide prospect.

You will scarcely be surprised by the news that I am going to speak to you on the relation of dreams to occultism. Dreams have, indeed, often been regarded as the gateway into the world of mysticism, and even to-day are themselves looked on by many people as an occult phenomenon. Even we, who have made them into a subject for scientific study, do not dispute that one or more threads link them to those obscure matters. Mysticism, occultism - what is meant by these words? You must not expect me to make any attempt at embracing this ill-circumscribed region with definitions. We all know in a general and indefinite manner what the words imply to us. They refer to some sort of 'other world', lying beyond the bright world governed by relentless laws which has been constructed for us by science.

Occultism asserts that there are in fact 'more things in heaven and earth than are dreamt of in our philosophy'. Well, we need not feel bound by the narrow-mindedness of academic philosophy; we are ready to believe what is shown to us to deserve belief.

We propose to proceed with these things as we do with any other scientific material: first of all to establish whether such events can really be shown to occur, and then and only then, when their factual nature cannot be doubted, to concern ourselves with their explanation. It cannot be denied, however, that even the putting of this decision into action is made hard for us by intellectual, psychological and historical factors. The case is not the same as when we approach other investigations.

First, the intellectual difficulty. Let me give you a crude and obvious explanation of what I have in mind. Let us suppose that the question at issue is the constitution of the interior of the earth. We have, as you are aware, no certain knowledge about it. We suspect that it consists of heavy metals in an incandescent state. Then let us imagine that someone puts forward an assertion that the interior of the earth consists of water saturated with carbonic acid - that is to say, with a kind of soda-water. We shall no doubt say that this is most improbable, that it contradicts all our expectations and pays no attention to the known facts which have led us to adopt the metal hypothesis. Nevertheless it is not inconceivable; if someone were to show us a way of testing the soda-water hypothesis we should follow it without objecting. But suppose now that someone else comes along and seriously asserts that the core of the earth consists of jam. Our reaction to this will be quite different. We shall tell ourselves that jam does not occur in nature, that it is a product of human cooking, that, moreover, the existence of this material presupposes the presence of fruit-trees and their fruit, and that we cannot see how we can locate vegetation and human cookery in the interior of the earth. The result of these intellectual objections will be a switching of our interest: instead of starting upon an investigation of whether the core of the earth really consists of jam, we shall ask ourselves what sort of person this must be who can arrive at such a notion, or at most we shall ask him where he got it from. The unlucky inventor of the jam theory will be very much insulted and will complain that we are refusing to make an objective investigation of his assertion on the ground of a pretendedly scientific prejudice. But this will be of no help to him. We perceive that prejudices are not always to be reprobated, but that they are sometimes justified and expedient because they save us useless labour. In fact they are only conclusions based on an analogy with other well-founded judgements.

A whole number of occultist assertions have the same sort of effect on us as the jam hypothesis; so that we consider ourselves justified in rejecting them at sight, without further investigation. But all the same, the position is not so simple. A comparison like the one I have chosen proves nothing, or proves as little as comparisons in general. It remains doubtful whether it fits the case, and it is clear that its choice was already determined by our attitude of contemptuous rejection. Prejudices are sometimes expedient and justified; but sometimes they are erroneous and detrimental, and one can never tell when they are the one and when the other. The history of science itself abounds in instances which are a warning against premature condemnation. For a long time it was regarded as a senseless hypothesis to suppose that the stones, which we now call meteorites, could have reached the earth from outer space or that the rocks forming mountains, in which the remains of shells are imbedded, could have once formed the bed of the sea. Incidentally, much the same thing happened to our psycho-analysis when it brought forward its inference of there being an unconscious. Thus we analysts have special reason to be careful in using intellectual considerations for rejecting new hypotheses and must admit that they do not relieve us from feelings of antipathy, doubt and uncertainty.

I have spoken of the second factor as the psychological one. By that I mean the general tendency of mankind to credulity and a belief in the miraculous. From the very beginning, when life takes us under its strict discipline, a resistance stirs within us against the relentlessness and monotony of the laws of thought and against the demands of reality-testing. Reason becomes the enemy which withholds from us so many possibilities of pleasure. We discover how much pleasure it gives us to withdraw from it, temporarily at least, and to surrender to the allurements of nonsense. Schoolboys delight in the twisting of words; when a scientific congress is over, the specialists make fun of their own activities; even earnest-minded men enjoy a joke. More serious hostility to 'Reason and Science, the highest strength possessed by man', awaits its opportunity; it hastens to prefer the miracle-doctor or the practitioner of nature-cures to the 'qualified' physician; it is favourable to the assertions of occultism so long as those alleged facts can be taken as breaches of laws and rules; it lulls criticism to sleep, falsifies perceptions and enforces confirmations and agreements which cannot be justified. If this human tendency is taken into account, there is every reason to discount much of the information put forward in occultist literature.

I have called the third doubt the historical one; and by it I mean to point out that there is in fact nothing new in the world of occultism. There emerge in it once more all the signs, miracles, prophecies and apparitions which have been reported to us from ancient times and in ancient books and which we thought had long since been disposed of as the offspring of unbridled imagination or of tendentious fraud, as the product of an age in which man's ignorance was very great and the scientific spirit was still in its cradle. If we accept the truth of what, according to the occultists' information, still occurs to-day, we must also believe in the authenticity of the reports which have come down to us from ancient times. And we must then reflect that the tradition and sacred books of all peoples are brimful of similar marvellous tales and that the religions base their claim to credibility on precisely such miraculous events and find proof in them of the operation of superhuman powers. That being so, it will be hard for us to avoid a suspicion that the interest in occultism is in fact a religious one and that one of the secret motives of the occultist movement is to come to the help of religion, threatened as it is by the advance of scientific thought. And with the discovery of this motive our distrust must increase and our disinclination to embark on the examination of these supposedly occult phenomena.

Sooner or later, however, this disinclination must be overcome. We are faced by a question of fact: is what the occultists tell us true or not? It must, after all, be possible to decide this by observation. At bottom we have cause for gratitude to the occultists. The miraculous stories from ancient times are beyond the reach of our testing. If in our opinion they cannot be substantiated, we must admit that they cannot, strictly speaking, be disproved. But about contemporary happenings, at which we are able to be present, it must be possible for us to reach a definite judgement. If we arrive at a conviction that such miracles do not occur to-day, we need not fear the counter-argument that they may nevertheless have taken place in ancient times: in that case other explanations will be much more plausible. Thus we have settled our doubts and are ready to take part in an investigation of occult phenomena.

But here unluckily we are met by circumstances which are exceedingly unfavourable to our honest intentions. The observations on which our judgement is supposed to depend take place under conditions which make our sensory perceptions uncertain and which blunt our power of attention; they occur in darkness or in dimmed light after long periods of blank expectation. We are told that in fact our unbelieving - that is to say, critical - attitude may prevent the expected phenomena from happening. The situation thus brought about is nothing less than a caricature of the circumstances in which we are usually accustomed to carry out scientific enquiries. The observations are made upon what are called 'mediums' - individuals to whom peculiarly 'sensitive' faculties are ascribed, but who are by no means distinguished by outstanding qualities of intellect or character and who are not, like the miracle-workers of the past, inspired by any great idea or serious purpose. On the contrary, they are looked upon, even by those who believe in their secret powers, as particularly untrustworthy; most of them have already been detected as cheats and we may reasonably expect that the same fate awaits the remainder. Their performances give one the impression of children's mischievous pranks or of conjuring tricks. Never has anything of importance yet emerged from *séances* with these mediums - the revelation of a new source of power, for instance. We do not, it is true, expect to receive hints on pigeon-breeding from the conjurer who produces pigeons by magic from his empty top-hat. I can easily put myself in the place of a person who tries to fulfil the demands of an objective attitude and so takes part in occult *séances*, but who grows tired after a while and turns away in disgust from what is expected of him and goes back unenlightened to his former prejudices. The reproach may be made against such a person that this is not the right way of behaving: that one ought not to lay down in advance what the phenomena one is seeking to study shall be like and in what circumstances they shall appear. One should, on the contrary, persevere, and give weight to the precautionary and supervisory measures by which efforts have recently been made to provide against the untrustworthiness of mediums. Unfortunately this modern protective technique makes an end of the easy accessibility of occult observations. The study of occultism becomes a specialized and difficult profession - an activity one cannot pursue alongside of one's other interests. And until those concerned in these investigations have reached their conclusions, we are left to our doubts and our own conjectures.

Of these conjectures no doubt the most probable is that there is a real core of yet unrecognized facts in occultism round which cheating and phantasy have spun a veil which it is hard to pierce. But how can we even approach this core? at what point can we attack the problem? It is here, I think, that dreams come to our help, by giving us a hint that from out of this chaos we should pick the subject of *telepathy*.

What we call 'telepathy' is, as you know, the alleged fact that an event which occurs at a particular time comes at about the same moment to the consciousness of someone distant in space, without the paths of communication that are familiar to us coming into question. It is implicitly presupposed that this event concerns a person in whom the other one (the receiver of the intelligence) has a strong emotional interest. For instance, Person A may be the victim of an accident or may die, and Person B, someone nearly attached to him - his mother or daughter or fiancée - learns the fact at about the same time through a visual or auditory perception. In this latter case, then, it is as if she had been informed by telephone, though such was not the case; it is a kind of psychical counterpart to wireless telegraphy. I need not insist to you on the improbability of such events, and there is good reason for dismissing the majority of such reports. A few are left over which cannot be so easily disposed of in this way. Permit me now, for the purpose of what I have to tell you, to omit the cautious little word 'alleged' and to proceed as though I believed in the objective reality of the phenomenon of telepathy. But bear firmly in mind that that is not the case and that I have committed myself to no conviction.

Actually I have little to tell you - only a modest fact. I will also at once reduce your expectations still further by saying that at bottom dreams have little to do with telepathy. Telepathy does not throw any fresh light on the nature of dreams nor do dreams give any direct evidence of the reality of telepathy. Moreover the phenomenon of telepathy is by no means bound up with dreams; it can occur as well during the waking state. The only reason for discussing the relation between dreams and telepathy is that the state of sleep seems particularly suited for receiving telepathic messages. In such cases one has what is called a telepathic dream and, when it is analysed, one forms a conviction that the telepathic news has played the same part as any other portion of the day's residues and that it has been changed in the same way by the dream-work and made to serve its purpose.

During the analysis of one such telepathic dream, something occurred which seems to me of sufficient interest in spite of its triviality to serve as the starting-point of this lecture. When in 1922 I gave my first account of this matter I had only a single observation at my disposal. Since then I have made a number of similar ones, but I will keep to the first example, because it is easiest to describe, and I will take you straight away *in medias res*.

An obviously intelligent man, who from his own account was not in the least 'inclined towards occultism', wrote to me about a dream he had had which seemed to him remarkable. He began by informing me that his married daughter, who lived at a distance from him, was expecting her first confinement in the middle of December. This daughter meant a great deal to him and he knew too that she was very much attached to him. During the night of November 16-17, then, he dreamt that his wife had given birth to twins. A number of details followed, which I may here pass over, and all of which were never in fact explained. The wife who in the dream had become the mother of twins was his *second* wife, his daughter's stepmother. He did not wish to have a child by his present wife who, he said, had no aptitude for bringing up children sensibly; moreover, at the time of the dream he had long ceased to have sexual relations with her. What led him to write to me was not doubt about the theory of dreams, though the manifest content of his dream would have justified it, for why did the dream, in complete contradiction to his wishes, make his wife give birth to children? Nor, according to him, was there any reason to fear that this unwished-for event might occur. What induced him to report this dream to me was the circumstance that on the morning of November 18 he received a telegram announcing that his daughter had given birth to twins. The telegram had been handed in the day before and the birth had taken place during the night of November 16-17, at about the same time at which he had had the dream of his wife's twin birth. The dreamer asked me whether I thought the coincidence between dream and event was accidental. He did not venture to call the dream a telepathic one, since the difference between its content and the event affected precisely what seemed to him essential in it - the identity of the person who gave birth to the children. But one of his comments shows that he would not have been astonished at an actual telepathic dream: he believed his daughter would have thought particularly of him during her labour.

I feel sure, Ladies and Gentlemen, that you have been able to explain this dream already and understand too why I have told it you. Here was a man who was dissatisfied with his second wife and who would prefer his wife to be like the daughter of his first marriage. This 'like' dropped out, of course, so far as the unconscious was concerned. And now the telepathic message arrived during the night to say that his daughter had given birth to twins. The dream-work took control of the news, allowed the unconscious wish to operate on it - the wish that he could put his daughter in the place of his second wife - and thus arose the puzzling manifest dream, which disguised the wish and distorted the message. We must admit that it is only the *interpretation* of the dream that has shown us that it was a telepathic one: psycho-analysis has revealed a telepathic event which we should not otherwise have discovered.

But pray do not let yourselves be misled! In spite of all this, dream-interpretation has told us nothing about the objective reality of the telepathic event. It may equally be an illusion which can be explained in another way. The man's latent dream-thoughts may have run: 'To-day is the day the confinement should take place if my daughter is really out in her reckoning by a month, as I suspect. And when I saw her last she looked just as though she was going to have twins. How my dead wife who has so fond of children would have rejoiced over twins!' (I base this last factor on some associations of the dreamer's which I have not mentioned.) In that case the instigation to the dream would have been well-grounded suspicions on the dreamer's part and not a telepathic message; but the outcome would remain the same. You see then that even the interpretation of this dream has told us nothing on the question of whether we are to allow objective reality to telepathy. That could only be decided by a thorough-going investigation of all the circumstances of the case - which was unfortunately no more possible in this instance than in any of the others in my experience. Granted that the telepathy hypothesis offers by far the simplest explanation, yet that does not help us much. The simplest explanation is not always the correct one; the truth is often no simple matter, and before deciding in favour of such a far-reaching hypothesis we should like to have taken every precaution.

We may now leave the subject of dreams and telepathy: I have nothing more to say to you on it. But kindly observe that what seemed to us to teach us something about telepathy was not the dream but the interpretation of the dream, its psycho-analytic working-over. Accordingly, in what follows we may leave dreams entirely on one side and may follow an expectation that the employment of psycho-analysis may throw a little light on other events described as occult. There is, for instance, the phenomenon of thought-transference, which is so close to telepathy and can indeed without much violence be regarded as the same thing. It claims that mental processes in one person - ideas, emotional states, conative impulses - can be transferred to another person through empty space without employing the familiar methods of communication by means of words and signs. You will realize how remarkable, and perhaps even of what great practical importance, it would be if something of the kind really happened. It may be noted, incidentally, that strangely enough precisely this phenomenon is referred to least frequently in the miraculous stories of the past.

I have formed an impression in the course of the psycho-analytic treatment of patients that the activities of professional fortune-tellers conceal an opportunity for making particularly unobjectionable observations on thought-transference. These are insignificant and even inferior people, who immerse themselves in some sort of performance - lay out cards, study writing or lines upon the palm of the hand, or make astrological calculations - and at the same time, after having shown themselves familiar with portions of their visitor's past or present circumstances, go on to prophesy their future. As a rule their clients exhibit great satisfaction over these achievements and feel no resentment if later on these prophecies are not fulfilled. I have come across several such cases and have been able to study them analytically, and in a moment I will tell you the most remarkable of these instances. Their convincingness is unfortunately impaired by the numerous reticences to which I am compelled by the obligation of medical discretion. I have, however, of set purpose avoided distortions. So listen now to the story of one of my women patients, who had an experience of this kind with a fortune-teller.

She had been the eldest of a numerous family and had grown up with an extremely strong attachment to her father. She had married young and had found entire satisfaction in her marriage. Only one thing was wanting to her happiness: she had remained childless, so she could not bring her beloved husband completely into the place of her father. When, after long years of disappointment, she decided to undergo a gynaecological operation, her husband revealed to her that the blame was his: an illness before their marriage had made him incapable of procreating children. She took the disappointment badly, became neurotic and clearly suffered from fears of being tempted. To cheer her up, he took her with him on a business trip to Paris. They were sitting there one day in the hall of their hotel when she noticed a stir among the hotel servants. She asked what was going on and was told that Monsieur le Professeur had arrived and was giving consultations in a little room over there. She expressed a wish to have a try. Her husband rejected the idea, but while he was not watching she slipped into the consulting-room and faced the fortune-teller. She was 27 years old, but looked much younger and had taken off her wedding-ring. Monsieur le Professeur made her lay her hand on a tray filled with ashes and carefully studied the imprint; he then told her all kinds of things about hard struggles that lay before her, and ended with the comforting assurance that all the same she would still get married and would have two children by the time she was 32. When she told me this story she was 43 years old, seriously ill and without any prospect of ever having a child. Thus the prophecy had not come true; yet she spoke of it without any sort of bitterness but with an unmistakable expression of satisfaction, as though she were recalling a cheerful event. It was easy to establish that she had not the slightest notion of what the two numbers in the prophecy might mean or whether they meant anything at all.

You will say that this is a stupid and incomprehensible story and ask why I have told it you. I should be entirely of your opinion if - and this is the salient point - analysis had not made it possible to arrive at an interpretation of the prophecy which is convincing precisely from the explanation it affords of the details. For the two numbers find their place in the life of my patient's *mother*. She had married late - not till she was over thirty, and in the family they had often dwelt on the fact of the success with which she had hastened to make up for lost time. Her two first children (with our patient the elder) had been born with the shortest possible interval between them, in a single calendar year; and she had in fact two children by the time she was 32. What Monsieur le Professeur had said to my patient meant therefore: 'Take comfort from the fact of being so young. You'll have the same destiny as your mother, who also had to wait a long time for children, and you'll have two children by the time you're 32.' But to have the same destiny as her mother, to put herself in her mother's place, to take her place with her father - that had been the strongest wish of her youth, the wish on account of whose non-fulfilment she was just beginning to fall ill. The prophecy promised her that the wish would still be fulfilled in spite of everything; how could she fail to feel friendly to the prophet? Do you regard it as possible, however, that Monsieur le Professeur was familiar with the facts of the intimate family history of his chance client? Out of the question! How, then, did he arrive at the knowledge which enabled him to give expression to my patient's strongest and most secret wish by including the two numbers in his prophecy? I can see only two possible explanations. Either the story as it was told me is untrue and the events occurred otherwise, or thought-transference exists as a real phenomenon. One can suppose, no doubt, that after an interval of 16 years the patient had introduced the two numbers concerned into her recollection from her unconscious. I have no basis for this suspicion, but I cannot exclude it, and I imagine that you will be readier to believe in a way out of that kind than in the reality of thought-transference. If you do decide on the latter course, do not forget that it was only analysis that created the occult fact - uncovered it when it lay distorted to the point of being unrecognizable.

If it were a question of *one* case only like that of my patient, one would shrug it aside. No one would dream of erecting upon a single observation a belief which implies taking such a decisive line. But you must believe me when I assure you that this is not the only case in my experience. I have collected a whole number of such prophecies and from all of them I gained the impression that the fortune-teller had merely brought to expression the thoughts, and more especially the secret wishes, of those who were questioning him, and that we were therefore justified in analysing these prophecies as though they were subjective products, phantasies or dreams of the people concerned. Not every case, of course, is equally convincing and in not every case is it equally possible to exclude more rational explanations; but, taking them as a whole, there remains a strong balance of probability in favour of thought-transference as a fact. The importance of the subject would justify me in producing all my cases to you; but that I cannot do, owing to the prolixity of description that would be involved and to the inevitable breach of the obligations of discretion. I will try so far as possible to appease my conscience in giving you a few more examples.

One day I was visited by a highly intelligent young man, a student preparing for his final examinations for a doctorate, but unable to take them since, as he complained, he had lost all interest and power of concentration and even any faculty for orderly memory. The previous history of this condition of quasi-paralysis was soon revealed: he had fallen ill after carrying out a great act of self-discipline. He had a sister, to whom he was attached by an intense but always restrained devotion, just as she was to him. 'What a pity we can't get married!' they would often say to each other. A respectable man fell in love with the sister; she responded to his affection, but her parents did not assent to the union. In their difficulty the young couple turned to her brother, nor did he refuse his help. He made it possible for them to correspond with each other, and his influence eventually persuaded the parents to consent. In the course of the engagement, however, an occurrence took place whose meaning it was easy to guess. He went with his future brother-in-law on a difficult mountain-climb without a guide; they lost their way and were in danger of not returning safe and sound. Shortly after his sister's marriage he fell into this condition of mental exhaustion.

The influence of psycho-analysis restored his ability to work and he left me in order to go in for his examinations; but after he had passed them successfully he came back to me for a short time in the autumn of the same year. It was then that he related a remarkable experience to me which he had had before the summer. In his University town there lived a fortune-teller who enjoyed great popularity. Even the Princes of the Royal House used to consult her before important undertakings. Her mode of operation was very simple. She asked to be given the date of the relevant person's birth; she required to know nothing else about him, not even his name. She then proceeded to consult her astrological books, made long calculations and finally uttered a prophecy relating to the person in question. My patient decided to call upon her mystical arts in connection with his brother-in-law. He visited her and told her the relevant date. After carrying out her calculations she made her prophecy: 'The person in question will die in July or August of this year of crayfish- or oyster-poisoning.' My patient finished his story with the words: 'It was quite marvellous!'

From the first I had listened with irritation. After this exclamation of his I went so far as to ask: 'What do you see that's so marvellous in this prophecy? Here we are in late autumn and your brother-in-law isn't dead or you'd have told me long ago. So the prophecy hasn't come true.' 'No doubt that's so,' he replied, 'but here is what's marvellous. My brother-in-law is passionately devoted to crayfish and oysters and in the previous summer - that's to say, *before* my visit to the fortune-teller - he had an attack of oyster-poisoning of which he nearly died.' What was I to say to this? I could only feel annoyed that this highly-educated man (who had moreover been through a successful analysis) should not have a clearer view of the position. I for my part, rather than believe that it is possible to calculate the onset of an attack of crayfish- or oyster-poisoning from astrological tables, prefer to suppose that my patient had not yet overcome his hatred for his rival, the repression of which had earlier led to his falling ill, and that the fortune-teller was simply giving expression to his own expectation: 'a taste of that kind isn't to be given up, and one day, all the same, it will be the end of him.' I must admit that I cannot think of any other explanation for this case, unless, perhaps, that my patient was having a joke with me. But neither then nor at a later time did he give me grounds for such a suspicion, and he seemed to be meaning what he said seriously.

Here is another case. A young man in a position of consequence was involved in a *liaison* with a *demi-mondaine* which was characterized by a curious compulsion. He was obliged from time to time to provoke her with derisive and insulting remarks till she was driven to complete desperation. When he had brought her to that point, he was relieved, became reconciled with her and made her a present. But now he wanted to be free of her: the compulsion seemed to him uncanny. He noticed that this *liaison* was damaging his reputation; he wanted to have a wife of his own and to raise a family. But since he could not get free from this *demi-mondaine* by his own strength, he called analysis to his help. After one of these abusive scenes, when the analysis had already started, he got her to write something on a piece of paper, so as to show it to a graphologist. The report that he received from him was that the writing was that of someone in extreme despair, who would certainly commit suicide in the next few days. This did not, it is true, occur and the lady remained alive; but the analysis succeeded in loosening his bonds. He left the lady and turned to a young girl who he expected would be able to make him a good wife. Soon afterwards a dream appeared which could only hint at a dawning doubt as to the girl's worthiness. He obtained a specimen of her writing too, took it to the same authority, and was given a verdict on her writing which confirmed his apprehensions. He therefore abandoned the idea of making her his wife.

In order to form an opinion of the graphologist's reports, especially the first one, we must know something of our subject's secret history. In his early youth he had (in accordance with his passionate nature) fallen in love to the pitch of frenzy with a married woman who was still young but nevertheless older than he was. When she rejected him, he made an attempt at suicide which, there can be no doubt, was seriously intended. It was only by a hair's breadth that he escaped death and he was only restored after a long period of nursing. But this wild action made a deep impression on the woman he loved; she granted him her favours, he became her lover and thenceforward remained secretly attached to her and served her with a truly chivalrous devotion. More than twenty years later, when they had both grown older - but the woman, naturally, more than he - the need was awakened in him to detach himself from her, to make himself free, to lead a life of his own, to set up a house and raise a family. And along with this feeling of satiety there arose in him his long-suppressed craving for vengeance on his mistress. As he had once tried to kill himself because she had spurned him, so he wished now to have the satisfaction of her seeking death because he left her. But his love was still too strong for it to be possible for this wish to become conscious in him; nor was he in a position to do her enough harm to drive her into death. In this frame of mind he took on the *demi-mondaine* as a sort of whipping-boy, to satisfy his thirst for revenge *in corpore vili*; and he allowed himself to practise upon her all the torments which he might expect would bring about with her the result he wished to produce on his mistress. The fact that the vengeance applied to the latter was betrayed by his making her into a confidante and adviser in his *liaison* instead of concealing his defection from her. The wretched woman, who had long fallen from giving to receiving favours, probably suffered more from his confidences than the *demi-mondaine* did from his brutalities. The compulsion of which he complained in regard to this substitutive figure, and which drove him to analysis, had of course been transferred on to her from his old mistress; it was from her that he wanted to free himself but could not. I am not an authority on handwriting and have no high opinion of the art of divining character from it; still less do I believe in the possibility of foretelling the writer's future in this way. You can see, however, whatever one may think of the value of graphology, that there is no mistaking the fact that the expert, when he promised that the writer of the specimen presented to him would commit suicide in the next few days, had once again only brought to light a powerful secret wish of the person who was questioning him. Something of the same kind happened afterwards in the case of the second report. What was there concerned, however, was not an unconscious wish; it was the questioner's dawning doubt and apprehension that found a clear expression from the graphologist's mouth. Incidentally, my patient succeeded, with the help of analysis, in finding an object for his love outside the magic circle in which he had been spellbound.

Ladies and Gentlemen, - You have now heard how dream-interpretation and psycho-analysis in general assist occultism. I have shown you from examples that by their application occult facts have been brought to light which would otherwise have remained unknown. Psycho-analysis cannot give a direct answer to the question that no doubt interests you the most - whether we are to believe in the objective reality of these findings. But the material revealed by its help makes an impression which is at all events favourable to an affirmative reply. Your interest will not come to a stop at this point, however. You will want to know what conclusions are justified by the incomparably richer material in which psycho-analysis has no part. But I cannot follow you there: it lies outside my province. The only further thing I could do would be to report observations to you which have at least so much relation to analysis that they were made during psycho-analytic treatment and were even perhaps made possible by its influence. I will tell you one such example - the one which has left the strongest impression behind on me. I shall tell it at great length and shall ask for your attention to a large number of details, though even so I shall have to suppress much that would have greatly increased the convincing force of the observation. It is an example in which the fact came clearly to light and did not need to be developed by analysis. In discussing it, however, we shall not be able to do without the help of analysis. But I will tell you in advance that this example too of apparent thought-transference in the analytic situation is not exempt from all doubts and that it does not allow us to take up an unqualified position in support of the reality of occult phenomena.

Listen then:- One autumn day in the year 1919, at about 10.45 a.m., Dr. David Forsyth, who had just arrived from London, sent in his card to me while I was working with a patient. (My respected colleague from London University will not, I feel sure, regard it as an indiscretion if in this way I betray the fact that he spent some months being initiated by me into the arts of psycho-analytic technique.) I only had time to greet him and to make an appointment to see him later. Dr. Forsyth had a claim to my particular interest; he was the first foreigner to come to me after I had been cut off by the war years and to bring a promise of better times. Soon afterwards, at eleven o'clock, Herr P., one of my patients, arrived - an intelligent and agreeable man, between forty and fifty years of age, who had originally come to me on account of difficulties with women. His case did not promise any therapeutic success; I had long before proposed our stopping the treatment, but he had wished to continue it, evidently because he felt comfortable in a well-tempered father-transference to me. At that period money played no part: there was too little of it about. The sessions which I spent with him were stimulating and refreshing for me as well, and consequently, in disregard of the strict rules of medical practice, analytic work was being carried on up to a foreseen time-limit.

That day P. returned to his attempts at having erotic relations with women and once again mentioned a pretty, piquante, penniless girl, with whom he felt he might succeed, if the fact of her being a virgin did not scare him off any serious attempt. He had often talked of her before but that day he told me for the first time that, though of course she had no notion of the true grounds of his impediment, she used to call him 'Herr von Vorsicht'. I was struck by this information; Dr. Forsyth's visiting card lay beside me, and I showed it to him.

These are the facts of the case. I expect they will seem to you paltry; but listen a little longer, there is more behind them.

When he was young, P. had spent some years in England and since then had retained a permanent interest in English literature. He possessed a rich English library and used to bring me books from it. I owe to him an acquaintance with such authors as Bennett and Galsworthy, of whom till then I had read little. One day he lent me a novel of Galsworthy's with the title *The Man of Property*, whose scene is laid in the bosom of a family invented by the author, bearing the name of 'Forsyte'. Galsworthy himself was evidently captivated by this creation of his, for in later volumes he repeatedly came back to the members of this family and finally collected all the tales relating to them under the title of *The Forsyte Saga*. Only a few days before the occurrence I am speaking of, he had brought me a fresh volume from this series. The name 'Forsyte', and everything typical that the author had sought to embody in it, had played a part, too, in my conversations with P. and it had become part of the secret language which so easily grows up between two people who see a lot of each other. Now the name 'Forsyte' in these novels differs little from that of my visitor 'Forsyth' and, as pronounced by a German, the two can scarcely be distinguished; and there is an English word with a meaning - 'foresight' - which we should also pronounce in the same way and which would be translated '*Voraussicht*' or '*Vorsicht*'. Thus P. had in fact selected from his personal concerns the very name with which I was occupied at the same time as a result of an occurrence of which he was unaware.

That begins to look better, you will agree. But we shall, I think, receive a stronger impression of the striking phenomenon and even obtain an insight into its determinants, if we throw some analytic light upon two other associations brought up by P. during the same session.

Firstly: One day of the previous week I had waited in vain for Herr P. at eleven o'clock, and had then gone out to visit Dr. Anton von Freund in his *pension*. I was surprised to find that Herr P. lived on another floor of the same building in which the *pension* was located. In connection with this I had later told P. that I had in a sense paid him a visit in his house; but I know definitely that I did not tell him the name of the person I visited in the *pension*. And now, shortly after mentioning 'Herr von Vorsicht' he asked me whether perhaps the Freud-Ottorego who was giving a course of lectures on English at the Volks universität' was my daughter. And for the first time during our long period of intercourse he gave my name the distorted form to which I have indeed become habituated by functionaries, officials and compositors: instead of 'Freud' he said 'Freund'.

Secondly: At the end of the same session he told me a dream, from which he had woken in a fright - a regular '*Alptraum*', he said. He added that not long ago he had forgotten the English word for that, and when someone had asked him said that the English for '*Alptraum*' was 'a mare's nest'. This was nonsense, of course, he went on; 'a mare's nest' meant something incredible, a cock-and-bull story: the translation of '*Alptraum*' was 'nightmare'. The only element in common between this association and the previous one seemed to be the element 'English'. I was however reminded of a small incident which had occurred about a month earlier. P. was sitting with me in the room when another visitor, a dear friend from London, Dr. Ernest Jones, unexpectedly came in after a long separation. I signed to him to go into the next room while I finished with P. The latter, however, had at once recognized him from his photograph hanging in the waiting-room, and even expressed a wish to be introduced to him. Now Jones is the author of a monograph on the *Alptraum* - the nightmare. I did not know whether P. was acquainted with it; he avoided reading analytic literature.

I should like to begin by putting before you an investigation of what analytic understanding can be arrived at of the background of P.'s associations and of the motives for them. P. was placed similarly to me in relation to the name 'Forsyte' or 'Forsyth'; it meant the same to him, and it was entirely to him that I owed my acquaintance with the name. The remarkable fact was that he brought the name into the analysis unheralded, only the briefest time after it had become significant to me in another sense owing to a new event - the London doctor's arrival. But the manner in which the name emerged in his analytic session is perhaps not less interesting than the fact itself. He did not say, for instance: 'The name "Forsyte", out of the novels you are familiar with, has just occurred to me.' He was able, without any conscious relation to that source, to weave the name into his own experiences and to produce it thence - a thing that might have happened long before but had not happened till then. What he *did* say now was: 'I'm a Forsyth too: that's what the girl calls me.' It is hard to mistake the mixture of jealous demand and melancholy self-deprecation which finds its expression in this remark. We shall not be going astray if we complete it in some such way as this: 'It's mortifying to me that your thoughts should be so intensely occupied with this new arrival. Do come back to me; after all I'm a Forsyth too though it's true I'm only a Herr von Vorsicht, as the girl says.' And thereupon his train of thought, passing along the associative threads of the element 'English' went back to two earlier events, which were able to stir up the same feelings of jealousy. 'A few days ago you paid a visit to my house - not, alas, to me but to a Herr von Freund.' This thought caused him to distort the name 'Freud' into 'Freund'. The 'Freud-Ottorego' from the lecture-syllabus must come in here because as a teacher of English she provided the manifest association. And now came the recollection of another visitor a few weeks before, of whom he was no doubt equally jealous, but for whom he also felt he was no match, for Dr. Jones was able to write a monograph on the nightmare whereas he was at best only able to produce such dreams himself. His mention of his mistake about the meaning of 'a mare's nest' comes into this connection, for it can only mean to say: 'After all I'm not a genuine Englishman any more than I'm a genuine Forsyth.'

Now I cannot describe his feelings of jealousy as either out of place or unintelligible. He had been warned that his analysis, and at the same time our contact, would come to an end as soon as foreign pupils and patients returned to Vienna; and that was in fact what happened shortly afterwards. What we have so far achieved, however, has been a piece of analytic work - the explanation of three associations brought up by him in the same session and nourished by the same motive: and this has not much to do with the other question of whether these associations could or could not have been made without thought-transference. This question arises in the case of each of the three associations and thus falls into three separate questions: Could P. have known that Dr. Forsyth had just paid me his first visit? Could he know the name of the person I had visited in his house? Did he know that Dr. Jones had written a monograph on the nightmare? Or was it only *my* knowledge about these things that was revealed in his associations? It will depend on the reply to these separate questions whether my observation allows of a conclusion favourable to thought-transference.

Let us leave the first question aside for a while; the other two can be dealt with more easily. The case of my visit to his *pension* makes a particularly convincing impression at first sight. I am certain that in my short, joking reference to my visit to his house I mentioned no name. I think it is most unlikely that P. made enquiries at the *pension* as to the name of the person concerned; I believe rather that the existence of that person remained entirely unknown to him. But the evidential value of this case is totally destroyed by a chance circumstance. The man whom I had visited at the *pension* was not only called 'Freund'; he was a true friend to us all. He was Dr. Anton von Freund whose donation had made the foundation of our publishing house possible. His early death, together with that of our colleague Karl Abraham a few years later, are the gravest misfortunes which have befallen the growth of psycho-analysis. It is possible, therefore, that I had said to Herr P.: 'I visited a friend in your house' and with this possibility the occult interest of his second association vanishes.

The impression made by the third association evaporates equally quickly. Could P. know that Jones had published a monograph on the nightmare if he never read any analytic literature? Yes, he could. He possessed books from our publishing house and could in any case have seen the titles of the new publications advertised on the wrappers. This cannot be proved, but neither can it be disproved. We can reach no decision, therefore, along this path. To my regret, this observation of mine suffers from the same weakness as so many similar ones: it was written down too late and was discussed at a time when I was no longer seeing Herr P. and could not question him further.

Let us go back to the first event, which even taken by itself supports the apparent fact of thought-transference. Could P. know that Dr. Forsyth had been with me a quarter of an hour before him? Could he have any knowledge at all of his existence or of his presence in Vienna? We must not give way to an inclination to deny both questions flatly. I can see a way that leads to a partly affirmative answer. I may after all have told Herr P. that I was expecting a doctor from England for instruction in analysis, as a first dove after the Deluge. This might have happened in the summer of 1919, for Dr. Forsyth had made arrangements with me by letter some months before his arrival. I may even have mentioned his name, though that seems to me most improbable. In view of the other connection which the name carried for both of us, a discussion of it must inevitably have followed, of which something would have remained in my memory. Nevertheless such a discussion may have taken place and I may have totally forgotten it afterwards, so that it became possible for the emergence of 'Herr von Vorsicht' in the analytic session to strike me as a miracle. If one regards oneself as a sceptic, it is a good plan to have occasional doubts about one's scepticism too. It may be that I too have a secret inclination towards the miraculous which thus goes half way to meet the creation of occult facts.

If we have thus got one miraculous possibility out of the way, there is another waiting for us, and the most difficult of all. Assuming that Herr P. knew that there was a Dr. Forsyth and that he was expected in Vienna in the autumn, how is it to be explained that he became receptive to his presence on the very day of his arrival and immediately after his first visit? One might say it was chance - that is, leave it unexplained. But it was precisely in order to exclude chance that I discussed P.'s other two associations, in order to show you that he was really occupied with jealous thoughts about people who visited me. Or one might, not to neglect the most extreme possibility, experiment with the hypothesis that P. had observed a special excitement about me (which, to be sure, I myself knew nothing of) and drew his conclusion from it. Or Herr P. (though he arrived a quarter of an hour after the Englishman left) met him on the short stretch of street which they both had to pass along, recognized him by his characteristically English appearance and, being in a permanent state of jealous expectation, thought: 'Ah, so that's Dr. Forsyth with whose arrival my analysis is to come to an end! And he's probably just come straight from the Professor.' I cannot carry these rationalistic speculations any further. We are once again left with a *non liquet*, but I must confess that I have a feeling that here too the scales weigh in favour of thought-transference. Moreover, I am certainly not alone in having been in the position of experiencing 'occult' events like this in the analytic situation. Helene Deutsch published some similar observations in 1926 and studied the question of their being determined by the transference relations between patient and analyst.

I am sure you will not feel very well satisfied with my attitude to this problem - with my not being entirely convinced but prepared to be convinced. You may perhaps say to yourselves: 'Here's another case of a man who has done honest work as a scientist all through his life and has grown feeble-minded, pious and credulous in his old age.' I am aware that a few great names must be included in this class, but you should not reckon me among them. At least I have not become pious, and I hope not credulous. It is only that, if one has gone about all one's life bending in order to avoid a painful collision with the facts, so too in one's old age one still keeps one's back ready to bow before new realities. No doubt you would like me to hold fast to a moderate theism and show myself relentless in my rejection of everything occult. But I am incapable of currying favour and I must urge you to have kindlier thoughts on the objective possibility of thought-transference and at the same time of telepathy as well.

You will not forget that here I am only treating these problems in so far as it is possible to approach them from the direction of psycho-analysis. When they first came into my range of vision more than ten years ago, I too felt a dread of a threat against our scientific *Weltanschauung*, which, I feared, was bound to give place to spiritualism or mysticism if portions of occultism were proved true. To-day I think otherwise. In my opinion it shows no great confidence in science if one does not think it capable of assimilating and working over whatever may perhaps turn out to be true in the assertions of occultists. And particularly so far as thought-transference is concerned, it seems actually to favour the extension of the scientific - or, as our opponents say, the mechanistic - mode of thought to the mental phenomena which are so hard to lay hold of. The telepathic process is supposed to consist in a mental act in one person instigating the same mental act in another person. What lies between these two mental acts may easily be a physical process into which the mental one is transformed at one end and which is transformed back once more into the same mental one at the other end. The analogy with other transformations, such as occur in speaking and hearing by telephone, would then be unmistakable. And only think if one could get hold of this physical equivalent of the psychical act! It would seem to me that psycho-analysis, by inserting the unconscious between what is physical and what was previously called 'psychical', has paved the way for the assumption of such processes as telepathy. If only one accustoms oneself to the idea of telepathy, one can accomplish a great deal with it - for the time being, it is true, only in imagination. It is a familiar fact that we do not know how the common purpose comes about in the great insect communities: possibly it is done by means of a direct psychical transference of this kind. One is led to a suspicion that this is the original, archaic method of communication between individuals and that in the course of phylogenetic evolution it has been replaced by the better method of giving information with the help of signals which are picked up by the sense organs. But the older method might have persisted in the background and still be able to put itself into effect under certain conditions - for instance, in passionately excited mobs. All this is still uncertain and full of unsolved riddles; but there is no reason to be frightened by it.

If there is such a thing as telepathy as a real process, we may suspect that, in spite of its being so hard to demonstrate, it is quite a common phenomenon. It would tally with our expectations if we were able to point to it particularly in the mental life of children. Here we are reminded of the frequent anxiety felt by children over the idea that their parents know all their thoughts without having to be told them - an exact counterpart and perhaps the source of the belief of adults in the omniscience of God. A short time ago Dorothy Burlingham, a trustworthy witness, in a paper on child analysis and the mother published some observations which, if they can be confirmed, would be bound to put an end to the remaining doubts on the reality of thought-transference. She made use of the situation, no longer a rare one, in which a mother and child are simultaneously in analysis, and reported some remarkable events such as the following. One day the mother spoke during her analytic session of a gold coin that had played a particular part in one of the scenes of her childhood. Immediately afterwards, after she had returned home, her little boy, about ten years old, came to her room and brought her a gold coin which he asked her to keep for him. She asked him in astonishment where he had got it from. He had been given it on his birthday; but his birthday had been several months earlier and there was no reason why the child should have remembered the gold coin precisely then. The mother reported the occurrence to the child's analyst and asked her to find out from the child the reason for his action. But the child's analysis threw no light on the matter; the action had forced its way that day into the child's life like a foreign body. A few weeks later the mother was sitting at her writing-desk to write down, as she had been told to do, an account of the experience, when in came the boy and asked for the gold coin back, as he wanted to take it with him to show in his analytic session. Once again the child's analysis could discover no explanation of his wish.

And this brings us back to psycho-analysis, which was what we started out from.

LECTURE XXXI

THE DISSECTION OF THE PSYCHICAL PERSONALITY

LADIES AND GENTLEMEN, - I know you are aware in regard to your own relations, whether with people or things, of the importance of your starting-point. This was also the case with psycho-analysis. It has not been a matter of indifference for the course of its development or for the reception it met with that it began its work on what is, of all the contents of the mind, most foreign to the ego - on symptoms. Symptoms are derived from the repressed, they are, as it were, its representatives before the ego; but the repressed is foreign territory to the ego - internal foreign territory - just as reality (if you will forgive the unusual expression) is external foreign territory. The path led from symptoms to the unconscious, to the life of the instincts, to sexuality; and it was then that psycho-analysis was met by the brilliant objection that human beings are not merely sexual creatures but have nobler and higher impulses as well. It might have been added that, exalted by their consciousness of these higher impulses, they often assume the right to think nonsense and to neglect facts.

You know better. From the very first we have said that human beings fall ill of a conflict between the claims of instinctual life and the resistance which arises within them against it; and not for a moment have we forgotten this resisting, repelling, repressing agency, which we thought of as equipped with its special forces, the ego-instincts, and which coincides with the ego of popular psychology. The truth was merely that, in view of the laborious nature of the progress made by scientific work, even psycho-analysis was not able to study every field simultaneously and to express its views on every problem in a single breath. But at last the point was reached when it was possible for us to divert our attention from the repressed to the repressing forces, and we faced this ego, which had seemed so self-evident, with the secure expectation that here once again we should find things for which we could not have been prepared. It was not easy, however, to find a first approach; and that is what I intend to talk to you about to-day.

I must, however, let you know of my suspicion that this account of mine of ego-psychology will affect you differently from the introduction into the psychical underworld which preceded it. I cannot say with certainty why this should be so. I thought first that you would discover that whereas what I reported to you previously were, in the main, facts, however strange and peculiar, now you will be listening principally to opinions - that is, to speculations. But that does not meet the position. After further consideration I must maintain that the amount of intellectual working-over of the factual material in our ego-psychology is not much greater than it was in the psychology of the neuroses. I have been obliged to reject other explanations as well of the result I anticipate: I now believe that it is somehow a question of the nature of the material itself and of our being unaccustomed to dealing with it. In any case, I shall not be surprised if you show yourselves even more reserved and cautious in your judgement than hitherto.

The situation in which we find ourselves at the beginning of our enquiry may be expected itself to point the way for us. We wish to make the ego the matter of our enquiry, our very own ego. But is that possible? After all, the ego is in its very essence a subject; how can it be made into an object? Well, there is no doubt that it can be. The ego can take itself as an object, can treat itself like other objects, can observe itself, criticize itself, and do Heaven knows what with itself. In this, one part of the ego is setting itself over against the rest. So the ego can be split; it splits itself during a number of its functions - temporarily at least. Its parts can come together again afterwards. That is not exactly a novelty, though it may perhaps be putting an unusual emphasis on what is generally known. On the other hand, we are familiar with the notion that pathology, by making things larger and coarser, can draw our attention to normal conditions which would otherwise have escaped us. Where it points to a breach or a rent, there may normally be an articulation present. If we throw a crystal to the floor, it breaks; but not into haphazard pieces. It comes apart along its lines of cleavage into fragments whose boundaries, though they were invisible, were predetermined by the crystal's structure. Mental patients are split and broken structures of this same kind. Even we cannot withhold from them something of the reverential awe which peoples of the past felt for the insane. They have turned away from external reality, but for that very reason they know more about internal, psychical reality and can reveal a number of things to us that would otherwise be inaccessible to us.

We describe one group of these patients as suffering from delusions of being observed. They complain to us that perpetually, and down to their most intimate actions, they are being molested by the observation of unknown powers - presumably persons - and that in hallucinations they hear these persons reporting the outcome of their observation: 'now he's going to say this, now he's dressing to go out' and so on. Observation of this sort is not yet the same thing as persecution, but it is not far from it; it presupposes that people distrust them, and expect to catch them carrying out forbidden actions for which they would be punished. How would it be if these insane people were right, if in each of us there is present in his ego an agency like this which observes and threatens to punish, and which in them has merely become sharply divided from their ego and mistakenly displaced into external reality?

I cannot tell whether the same thing will happen to you as to me. Ever since, under the powerful impression of this clinical picture, I formed the idea that the separation of the observing agency from the rest of the ego might be a regular feature of the ego's structure, that idea has never left me, and I was driven to investigate the further characteristics and connections of the agency which was thus separated off. The next step is quickly taken. The content of the delusions of being observed already suggests that the observing is only a preparation for judging and punishing, and we accordingly guess that another function of this agency must be what we call our conscience. There is scarcely anything else in us that we so regularly separate from our ego and so easily set over against it as precisely our conscience. I feel an inclination to do something that I think will give me pleasure, but I abandon it on the ground that my conscience does not allow it. Or I have let myself be persuaded by too great an expectation of pleasure into doing something to which the voice of conscience has objected and after the deed my conscience punishes me with distressing reproaches and causes me to feel remorse for the deed. I might simply say that the special agency which I am beginning to distinguish in the ego is conscience. But it is more prudent to keep the agency as something independent and to suppose that conscience is one of its functions and that self-observation, which is an essential preliminary to the judging activity of conscience, is another of them. And since when we recognize that something has a separate existence we give it a name of its own, from this time forward I will describe this agency in the ego as the '*super-ego*'.

I am now prepared to hear you ask me scornfully whether our ego-psychology comes down to nothing more than taking commonly used abstractions literally and in a crude sense, and transforming them from concepts into things - by which not much would be gained. To this I would reply that in ego-psychology it will be difficult to escape what is universally known; it will rather be a question of new ways of looking at things and new ways of arranging them than of new discoveries. So hold to your contemptuous criticism for the time being and await further explanations. The facts of pathology give our efforts a background that you would look for in vain in popular psychology. So I will proceed.

Hardly have we familiarized ourselves with the idea of a super-ego like this which enjoys a certain degree of autonomy, follows its own intentions and is independent of the ego for its supply of energy, than a clinical picture forces itself on our notice which throws a striking light on the severity of this agency and indeed its cruelty, and on its changing relations to the ego. I am thinking of the condition of melancholia, or, more precisely, of melancholic attacks, which you too will have heard plenty about, even if you are not psychiatrists. The most striking feature of this illness, of whose causation and mechanism we know much too little, is the way in which the super-ego - 'conscience', you may call it, quietly - treats the ego. While a melancholic can, like other people, show a greater or lesser degree of severity to himself in his healthy periods, during a melancholic attack his super-ego becomes over-severe, abuses the poor ego, humiliates it and ill-treats it, threatens it with the direst punishments, reproaches it for actions in the remotest past which had been taken lightly at the time - as though it had spent the whole interval in collecting accusations and had only been waiting for its present access of strength in order to bring them up and make a condemnatory judgement on their basis. The super-ego applies the strictest moral standard to the helpless ego which is at its mercy; in general it represents the claims of morality, and we realize all at once that our moral sense of guilt is the expression of the tension between the ego and the super-ego. It is a most remarkable experience to see morality, which is supposed to have been given us by God and thus deeply implanted in us, functioning as a periodic phenomenon. For after a certain number of months the whole moral fuss is over, the criticism of the super-ego is silent, the ego is rehabilitated and again enjoys all the rights of man till the next attack. In some forms of the disease, indeed, something of a contrary sort occurs in the intervals; the ego finds itself in a blissful state of intoxication, it celebrates a triumph, as though the super-ego had lost all its strength or had melted into the ego; and this liberated, manic ego permits itself a truly uninhibited satisfaction of all its appetites. Here are happenings rich in unsolved riddles!

No doubt you will expect me to give you more than a mere illustration when I inform you that we have found out all kinds of things about the formation of the super-ego - that is to say, about the origin of conscience. Following a well-known pronouncement of Kant's which couples the conscience within us with the starry Heavens, a pious man might well be tempted to honour these two things as the masterpieces of creation. The stars are indeed magnificent, but as regards conscience God has done an uneven and careless piece of work, for a large majority of men have brought along with them only a modest amount of it or scarcely enough to be worth mentioning. We are far from overlooking the portion of psychological truth that is contained in the assertion that conscience is of divine origin; but the thesis needs interpretation. Even if conscience is something 'within us', yet it is not so from the first. In this it is a real contrast to sexual life, which is in fact there from the beginning of life and not only a later addition. But, as is well known, young children are amoral and possess no internal inhibitions against their impulses striving for pleasure. The part which is later taken on by the super-ego is played to begin with by an external power, by parental authority. Parental influence governs the child by offering proofs of love and by threatening punishments which are signs to the child of loss of love and are bound to be feared on their own account. This realistic anxiety is the precursor of the later moral anxiety. So long as it is dominant there is no need to talk of a super-ego and of a conscience. It is only subsequently that the secondary situation develops (which we are all too ready to regard as the normal one), where the external restraint is internalized and the super-ego takes the place of the parental agency and observes, directs and threatens the ego in exactly the same way as earlier the parents did with the child.

The super-ego, which thus takes over the power, function and even the methods of the parental agency, is however not merely its successor but actually the legitimate heir of its body. It proceeds directly out of it, we shall learn presently by what process. First, however, we must dwell upon a discrepancy between the two. The super-ego seems to have made a one-sided choice and to have picked out only the parents' strictness and severity, their prohibiting and punitive function, whereas their loving care seems not to have been taken over and maintained. If the parents have really enforced their authority with severity we can easily understand the child's in turn developing a severe super-ego. But, contrary to our expectation, experience shows that the super-ego can acquire the same characteristic of relentless severity even if the upbringing had been mild and kindly and had so far as possible avoided threats and punishments. We shall come back later to this contradiction when we deal with the transformations of instinct during the formation of the super-ego.

I cannot tell you as much as I should like about the metamorphosis of the parental relationship into the super-ego, partly because that process is so complicated that an account of it will not fit into the framework of an introductory course of lectures such as I am trying to give you, but partly also because we ourselves do not feel sure that we understand it completely. So you must be content with the sketch that follows.

The basis of the process is what is called an 'identification' - that is to say, the assimilation of one ego to another one, as a result of which the first ego behaves like the second in certain respects, imitates it and in a sense takes it up into itself. Identification has been not unsuitably compared with the oral, cannibalistic incorporation of the other person. It is a very important form of attachment to someone else, probably the very first, and not the same thing as the choice of an object. The difference between the two can be expressed in some such way as this. If a boy identifies himself with his father, he wants to *be like* his father; if he makes him the object of his choice, he wants to *have* him, to possess him. In the first case his ego is altered on the model of his father; in the second case that is not necessary. Identification and object-choice are to a large extent independent of each other; it is however possible to identify oneself with someone whom, for instance, one has taken as a sexual object, and to alter one's ego on his model. It is said that the influencing of the ego by the sexual object occurs particularly often with women and is characteristic of femininity. I must already have spoken to you in my earlier lectures of what is by far the most instructive relation between identification and object-choice. It can be observed equally easily in children and adults, in normal as in sick people. If one has lost an object or has been obliged to give it up, one often compensates oneself by identifying oneself with it and by setting it up once more in one's ego, so that here object-choice regresses, as it were, to identification.

I myself am far from satisfied with these remarks on identification; but it will be enough if you can grant me that the installation of the super-ego can be described as a successful instance of identification with the parental agency. The fact that speaks decisively for this view is that this new creation of a superior agency within the ego is most intimately linked with the destiny of the Oedipus complex, so that the super-ego appears as the heir of that emotional attachment which is of such importance for childhood. With his abandonment of the Oedipus complex a child must, as we can see, renounce the intense object-cathexes which he has deposited with his parents, and it is as a compensation for this loss of objects that there is such a strong intensification of the identifications with his parents which have probably long been present in his ego. Identifications of this kind as precipitates of object-cathexes that have been given up will be repeated often enough later in the child's life; but it is entirely in accordance with the emotional importance of this first instance of such a transformation that a special place in the ego should be found for its outcome. Close investigation has shown us, too, that the super-ego is stunted in its strength and growth if the surmounting of the Oedipus complex is only incompletely successful. In the course of development the super-ego also takes on the influences of those who have stepped into the place of parents - educators, teachers, people chosen as ideal models. Normally it departs more and more from the original parental figures; it becomes, so to say, more impersonal. Nor must it be forgotten that a child has a different estimate of its parents at different periods of its life. At the time at which the Oedipus complex gives place to the super-ego they are something quite magnificent; but later they lose much of this. Identifications then come about with these later parents as well, and indeed they regularly make important contributions to the formation of character; but in that case they only affect the ego, they no longer influence the super-ego, which has been determined by the earliest parental imagos.

I hope you have already formed an impression that the hypothesis of the super-ego really describes a structural relation and is not merely a personification of some such abstraction as that of conscience. One more important function remains to be mentioned which we attribute to this super-ego. It is also the vehicle of the ego ideal by which the ego measures itself, which it emulates, and whose demand for ever greater perfection it strives to fulfil. There is no doubt that this ego ideal is the precipitate of the old picture of the parents, the expression of admiration for the perfection which the child then attributed to them.

I am sure you have heard a great deal of the sense of inferiority which is supposed particularly to characterize neurotics. It especially haunts the pages of what are known as *belles lettres*. An author who uses the term 'inferiority complex' thinks that by so doing he has fulfilled all the demands of psycho-analysis and has raised his composition to a higher psychological plane. In fact 'inferiority complex' is a technical term that is scarcely used in psycho-analysis. For us it does not bear the meaning of anything simple, let alone elementary. To trace it back to the self-perception of possible organic defects, as the school of what are known as 'Individual Psychologists' likes to do, seems to us a short-sighted error. The sense of inferiority has strong erotic roots. A child feels inferior if he notices that he is not loved, and so does an adult. The only bodily organ which is really regarded as inferior is the atrophied penis, a girl's clitoris. But the major part of the sense of inferiority derives from the ego's relation to its super-ego; like the sense of guilt it is an expression of the tension between them. Altogether, it is hard to separate the sense of inferiority and the sense of guilt. It would perhaps be right to regard the former as the erotic complement to the moral sense of inferiority. Little attention has been given in psycho-analysis to the question of the delimitation of the two concepts.

If only because the inferiority complex has become so popular, I will venture to entertain you here with a short digression. A historical personality of our own days, who is still alive though at the moment he has retired into the background, suffers from a defect in one of his limbs owing to an injury at the time of his birth. A very well-known contemporary writer who is particularly fond of compiling the biographies of celebrities has dealt, among others, with the life of the man I am speaking of. Now in writing a biography it may well be difficult to suppress a need to plumb the psychological depths. For this reason our author has ventured on an attempt to erect the whole of the development of his hero's character on the sense of inferiority which must have been called up by his physical defect. In doing so, he has overlooked one small but not insignificant fact. It is usual for mothers whom Fate has presented with a child who is sickly or otherwise at a disadvantage to try to compensate him for his unfair handicap by a superabundance of love. In the instance before us, the proud mother behaved otherwise; she withdrew her love from the child on account of his infirmity. When he had grown up into a man of great power, he proved unambiguously by his actions that he had never forgiven his mother. When you consider the importance of a mother's love for the mental life of a child, you will no doubt make a tacit correction of the biographer's inferiority theory.

But let us return to the super-ego. We have allotted it the functions of self-observation, of conscience and of the ideal. It follows from what we have said about its origin that it presupposes an immensely important biological fact and a fateful psychological one: namely, the human child's long dependence on its parents and the Oedipus complex, both of which, again, are intimately interconnected. The super-ego is the representative for us of every moral restriction, the advocate of a striving towards perfection - it is, in short, as much as we have been able to grasp psychologically of what is described as the higher side of human life. Since it itself goes back to the influence of parents, educators and so on, we learn still more of its significance if we turn to those who are its sources. As a rule parents and authorities analogous to them follow the precepts of their own super-egos in educating children. Whatever understanding their ego may have come to with their super-ego, they are severe and exacting in educating children. They have forgotten the difficulties of their own childhood and they are glad to be able now to identify themselves fully with their own parents who in the past laid such severe restrictions upon them. Thus a child's super-ego is in fact constructed on the model not of its parents but of its parents' super-ego; the contents which fill it are the same and it becomes the vehicle of tradition and of all the time-resisting judgements of value which have propagated themselves in this manner from generation to generation. You may easily guess what important assistance taking the super-ego into account will give us in our understanding of the social behaviour of mankind - in the problem of delinquency, for instance - and perhaps even what practical hints on education. It seems likely that what are known as materialistic views of history sin in under-estimating this factor. They brush it aside with the remark that human 'ideologies' are nothing other than the product and superstructure of their contemporary economic conditions. That is true, but very probably not the whole truth. Mankind never lives entirely in the present. The past, the tradition of the race and of the people, lives on in the ideologies of the super-ego, and yields only slowly to the influences of the present and to new changes; and so long as it operates through the super-ego it plays a powerful part in human life, independently of economic conditions.

In 1921 I endeavoured to make use of the differentiation between the ego and the super-ego in a study of group psychology. I arrived at a formula such as this: a psychological group is a collection of individuals who have introduced the same person into their super-ego and, on the basis of this common element, have identified themselves with one another in their ego. This applies, of course, only to groups that have a leader. If we possessed more applications of this kind, the hypothesis of the super-ego would lose its last touch of strangeness for us, and we should become completely free of the embarrassment that still comes over us when, accustomed as we are to the atmosphere of the underworld, we move in the more superficial, higher strata of the mental apparatus. We do not suppose, of course, that with the separation off of the super-ego we have said the last word on the psychology of the ego. It is rather a first step; but in this case it is not only the first step that is hard.

Now, however, another problem awaits us - at the opposite end of the ego, as we might put it. It is presented to us by an observation during the work of analysis, an observation which is actually a very old one. As not infrequently happens, it has taken a long time to come to the point of appreciating its importance. The whole theory of psycho-analysis is, as you know, in fact built up on the perception of the resistance offered to us by the patient when we attempt to make his unconscious conscious to him. The objective sign of this resistance is that his associations fail or depart widely from the topic that is being dealt with. He may also recognize the resistance *subjectively* by the fact that he has distressing feelings when he approaches the topic. But this last sign may also be absent. We then say to the patient that we infer from his behaviour that he is now in a state of resistance; and he replies that he knows nothing of that, and is only aware that his associations have become more difficult. It turns out that we were right; but in that case his resistance was unconscious too, just as unconscious as the repressed, at the lifting of which we were working. We should long ago have asked the question: from what part of his mind does an unconscious resistance like this arise? The beginner in psycho-analysis will be ready at once with the answer: it is, of course, the resistance of the unconscious. An ambiguous and unserviceable answer! If it means that the resistance arises from the repressed, we must rejoin: certainly not! We must rather attribute to the repressed a strong upward drive, an impulsion to break through into consciousness. The resistance can only be a manifestation of the ego, which originally put the repression into force and now wishes to maintain it. That, moreover, is the view we always took. Since we have come to assume a special agency in the ego, the super-ego, which represents demands of a restrictive and rejecting character, we may say that repression is the work of this super-ego and that it is carried out either by itself or by the ego in obedience to its orders. If then we are met by the case of the resistance in analysis not being conscious to the patient, this means either that in quite important situations the super-ego and the ego can operate unconsciously, or - and this would be still more important - that portions of both of them, the ego and the super-ego themselves, are unconscious. In both cases we have to reckon with the disagreeable discovery that on the one hand (super-) ego and conscious and on the other hand repressed and unconscious are far from coinciding.

And here, Ladies and Gentlemen, I feel that I must make a pause to take breath - which you too will welcome as a relief - and, before I go on, to apologize to you. My intention is to give you some addenda to the introductory lectures on psycho-analysis which I began fifteen years ago, and I am obliged to behave as though you as well as I had in the interval done nothing but practise psycho-analysis. I know that that assumption is out of place; but I am helpless, I cannot do otherwise. This is no doubt related to the fact that it is in general so hard to give anyone who is not himself a psycho-analyst an insight into psycho-analysis. You can believe me when I tell you that we do not enjoy giving an impression of being members of a secret society and of practising a mystical science. Yet we have been obliged to recognize and express as our conviction that no one has a right to join in a discussion of psycho-analysis who has not had particular experiences which can only be obtained by being analysed oneself. When I gave you my lectures fifteen years ago I tried to spare you certain speculative portions of our theory; but it is precisely from them that are derived the new acquisitions of which I must speak to you to-day.

I return now to our topic. In face of the doubt whether the ego and super-ego are themselves unconscious or merely produce unconscious effects, we have, for good reasons, decided in favour of the former possibility. And it is indeed the case that large portions of the ego and super-ego can remain unconscious and are normally unconscious. That is to say, the individual knows nothing of their contents and it requires an expenditure of effort to make them conscious. It is a fact that ego and conscious, repressed and unconscious do not coincide. We feel a need to make a fundamental revision of our attitude to the problem of conscious-unconscious. At first we are inclined greatly to reduce the value of the criterion of being conscious since it has shown itself so untrustworthy. But we should be doing it an injustice. As may be said of our life, it is not worth much, but it is all we have. Without the illumination thrown by the quality of consciousness, we should be lost in the obscurity of depth-psychology; but we must attempt to find our bearings afresh.

There is no need to discuss what is to be called conscious: it is removed from all doubt. The oldest and best meaning of the word 'unconscious' is the descriptive one; we call a psychical process unconscious whose existence we are obliged to assume - for some such reason as that we infer it from its effects -, but of which we know nothing. In that case we have the same relation to it as we have to a psychical process in another person, except that it is in fact one of our own. If we want to be still more correct, we shall modify our assertion by saying that we call a process unconscious if we are obliged to assume that it is being activated *at the moment*, though *at the moment* we know nothing about it. This qualification makes us reflect that the majority of conscious processes are conscious only for a short time; very soon they become *latent*, but can easily become conscious again. We might also say that they had become unconscious, if it were at all certain that in the condition of latency they are still something psychical. So far we should have learnt nothing new; nor should we have acquired the right to introduce the concept of an unconscious into psychology. But then comes the new observation that we were already able to make in parapraxes. In order to explain a slip of the tongue, for instance, we find ourselves obliged to assume that the intention to make a particular remark was present in the subject. We infer it with certainty from the interference with his remark which has occurred; but the intention did not put itself through and was thus unconscious. If, when we subsequently put it before the speaker, he recognizes it as one familiar to him, then it was only temporarily unconscious to him; but if he repudiates it as something foreign to him, then it was permanently unconscious. From this experience we retrospectively obtain the right also to pronounce as something unconscious what had been described as latent. A consideration of these dynamic relations permits us now to distinguish two kinds of unconscious - one which is easily, under frequently occurring circumstances, transformed into something conscious, and another with which this transformation is difficult and takes place only subject to a considerable expenditure of effort or possibly never at all. In order to escape the ambiguity as to whether we mean the one or the other unconscious, whether we are using the word in the descriptive or in the dynamic sense, we make use of a permissible and simple way out. We call the unconscious which is only latent, and thus easily becomes conscious, the 'preconscious' and retain the term 'unconscious' for the other. We now have three terms, 'conscious', 'preconscious' and 'unconscious', with which we can get along in our description of mental phenomena. Once again: the preconscious is also unconscious in the purely descriptive sense, but we do not give it that name, except in talking loosely or when we have to make a defence of the existence in mental life of unconscious processes in general.

You will admit, I hope, that so far that is not too bad and allows of convenient handling. Yes, but unluckily the work of psycho-analysis has found itself compelled to use the word 'unconscious' in yet another, third, sense, and this may, to be sure, have led to confusion. Under the new and powerful impression of there being an extensive and important field of mental life which is normally withdrawn from the ego's knowledge so that the processes occurring in it have to be regarded as unconscious in the truly dynamic sense, we have come to understand the term 'unconscious' in a topographical or systematic sense as well; we have come to speak of a 'system' of the preconscious and a 'system' of the unconscious, of a conflict between the ego and the system *Ucs.*, and have used the word more and more to denote a mental province rather than a quality of what is mental. The discovery, actually an inconvenient one, that portions of the ego and super-ego as well are unconscious in the dynamic sense, operates at this point as a relief - it makes possible the removal of a complication. We perceive that we have no right to name the mental region that is foreign to the ego 'the system *Ucs.*', since the characteristic of being unconscious is not restricted to it. Very well; we will no longer use the term 'unconscious' in the systematic sense and we will give what we have hitherto so described a better name and one no longer open to misunderstanding. Following a verbal usage of Nietzsche's and taking up a suggestion by Georg Groddeck, we will in future call it the 'id'. This impersonal pronoun seems particularly well suited for expressing the main characteristic of this province of the mind - the fact of its being alien to the ego. The super-ego, the ego and the id - these, then, are the three realms, regions, provinces, into which we divide an individual's mental apparatus, and with the mutual relations of which we shall be concerned in what follows.

But first a short interpolation. I suspect that you feel dissatisfied because the three qualities of the characteristic of consciousness and the three provinces of the mental apparatus do not fall together into three peaceable couples, and you may regard this as in some sense obscuring our findings. I do not think, however, that we should regret it, and we should tell ourselves that we had no right to expect any such smooth arrangement. Let me give you an analogy; analogies, it is true, decide nothing, but they can make one feel more at home. I am imagining a country with a landscape of varying configuration - hill-country, plains, and chains of lakes -, and with a mixed population; it is inhabited by Germans, Magyars and Slovaks, who carry on different activities. Now things might be partitioned in such a way that the Germans, who breed cattle, live in the hill-country, the Magyars, who grow cereals and wine, live in the plains, and the Slovaks, who catch fish and plait reeds, live by the lakes. If the partitioning could be neat and clear-cut like this, a Woodrow Wilson would be delighted by it; it would also be convenient for a lecture in a geography lesson. The probability is, however, that you will find less orderliness and more mixing, if you travel through the region. Germans, Magyars and Slovaks live interspersed all over it; in the hill-country there is agricultural land as well, cattle are bred in the plains too. A few things are naturally as you expected, for fish cannot be caught in the mountains and wine does not grow in the water. Indeed, the picture of the region that you brought with you may on the whole fit the facts; but you will have to put up with deviations in the details.

You will not expect me to have much to tell you that is new about the id apart from its new name. It is the dark, inaccessible part of our personality; what little we know of it we have learnt from our study of the dream-work and of the construction of neurotic symptoms, and most of that is of a negative character and can be described only as a contrast to the ego. We approach the id with analogies: we call it a chaos, a cauldron full of seething excitations. We picture it as being open at its end to somatic influences, and as there taking up into itself instinctual needs which find their psychical expression in it, but we cannot say in what substratum. It is filled with energy reaching it from the instincts, but it has no organization, produces no collective will, but only a striving to bring about the satisfaction of the instinctual needs subject to the observance of the pleasure principle. The logical laws of thought do not apply in the id, and this is true above all of the law of contradiction. Contrary impulses exist side by side, without cancelling each other out or diminishing each other: at the most they may converge to form compromises under the dominating economic pressure towards the discharge of energy. There is nothing in the id that could be compared with negation; and we perceive with surprise an exception to the philosophical theorem that space and time are necessary forms of our mental acts. There is nothing in the id that corresponds to the idea of time; there is no recognition of the passage of time, and - a thing that is most remarkable and awaits consideration in philosophical thought - no alteration in its mental processes is produced by the passage of time. Wishful impulses which have never passed beyond the id, but impressions, too, which have been sunk into the id by repression, are virtually immortal; after the passage of decades they behave as though they had just occurred. They can only be recognized as belonging to the past, can only lose their importance and be deprived of their cathexis of energy, when they have been made conscious by the work of analysis, and it is on this that the therapeutic effect of analytic treatment rests to no small extent.

Again and again I have had the impression that we have made too little theoretical use of this fact, established beyond any doubt, of the unalterability by time of the repressed. This seems to offer an approach to the most profound discoveries. Nor, unfortunately, have I myself made any progress here.

The id of course knows no judgements of value: no good and evil, no morality. The economic or, if you prefer, the quantitative factor, which is intimately linked to the pleasure principle, dominates all its processes. Instinctual cathexes seeking discharge - that, in our view, is all there is in the id. It even seems that the energy of these instinctual impulses is in a state different from that in the other regions of the mind, far more mobile and capable of discharge; otherwise the displacements and condensations would not occur which are characteristic of the id and which so completely disregard the *quality* of what is cathected - what in the ego we should call an idea. We would give much to understand more about these things! You can see, incidentally, that we are in a position to attribute to the id characteristics other than that of its being unconscious, and you can recognize the possibility of portions of the ego and super-ego being unconscious without possessing the same primitive and irrational characteristics.

We can best arrive at the characteristics of the actual ego, in so far as it can be distinguished from the id and from the super-ego, by examining its relation to the outermost superficial portion of the mental apparatus, which we describe as the system *Pcpt.-Cs.* This system is turned towards the external world, it is the medium for the perceptions arising thence, and during its functioning the phenomenon of consciousness arises in it. It is the sense-organ of the entire apparatus; moreover it is receptive not only to excitations from outside but also to those arising from the interior of the mind. We need scarcely look for a justification of the view that the ego is that portion of the id which was modified by the proximity and influence of the external world, which is adapted for the reception of stimuli and as a protective shield against stimuli, comparable to the cortical layer by which a small piece of living substance is surrounded. The relation to the external world has become the decisive factor for the ego; it has taken on the task of representing the external world to the id - fortunately for the id, which could not escape destruction if, in its blind efforts for the satisfaction of its instincts, it disregarded that supreme external power. In accomplishing this function, the ego must observe the external world, must lay down an accurate picture of it in the memory-traces of its perceptions, and by its exercise of the function of 'reality-testing' must put aside whatever in this picture of the external world is an addition derived from internal sources of excitation. The ego controls the approaches to motility under the id's orders; but between a need and an action it has interposed a postponement in the form of the activity of thought, during which it makes use of the mnemonic residues of experience. In that way it has dethroned the pleasure principle which dominates the course of events in the id without any restriction and has replaced it by the reality principle, which promises more certainty and greater success.

The relation to time, which is so hard to describe, is also introduced into the ego by the perceptual system; it can scarcely be doubted that the mode of operation of that system is what provides the origin of the idea of time. But what distinguishes the ego from the id quite especially is a tendency to synthesis in its contents, to a combination and unification in its mental processes which are totally lacking in the id. When presently we come to deal with the instincts in mental life we shall, I hope, succeed in tracing this essential characteristic of the ego back to its source. It alone produces the high degree of organization which the ego needs for its best achievements. The ego develops from perceiving the instincts to controlling them; but this last is only achieved by the representative of the instinct being allotted its proper place in a considerable assemblage, by its being taken up into a coherent context. To adopt a popular mode of speaking, we might say that the ego stands for reason and good sense while the id stands for the untamed passions.

So far we have allowed ourselves to be impressed by the merits and capabilities of the ego; it is now time to consider the other side as well. The ego is after all only a portion of the id, a portion that has been expediently modified by the proximity of the external world with its threat of danger. From a dynamic point of view it is weak, it has borrowed its energies from the id, and we are not entirely without insight into the methods - we might call them dodges - by which it extracts further amounts of energy from the id. One such method, for instance, is by identifying itself with actual or abandoned objects. The object-cathexes spring from the instinctual demands of the id. The ego has in the first instance to take note of them. But by identifying itself with the object it recommends itself to the id in place of the object and seeks to divert the id's libido on to itself. We have already seen that in the course of its life the ego takes into itself a large number of precipitates like this of former object-cathexes. The ego must on the whole carry out the id's intentions, it fulfils its task by finding out the circumstances in which those intentions can best be achieved. The ego's relation to the id might be compared with that of a rider to his horse. The horse supplies the locomotive energy, while the rider has the privilege of deciding on the goal and of guiding the powerful animal's movement. But only too often there arises between the ego and the id the not precisely ideal situation of the rider being obliged to guide the horse along the path by which it itself wants to go.

There is one portion of the id from which the ego has separated itself by resistances due to repression. But the repression is not carried over into the id: the repressed merges into the remainder of the id.

We are warned by a proverb against serving two masters at the same time. The poor ego has things even worse: it serves three severe masters and does what it can to bring their claims and demands into harmony with one another. These claims are always divergent and often seem incompatible. No wonder that the ego so often fails in its task. Its three tyrannical masters are the external world, the super-ego and the id. When we follow the ego's efforts to satisfy them simultaneously - or rather, to obey them simultaneously - we cannot feel any regret at having personified this ego and having set it up as a separate organism. It feels hemmed in on three sides, threatened by three kinds of danger, to which, if it is hard pressed, it reacts by generating anxiety. Owing to its origin from the experiences of the perceptual system, it is earmarked for representing the demands of the external world, but it strives too to be a loyal servant of the id, to remain on good terms with it, to recommend itself to it as an object and to attract its libido to itself. In its attempts to mediate between the id and reality, it is often obliged to cloak the *Ucs.* commands of the id with its own *Pcs.* rationalizations, to conceal the id's conflicts with reality, to profess, with diplomatic disingenuousness, to be taking notice of reality even when the id has remained rigid and unyielding. On the other hand it is observed at every step it takes by the strict super-ego, which lays down definite standards for its conduct, without taking any account of its difficulties from the direction of the id and the external world, and which, if those standards are not obeyed, punishes it with tense feelings of inferiority and of guilt. Thus the ego, driven by the id, confined by the super-ego, repulsed by reality, struggles to master its economic task of bringing about harmony among the forces and influences working in and upon it; and we can understand how it is that so often we cannot suppress a cry: 'Life is not easy!' If the ego is obliged to admit its weakness it breaks out in anxiety - realistic anxiety regarding the external world, moral anxiety regarding the super-ego and neurotic anxiety regarding the strength of the passions in the id.

I should like to portray the structural relations of the mental personality, as I have described them to you, in the unassuming sketch which I now present you with:

As you see here, the super-ego merges into the id; indeed, as heir to the Oedipus complex it has intimate relations with the id; it is more remote than the ego from the perceptual system. The id has intercourse with the external world only through the ego - at least, according to this diagram. It is certainly hard to say to-day how far the drawing is correct. In one respect it is undoubtedly not. The space occupied by the unconscious id ought to have been incomparably greater than that of the ego or the preconscious. I must ask you to correct it in your thoughts.

And here is another warning, to conclude these remarks, which have certainly been exacting and not, perhaps, very illuminating. In thinking of this division of the personality into an ego, a super-ego and an id, you will not, of course, have pictured sharp frontiers like the artificial ones drawn in political geography. We cannot do justice to the characteristics of the mind by linear outlines like those in a drawing or in primitive painting, but rather by areas of colour melting into one another as they are presented by modern artists. After making the separation we must allow what we have separated to merge together once more. You must not judge too harshly a first attempt at giving a pictorial representations of something so intangible as psychical processes. It is highly probable that the development of these divisions is subject to great variations in different individuals; it is possible that in the course of actual functioning they may change and go through a temporary phase of involution. Particularly in the case of what is phylogenetically the last and most delicate of these divisions - the differentiation between the ego and the super-ego - something of the sort seems to be true. There is no question but that the same thing results from psychical illness. It is easy to imagine, too, that certain mystical practices may succeed in upsetting the normal relations between the different regions of the mind, so that, for instance, perception may be able to grasp happenings in the depths of the ego and in the id which were otherwise inaccessible to it. It may safely be doubted, however, whether this road will lead us to the ultimate truths from which salvation is to be expected. Nevertheless it may be admitted that the therapeutic efforts of psycho-analysis have chosen a similar line of approach. Its intention is, indeed, to strengthen the ego, to make it more independent of the super-ego, to widen its field of perception and enlarge its organization, so that it can appropriate fresh portions of the id. Where id was, there ego shall be. It is a work of culture - not unlike the draining of the Zuider Zee.

LECTURE XXXII

ANXIETY AND INSTINCTUAL LIFE

LADIES AND GENTLEMEN, - You will not be surprised to hear that I have a number of novelties to report to you about our conception of anxiety and of the basic instincts of mental life; nor will you be surprised to learn that none of these novelties can claim to offer a final solution of these still unsettled problems. I have a particular reason for using the word 'conception' here. These are the most difficult problems that are set to us, but their difficulty does not lie in any insufficiency of observations; what present us with these riddles are actually the commonest and most familiar of phenomena. Nor does the difficulty lie in the recondite nature of the speculations to which they give rise; speculative consideration plays little part in this sphere. But it is truly a matter of conceptions - that is to say, of introducing the right abstract ideas, whose application to the raw material of observation will produce order and clarity in it.

I devoted a lecture (the twenty-fifth) to anxiety in my previous series; and I must briefly recapitulate what I said in it. We described anxiety as an affective state - that is to say, a combination of certain feelings in the pleasure-unpleasure series with the corresponding innervations of discharge and a perception of them, but probably also the precipitate of a particular important event, incorporated by inheritance - something that may thus be likened to an individually acquired hysterical attack. The event which we look upon as having left behind it an affective trace of this sort is the process of birth, at the time of which the effects upon the heart's action and upon respiration characteristic of anxiety were expedient ones. The very first anxiety would thus have been a toxic one. We then started off from a distinction between realistic anxiety and neurotic anxiety, of which the former was a reaction, which seemed intelligible to us, to a danger - that is, to an expected injury from outside - while the latter was completely enigmatic, and appeared to be pointless.

In an analysis of realistic anxiety we brought it down to the state of increased sensory attention and motor tension which we describe as 'preparedness for anxiety'. It is out of this that the anxiety reaction develops. Here two outcomes are possible. Either the generation of anxiety - the repetition of the old traumatic experience - is limited to a signal, in which case the remainder of the reaction can adapt itself to the new situation of danger and can proceed to flight or defence; or the old situation can retain the upper hand and the total reaction may consist in no more than a generation of anxiety, in which case the affective state becomes paralysing and will be inexpedient for present purposes.

We then turned to neurotic anxiety and pointed out that we observe it under three conditions. We find it first as a freely floating, general apprehensiveness, ready to attach itself temporarily, in the form of what is known as 'expectant anxiety', to any possibility that may freshly arise - as happens, for instance, in a typical anxiety neurosis. Secondly, we find it firmly attached to certain ideas in the so-called 'phobias', in which it is still possible to recognize a relation to external danger but in which we must judge the fear exaggerated out of all proportion. Thirdly and lastly, we find anxiety in hysteria and other forms of severe neurosis, where it either accompanies symptoms or emerges independently as an attack or more persistent state, but always without any visible basis in an external danger. We then asked ourselves two questions: 'What are people afraid of in neurotic anxiety?' and 'How are we to bring it into relation with realistic anxiety felt in the face of external dangers?'

Our investigations were far from remaining unsuccessful: we reached a few important conclusions. In regard to anxious expectation clinical experience revealed that it had a regular connection with the libidinal economics of sexual life. The commonest cause of anxiety neurosis is unconsummated excitation. Libidinal excitation is aroused but not satisfied, not employed; apprehensiveness then appears instead of this libido that has been diverted from its employment. I even thought I was justified in saying that this unsatisfied libido was directly changed into anxiety. This view found support in some quite regularly occurring phobias of small children. Many of these phobias are very puzzling to us, but others, such as the fear of being alone and the fear of strangers, can be explained with certainty. Loneliness as well as a strange face arouse the child's longing for his familiar mother; he is unable to control this libidinal excitation, he cannot hold it in suspense but changes it into anxiety. This infantile anxiety must therefore be regarded not as of the realistic but as of the neurotic kind. Infantile phobias and the expectation of anxiety in anxiety neurosis offer us two examples of one way in which neurotic anxiety originates: by a direct transformation of libido. We shall at once come to know of a second mechanism, but it will turn out not to be very different from the first.

For we consider that what is responsible for the anxiety in hysteria and other neuroses is the process of repression. We believe it is possible to give a more complete account of this than before, if we separate what happens to the idea that has to be repressed from what happens to the quota of libido attaching to it. It is the idea which is subjected to repression and which may be distorted to the point of being unrecognizable; but its quota of affect is regularly transformed into anxiety - and this is so whatever the nature of the affect may be, whether it is aggressiveness or love. It makes no essential difference, then, for what reason a quota of libido has become unemployable: whether it is on account of the infantile weakness of the ego, as in children's phobias, or on account of somatic processes in sexual life, as in anxiety neurosis, or owing to repression, as in hysteria. Thus in reality the two mechanisms that bring about neurotic anxiety coincide.

In the course of these investigations our attention was drawn to a highly significant relation between the generation of anxiety and the formation of symptoms - namely, that these two represent and replace each other. For instance, an agoraphobic patient may start his illness with an attack of anxiety in the street. This would be repeated every time he went into the street again. He will now develop the symptom of agoraphobia; this may also be described as an inhibition, a restriction of the ego's functioning, and by means of it he spares himself anxiety attacks. We can witness the converse of this if we interfere in the formation of symptoms, as is possible, for instance, with obsessions. If we prevent a patient from carrying out a washing ceremonial, he falls into a state of anxiety which he finds hard to tolerate and from which he had evidently been protected by his symptom. And it seems, indeed, that the generation of anxiety is the earlier and the formation of symptoms the later of the two, as though the symptoms are created in order to avoid the outbreak of the anxiety state. This is confirmed too by the fact that the first neuroses of childhood are phobias - states in which we see so clearly how an initial generation of anxiety is replaced by the later formation of a symptom; we get an impression that it is from these interrelations that we shall best obtain access to an understanding of neurotic anxiety. And at the same time we have also succeeded in answering the question of what it is that a person is afraid of in neurotic anxiety and so in establishing the connection between neurotic and realistic anxiety. What he is afraid of is evidently his own libido. The difference between this situation and that of realistic anxiety lies in two points: that the danger is an internal instead of an external one and that it is not consciously recognized.

In phobias it is very easy to observe the way in which this internal danger is transformed into an external one - that is to say, how a neurotic anxiety is changed into an apparently realistic one. In order to simplify what is often a very complicated business, let us suppose that the agoraphobic patient is invariably afraid of feelings of temptation that are aroused in him by meeting people in the street. In his phobia he brings about a displacement and henceforward is afraid of an external situation. What he gains by this is obviously that he thinks he will be able to protect himself better in that way. One can save oneself from an external danger by flight; fleeing from an internal danger is a difficult enterprise.

At the conclusion of my earlier lecture on anxiety I myself expressed the opinion that, although these various findings of our enquiry were not mutually contradictory, somehow they did not fit in with one another. Anxiety, it seems, in so far as it is an affective state, is the reproduction of an old event which brought a threat of danger; anxiety serves the purposes of self-preservation and is a signal of a new danger; it arises from libido that has in some way become unemployable and it also arises during the process of repression; it is replaced by the formation of a symptom, is, as it were, psychically bound - one has a feeling that something is missing here which would bring all these pieces together into a whole.

Ladies and Gentlemen, the dissection of the mental personality into a super-ego, an ego and an id, which I put before you in my last lecture, has obliged us to take our bearings afresh in the problem of anxiety as well. With the thesis that the ego is the sole seat of anxiety - that the ego alone can produce and feel anxiety - we have established a new and stable position from which a number of things take on a new aspect. And indeed it is difficult to see what sense there would be in speaking of an 'anxiety of the id' or in attributing a capacity for apprehensiveness to the super-ego. On the other hand, we have welcomed a desirable element of correspondence in the fact that the three main species of anxiety, realistic, neurotic and moral, can be so easily connected with the ego's three dependent relations - to the external world, to the id and to the super-ego. Along with this new view, moreover, the function of anxiety as a signal announcing a situation of danger (a notion, incidentally, not unfamiliar to us) comes into prominence, the question of what the material is out of which anxiety is made loses interest, and the relations between realistic and neurotic anxiety have become surprisingly clarified and simplified. It is also to be remarked that we now understand the apparently complicated cases of the generation of anxiety better than those which were considered simple.

For we have recently been examining the way in which anxiety is generated in certain phobias which we class as anxiety hysteria, and have chosen cases in which we were dealing with the typical repression of wishful impulses arising from the Oedipus complex. We should have expected to find that it was a libidinal cathexis of the boy's mother as object which, as a result of repression, had been changed into anxiety and which now emerged, expressed in symptomatic terms, attached to a substitute for his father. I cannot present you with the detailed steps of an investigation such as this; it will be enough to say that the surprising result was the opposite of what we expected. It was not the repression that created the anxiety; the anxiety was there earlier; it was the anxiety that made the repression. But what sort of anxiety can it have been? Only anxiety in the face of a threatening external danger - that is to say, a realistic anxiety. It is true that the boy felt anxiety in the face of a demand by his libido - in this instance, anxiety at being in love with his mother; so the case was in fact one of neurotic anxiety. But this being in love only appeared to him as an internal danger, which he must avoid by renouncing that object, because it conjured up an external situation of danger. And in every case we examine we obtain the same result. It must be confessed that we were not prepared to find that internal instinctual danger would turn out to be a determinant and preparation for an external, real, situation of danger.

But we have not made any mention at all so far of what the real danger is that the child is afraid of as a result of being in love with his mother. The danger is the punishment of being castrated, of losing his genital organ. You will of course object that after all that is not a real danger. Our boys are not castrated because they are in love with their mothers during the phase of the Oedipus complex. But the matter cannot be dismissed so simply. Above all, it is not a question of whether castration is really carried out; what is decisive is that the danger is one that threatens from outside and that the child believes in it. He has some ground for this, for people threaten him often enough with cutting off his penis during the phallic phase, at the time of his early masturbation, and hints at that punishment must regularly find a phylogenetic reinforcement in him. It is our suspicion that during the human family's primaeval period castration used actually to be carried out by a jealous and cruel father upon growing boys, and that circumcision, which so frequently plays a part in puberty rites among primitive peoples, is a clearly recognizable relic of it. We are aware that here we are diverging widely from the general opinion; but we must hold fast to the view that fear of castration is one of the commonest and strongest motives for repression and thus for the formation of neuroses. The analysis of cases in which circumcision, though not, it is true, castration, has been carried out on boys as a cure or punishment for masturbation (a far from rare occurrence in Anglo-American society) has given our conviction a last degree of certainty. It is very tempting at this point to go more deeply into the castration complex, but I will stick to our subject.

Fear of castration is not, of course, the only motive for repression: indeed, it finds no place in women, for though they have a castration complex they cannot have a fear of being castrated. Its place is taken in their sex by a fear of loss of love, which is evidently a later prolongation of the infant's anxiety if it finds its mother absent. You will realize how real a situation of danger is indicated by this anxiety. If a mother is absent or has withdrawn her love from her child, it is no longer sure of the satisfaction of its needs and is perhaps exposed to the most distressing feelings of tension. Do not reject the idea that these determinants of anxiety may at bottom repeat the situation of the original anxiety at birth, which, to be sure, also represented a separation from the mother. Indeed, if you follow a train of thought suggested by Ferenczi, you may add the fear of castration to this series, for a loss of the male organ results in an inability to unite once more with the mother (or a substitute for her) in the sexual act. I may mention to you incidentally that the very frequent phantasy of returning into the mother's womb is a substitute for this wish to copulate. There would be many interesting things and surprising connections to tell you at this point, but I cannot go outside the framework of an introduction to psycho-analysis. I will only draw your attention to the fact that here psychological researches trench upon the facts of biology.

Otto Rank, to whom psycho-analysis is indebted for many excellent contributions, also has the merit of having expressly emphasized the significance of the act of birth and of separation from the mother. Nevertheless we have all found it impossible to accept the extreme inferences which he has drawn from this factor as bearing on the theory of the neuroses and even on analytic therapy. The core of his theory - that the experience of anxiety at birth is the model of all later situations of danger - he found already there. If we dwell on these situations of danger for a moment, we can say that in fact a particular determinant of anxiety (that is, situation of danger) is allotted to every age of development as being appropriate to it. The danger of psychical helplessness fits the stage of the ego's early immaturity; the danger of loss of an object (or loss of love) fits the lack of self-sufficiency in the first years of childhood; the danger of being castrated fits the phallic phase; and finally fear of the super-ego, which assumes a special position, fits the period of latency. In the course of development the old determinants of anxiety should be dropped, since the situations of danger corresponding to them have lost their importance owing to the strengthening of the ego. But this only occurs most incompletely. Many people are unable to surmount the fear of loss of love; they never become sufficiently independent of other people's love and in this respect carry on their behaviour as infants. Fear of the super-ego should normally never cease, since, in the form of moral anxiety, it is indispensable in social relations, and only in the rarest cases can an individual become independent of human society. A few of the old situations of danger, too, succeed in surviving into later periods by making contemporary modifications in their determinants of anxiety. Thus, for instance, the danger of castration persists under the mark of syphilidophobia. It is true that as an adult one knows that castration is no longer customary as a punishment for the indulgence of sexual desires, but on the other hand one has learnt that instinctual liberty of that kind is threatened by serious diseases. There is no doubt that the people we describe as neurotics remain infantile in their attitude to danger and have not surmounted obsolete determinants of anxiety. We may take this as a factual contribution to the characterization of neurotics; it is not so easy to say why it should be so.

I hope you have not lost the thread of what I am saying and remember that we are investigating the relations between anxiety and repression. In the course of this we have learnt two new things: first, that anxiety makes repression and not, as we used to think, the other way round, and that the instinctual situation which is feared goes back ultimately to an external situation of danger. The next question will be: how do we now picture the process of a repression under the influence of anxiety? The answer will, I think, be as follows. The ego notices that the satisfaction of an emerging instinctual demand would conjure up one of the well-remembered situations of danger. This instinctual cathexis must therefore be somehow suppressed, stopped, made powerless. We know that the ego succeeds in this task if it is strong and has drawn the instinctual impulse concerned into its organization. But what happens in the case of repression is that the instinctual impulse still belongs to the id and that the ego feels weak. The ego thereupon helps itself by a technique which is at bottom identical with normal thinking. Thinking is an experimental action carried out with small amounts of energy, in the same way as a general shifts small figures about on a map before setting his large bodies of troops in motion. Thus the ego anticipates the satisfaction of the questionable instinctual impulse and permits it to bring about the reproduction of the unpleasurable feelings at the beginning of the feared situation of danger. With this the automatism of the pleasure-unpleasure principle is brought into operation and now carries out the repression of the dangerous instinctual impulse.

‘Stop a moment!’ you will exclaim; ‘we can’t follow you any further there!’ You are quite right; I must add a little more before it can seem acceptable to you. First, I must admit that I have tried to translate into the language of our normal thinking what must in fact be a process that is neither conscious nor preconscious, taking place between quotas of energy in some unimaginable substratum. But that is not a strong objection, for it cannot be done in any other way. What is more important is that we should distinguish clearly what happens in the ego and what happens in the id when there is a repression. We have just said what the ego does: it makes use of an experimental cathexis and starts up the pleasure-unpleasure automatism by means of a signal of anxiety. After that, several reactions are possible or a combination of them in varying proportions. Either the anxiety attack is fully generated and the ego withdraws entirely from the objectionable excitation; or, in place of the experimental cathexis it opposes the excitation with an anticathexis, and this combines with the energy of the repressed impulse to form a symptom; or the anticathexis is taken up into the ego as a reaction-formation, as an intensification of certain of the ego’s dispositions, as a permanent alteration of it. The more the generation of anxiety can be restricted to a mere signal, so much the more does the ego expend on actions of defence which amount to the psychological binding of the repressed, and so much the closer, too, does the process approximate to a normal working-over of it, though no doubt without attaining to it.

Incidentally, here is a point on which we may dwell for a moment. You yourselves have no doubt assumed that what is known as 'character', a thing so hard to define, is to be ascribed entirely to the ego. We have already made out a little of what it is that creates character. First and foremost there is the incorporation of the former parental agency as a super-ego, which is no doubt its most important and decisive portion, and, further, identifications with the two parents of the later period and with other influential figures, and similar identifications formed as precipitates of abandoned object-relations. And we may now add as contributions to the construction of character which are never absent the reaction-formations which the ego acquires - to begin with in making its repressions and later, by a more normal method, when it rejects unwished-for instinctual impulses.

Now let us go back and turn to the id. It is not so easy to guess what occurs during repression in connection with the instinctual impulse that is being fought against. The main question which our interest raises is as to what happens to the energy, to the libidinal charge, of that excitation - how is it employed? You recollect that the earlier hypothesis was that it is precisely this that is transformed by repression into anxiety. We no longer feel able to say that. The modest reply will rather be that what happens to it is probably not always the same thing. There is probably an intimate correspondence which we ought to get to know about between what is occurring at the time in the ego and in the id in connection with the repressed impulse. For since we have decided that the pleasure-unpleasure principle, which is set in action by the signal of anxiety, plays a part in repression, we must alter our expectations. That principle exercises an entirely unrestricted dominance over what happens in the id. We can rely on its bringing about quite profound changes in the instinctual impulse in question. We are prepared to find that repression will have very various consequences, more or less far-reaching. In some cases the repressed instinctual impulse may retain its libidinal cathexis, and may persist in the id unchanged, although subject to constant pressure from the ego. In other cases what seems to happen is that it is totally destroyed, while its libido is permanently diverted along other paths. I expressed the view that this is what happens when the Oedipus complex is dealt with normally - in this desirable case, therefore, being not simply repressed but destroyed in the id. Clinical experience has further shown us that in many cases, instead of the customary result of repression, a degradation of the libido takes place - a regression of the libidinal organization to an earlier stage. This can, of course, only occur in the id, and if it occurs it will be under the influence of the same conflict which was introduced by the signal of anxiety. The most striking example of this kind is provided by the obsessional neurosis, in which libidinal regression and repression operate together.

I fear, Ladies and Gentlemen, that you will find this exposition hard to follow, and you will guess that I have not stated it exhaustively. I am sorry to have had to rouse your displeasure. But I can set myself no other aim than to give you an impression of the nature of our findings and of the difficulties involved in working them out. The deeper we penetrate into the study of mental processes the more we recognize their abundance and complexity. A number of simple formulas which to begin with seemed to meet our needs have later turned out to be inadequate. We do not tire of altering and improving them. In my lecture on the theory of dreams I introduced you to a region in which for fifteen years there has scarcely been a new discovery. Here, where we are dealing with anxiety, you see everything in a state of flux and change. These novelties, moreover, have not yet been thoroughly worked through and perhaps this too adds to the difficulties of demonstrating them. But have patience! We shall soon be able to take leave of the subject of anxiety. I cannot promise that it will have been settled to our satisfaction, but it is to be hoped that we shall have made a little bit of progress. And in the meantime we have made all sorts of new discoveries. Now, for instance, our study of anxiety leads us to add a new feature to our description of the ego. We have said that the ego is weak in comparison with the id, that it is its loyal servant, eager to carry out its orders and to fulfil its demands. We have no intention of withdrawing this statement. But on the other hand this same ego is the better organized part of the id, with its face turned towards reality. We must not exaggerate the separation between the two of them too much, and we must not be surprised if the ego on its part can bring its influence to bear on the processes in the id. I believe the ego exercises this influence by putting into action the almost omnipotent pleasure-unpleasure principle by means of the signal of anxiety. On the other hand, it shows its weakness again immediately afterwards, for by the act of repression it renounces a portion of its organization and has to allow the repressed instinctual impulse to remain permanently withdrawn from its influence.

And now, only one more remark on the problem of anxiety. Neurotic anxiety has changed in our hands into realistic anxiety, into fear of particular external situations of danger. But we cannot stop there, we must take another step - though it will be a step backward. We ask ourselves what it is that is actually dangerous and actually feared in a situation of danger of this kind. It is plainly not the injury to the subject as judged objectively, for this need be of no significance psychologically, but something brought about by it in the mind. Birth, for instance, our model for an anxiety state, can after all scarcely be regarded on its own account as an injury, although it may involve a danger of injuries. The essential thing about birth, as about every situation of danger, is that it calls up in mental experience a state of highly tense excitation, which is felt as unpleasure and which one is not able to master by discharging it. Let us call a state of this kind, before which the efforts of the pleasure principle break down, a 'traumatic' moment. Then, if we take in succession neurotic anxiety, realistic anxiety and the situation of danger, we arrive at this simple proposition: what is feared, what is the object of the anxiety, is invariably the emergence of a traumatic moment, which cannot be dealt with by the normal rules of the pleasure principle. We understand at once that our endowment with the pleasure principle does not guarantee us against objective injuries but only against a particular injury to our psychological economics. It is a long step from the pleasure principle to the self-preservative instinct; the intentions of the two of them are very far from coinciding from the start. But we see something else besides; perhaps it is the solution we are in search of. Namely, that in all this it is a question of relative quantities. It is only the magnitude of the sum of excitation that turns an impression into a traumatic moment, paralyses the function of the pleasure principle and gives the situation of danger its significance. And if that is how things are, if these puzzles can be solved so prosaically, why should it not be possible for similar traumatic moments to arise in mental life without reference to hypothetical situations of danger - traumatic moments, then, in which anxiety is not aroused as a signal but is generated anew for a fresh reason. Clinical experience declares decidedly that such is in fact the case. It is only the *later* repressions that exhibit the mechanism we have described, in which anxiety is awakened as a signal of an earlier situation of danger. The first and original repressions arise directly from traumatic moments, when the ego meets with an excessively great libidinal demand; they construct their anxiety afresh, although, it is true, on the model of birth. The same may apply to the generation of anxiety in anxiety neurosis owing to somatic damage to the sexual function. We shall no longer maintain that it is the libido itself that is turned into anxiety in such cases. But I can see no objection to there being a twofold origin of anxiety - one as a direct consequence of the traumatic moment and the other as a signal threatening a repetition of such a moment.

I feel sure you are rejoicing, Ladies and Gentlemen, at not having to listen to any more about anxiety. But you have gained nothing by it: what follows is no better. It is my design to introduce you to-day as well to the field of the libido theory or theory of the instincts, where there have equally been a number of new developments. I will not claim that we have made great advances in it, so that it would be worth your taking any amount of trouble to learn about them. No. This is a region in which we are struggling laboriously to find our bearings and make discoveries; you will only be witnesses of our efforts. Here too I shall have to go back to some of the things I told you earlier.

The theory of the instincts is so to say our mythology. Instincts are mythical entities, magnificent in their indefiniteness. In our work we cannot for a moment disregard them, yet we are never sure that we are seeing them clearly. You know how popular thinking deals with the instincts. People assume as many and as various instincts as they happen to need at the moment - a self-assertive instinct, an imitative instinct, an instinct of play, a gregarious instinct and many others like them. People take them up, as it were, make each of them do its particular job, and then drop them again. We have always been moved by a suspicion that behind all these little *ad hoc* instincts there lay concealed something serious and powerful which we should like to approach cautiously. Our first step was modest enough. We told ourselves we should probably not be going astray if we began by separating two main instincts or classes of instincts or groups of instincts in accordance with the two great needs - hunger and love. However jealously we usually defend the independence of psychology from every other science, here we stood in the shadow of the unshakable biological fact that the living individual organism is at the command of two intentions, self-preservation and the preservation of the species, which seem to be independent of each other, which, so far as we know at present, have no common origin and whose interests are often in conflict in animal life. Actually what we are talking now is biological psychology, we are studying the psychical accompaniments of biological processes. It was as representing this aspect of the subject that the 'ego-instincts' and the 'sexual instincts' were introduced into psycho-analysis. We included in the former everything that had to do with the preservation, assertion and magnification of the individual. To the latter we had to attribute the copiousness called for by infantile and perverse sexual life. In the course of investigating the neuroses we came to know the ego as the restricting and repressing power and the sexual trends as the restricted and repressed one; we therefore believed that we had clear evidence not only of the difference between the two groups of instincts but also of the conflict between them. The first object of our study was only the sexual instincts, whose energy we named 'libido'. It was in relation to them that we sought to clarify our ideas of what an instinct is and what is to be attributed to it. Here we have the libido theory.

An instinct, then, is distinguished from a stimulus by the fact that it arises from sources of stimulation within the body, that it operates as a constant force and that the subject cannot avoid it by flight, as is possible with an external stimulus. We can distinguish an instinct's source, object and aim. Its source is a state of excitation in the body, its aim is the removal of that excitation; on its path from its source to its aim the instinct becomes operative psychically. We picture it as a certain quota of energy which presses in a particular direction. It is from this pressing that it derives its name of '*Trieb*'. People speak of 'active' and 'passive' instincts, but it would be more correct to speak of instincts with active and passive aims: for an expenditure of activity is needed to achieve a passive aim as well. The aim can be achieved in the subject's own body; as a rule an external object is brought in, in regard to which the instinct achieves its external aim; its internal aim invariably remains the bodily change which is felt as satisfaction. It has not become clear to us whether the relation of the instinct to its somatic source gives it a specific quality and if so what. The evidence of analytic experience shows that it is an undoubted fact that instinctual impulses from one source attach themselves to those from other sources and share their further vicissitudes and that in general one instinctual satisfaction can be replaced by another. But it must be admitted that we do not understand this very well. The relations of an instinct to its aim and object are also open to alterations; both can be exchanged for other ones, though its relation to its object is nevertheless the more easily loosened. A certain kind of modification of the aim and change of the object, in which our social valuation is taken into account, is described by us as 'sublimation'. Besides this, we have grounds for distinguishing instincts which are 'inhibited in their aim' - instinctual impulses from sources well known to us with an unambiguous aim, but which come to a stop on their way to satisfaction, so that a lasting object-cathexis comes about and a permanent trend. Such, for instance, is the relation of tenderness, which undoubtedly originates from the sources of sexual need and invariably renounces its satisfaction.

You see how many of the characteristics and vicissitudes of the instincts still escape our comprehension. A further distinction should be mentioned here which is exhibited between the sexual and self-preservative instincts and which would be of the greatest theoretical importance if it applied to the groups as a whole. The sexual instincts are noticeable to us for their plasticity, their capacity for altering their aims, their replaceability, which admits of one instinctual satisfaction being replaced by another, and their readiness for being deferred, of which we have just given a good example in the aim-inhibited instincts. We should be glad to deny these characteristics to the self-preservative instincts, and to say of them that they are inflexible, admit of no delay, are imperative in a very different sense and have a quite other relation to repression and to anxiety. But a little reflection tells us that this exceptional position applies, not to all the ego-instincts, but only to hunger and thirst, and is evidently based on a peculiar character of the sources of those instincts. A good part of the confusing impression made by all this is that we have not given separate consideration to the alterations which the influence of the organized ego makes in the instinctual impulses that belonged originally to the id.

We find ourselves on firmer ground when we investigate the manner in which the life of the instincts serves the sexual function. Here we have acquired quite definite knowledge, with which you too are already familiar. It is not the case, then, that we recognize a sexual instinct which is from the first the vehicle of an urge towards the aim of the sexual function - the union of the two sex-cells. What we see is a great number of component instincts arising from different areas and regions of the body, which strive for satisfaction fairly independently of one another and find that satisfaction in something that we may call 'organ-pleasure'. The genitals are the latest of these 'erotogenic zones' and the name of 'sexual' pleasure cannot be withheld from their organ-pleasure. These impulses which strive for pleasure are not all taken up into the final organization of the sexual function. A number of them are set aside as unserviceable, by repression or some other means; a few of them are diverted from their aim in the remarkable manner I have mentioned and used to strengthen other impulses; yet others persist in minor roles, and serve for the performance of introductory acts, for the production of fore-pleasure. You have heard how in the course of this long-drawn-out development several phases of preliminary organization can be recognized and also how this history of the sexual function explains its aberrations and atrophies. The first of these 'pregenital' phases is known to us as the *oral* one because, in conformity with the way in which an infant in arms is nourished, the erotogenic zone of the mouth dominates what may be called the sexual activity of that period of life. At a second level the *sadistic* and *anal* impulses come to the fore, undoubtedly in connection with the appearance of the teeth, the strengthening of the muscular apparatus and the control of the sphincter functions. We have learnt a number of interesting details about this remarkable stage of development in particular. Thirdly comes the *phallic* phase in which in both sexes the male organ (and what corresponds to it in girls) attains an importance which can no longer be overlooked. We have reserved the name of *genital* phase for the definitive sexual organization which is established after puberty and in which the female genital organ for the first time meets with the recognition which the male one acquired long before.

So far all this is trite repetition. And you must not suppose that the many things I have not mentioned this time no longer hold good. This repetition was necessary so that I might use it as the starting-point for a report on the advances in our knowledge. We can boast of having learnt much that is new, particularly about the early organizations of the libido, and of having obtained a clearer grasp of the significance of what is old; and I will give you at least a few examples to demonstrate this. Abraham showed in 1924 that two stages can be distinguished in the sadistic-anal phase. The earlier of these is dominated by the destructive trends of destroying and losing, the later one by trends friendly towards objects - those of keeping and possessing. It is in the middle of this phase, therefore, that consideration for the object makes its first appearance as a precursor of a later erotic cathexis. We are equally justified in making a similar subdivision in the first, oral phase. In the first sub-stage what is in question is only oral incorporation, there is no ambivalence at all in the relation to the object - the mother's breast. The second stage, characterized by the emergence of the biting activity, may be described as the 'oral-sadistic' one; it exhibits for the first time the phenomena of ambivalence, which become so much clearer afterwards, in the following sadistic-anal phase. The value of these new distinctions is to be seen especially if we look for the dispositional points in the development of the libido in the case of particular neuroses, such as obsessional neurosis or melancholia. You must here recall to mind what we have learnt about the connection between fixation of the libido, disposition and regression.

Our attitude to the phases of the organization of the libido has in general shifted a little. Whereas earlier we chiefly emphasized the way in which each of them passed away before the next, our attention now is directed to the facts that show us how much of each earlier phase persists alongside of and behind the later configurations and obtains a permanent representation in the libidinal economy and character of the subject. Still more significant have studies become which have taught us how frequently under pathological conditions regressions to earlier phases occur and that particular regressions are characteristic of particular forms of illness. But I cannot go into that here, it forms part of the specialized psychology of the neuroses.

We have been able to study transformations of instinct and similar processes particularly in anal erotism, the excitations arising from the sources of the erotogenic anal zone, and we were surprised at the multiplicity of uses to which these instinctual impulses are put. It may not be easy, perhaps, to get free from the contempt into which this particular zone has fallen in the course of evolution. Let us therefore allow ourselves to be reminded by Abraham that embryologically the anus corresponds to the primitive mouth, which has migrated down to the end of the bowel. We have learnt, then, that after a person's own faeces, his excrement, has lost its value for him, this instinctual interest derived from the anal source passes over on to objects that can be presented as *gifts*. And this is rightly so, for faeces were the first gift that an infant could make, something he could part with out of love for whoever was looking after him. After this, corresponding exactly to analogous changes of meaning that occur in linguistic development, this ancient interest in faeces is transformed into the high valuation of *gold* and *money* but also makes a contribution to the affective cathexis of *baby* and *penis*. It is a universal conviction among children, who long retain the cloaca theory, that babies are born from the bowel like a piece of faeces: defaecation is the model of the act of birth. But the penis too has its fore-runner in the column of faeces which fills and stimulates the mucous membrane of the bowel. When a child, unwillingly enough, comes to realize that there are human creatures who do not possess a penis, that organ appears to him as something detachable from the body and becomes unmistakably analogous to the excrement, which was the first piece of bodily material that had to be renounced. A great part of anal erotism is thus carried over into a cathexis of the penis. But the interest in that part of the body has, in addition to its anal-erotic root, an oral one which is perhaps more powerful still: for when sucking has come to an end, the penis also becomes heir of the mother's nipple.

If one is not aware of these profound connections, it is impossible to find one's way about in the phantasies of human beings, in their associations, influenced as they are by the unconscious, and in their symptomatic language. Faeces - money - gift - baby - penis are treated there as though they meant the same thing, and they are represented too by the same symbols. Nor must you forget that I have only been able to give you very incomplete information. I may hurriedly add, perhaps, that interest in the vagina, which awakens later, is also essentially of anal-erotic origin. This is not to be wondered at, for the vagina itself, to borrow an apt phrase from Lou Andreas-Salomé, is 'taken on lease' from the rectum: in the life of homosexuals, who have failed to accomplish some part of normal sexual development, the vagina is once more represented by it. In dreams a locality often appears which was earlier a simple room but is now divided into two by a wall, or the other way round. This always means the relation of the vagina to the bowel. It is also easy to follow the way in which in girls what is an entirely unfeminine wish to possess a penis is normally transformed into a wish for a baby, and then for a man as the bearer of the penis and giver of the baby; so that here we can see too how a portion of what was originally anal-erotic interest obtains admission into the later genital organization.

During our studies of the pregenital phases of the libido we have also gained a few fresh insights into the formation of character. We noticed a triad of character-traits which are found together with fair regularity: orderliness, parsimoniousness and obstinacy; and we inferred from the analysis of people exhibiting these traits that they have arisen from their anal erotism becoming absorbed and employed in a different way. We therefore speak of an 'anal character' in which we find this remarkable combination and we draw a contrast to some extent between the anal character and unmodified anal erotism. We also discovered a similar but perhaps still firmer link between ambition and urethral erotism. A striking allusion to this connection is to be seen in the legend that Alexander the Great was born during the same night in which a certain Herostratus set fire to the celebrated temple of Artemis at Ephesus out of a sheer desire for fame. So the ancients would seem not to have been unaware of the connection. You know, of course, how much urination has to do with fire and extinguishing fire. We naturally expect that other character traits as well will turn out similarly to be precipitates or reaction-formations related to particular pregenital libidinal structures; but we have not yet been able to show this.

It is now time, however, for me to go back both in history and in my subject-matter and once more to take up the most general problems of instinctual life. To begin with, the opposition between the ego-instincts and the sexual instincts lay at the base of our libido theory. When later on we began to study the ego itself more closely and arrived at the conception of narcissism, this distinction itself lost its foundation. In rare cases one can observe that the ego has taken itself as an object and is behaving as though it were in love with itself. Hence the term 'narcissism', borrowed from the Greek myth. But that is only an extreme exaggeration of a normal state of affairs. We came to understand that the ego is always the main reservoir of libido, from which libidinal cathexes of objects go out and into which they return again, while the major part of this libido remains permanently in the ego. Thus ego-libido is being constantly changed into object-libido and object-libido into ego-libido. But in that case they could not be different in their nature and it could have no sense to distinguish the energy of the one from the energy of the other; we could either drop the term 'libido' or use it as synonymous with psychical energy in general.

We did not maintain this position for long. Our feeling of their being a contrariety in instinctual life soon found another and sharper expression. It is not my wish, however, to put before you the origin of this novelty in the theory of the instincts; it too is based essentially on biological considerations. I shall offer it to you as a ready-made product. Our hypothesis is that there are two essentially different classes of instincts: the sexual instincts, understood in the widest sense - Eros, if you prefer that name - and the aggressive instincts, whose aim is destruction. When it is put to you like this, you will scarcely regard it as a novelty. It looks like an attempt at a theoretical transfiguration of the commonplace opposition between loving and hating, which coincides, perhaps, with the other polarity, of attraction and repulsion, which physics assumes in the inorganic world. But it is a remarkable thing that this hypothesis is nevertheless felt by many people as an innovation and, indeed, as a most undesirable one which should be got rid of as quickly as possible. I presume that a strong affective factor is coming into effect in this rejection. Why have we ourselves needed such a long time before we decided to recognize an aggressive instinct? Why did we hesitate to make use, on behalf of our theory, of facts which were obvious and familiar to everyone? We should probably have met with little resistance if we had wanted to ascribe an instinct with such an aim to animals. But to include it in the human constitution appears sacrilegious; it contradicts too many religious presumptions and social conventions. No, man must be naturally good or at least good-natured. If he occasionally shows himself brutal, violent or cruel, these are only passing disturbances of his emotional life, for the most part provoked, or perhaps only consequences of the inexpedient social regulations which he has hitherto imposed on himself.

Unfortunately what history tells us and what we ourselves have experienced does not speak in this sense but rather justifies a judgement that belief in the 'goodness' of human nature is one of those evil illusions by which mankind expect their lives to be beautified and made easier while in reality they only cause damage. We need not continue this controversy, since we have argued in favour of a special aggressive and destructive instinct in men not on account of the teachings of history or of our experience in life but on the basis of general considerations to which we were led by examining the phenomena of sadism and masochism. As you know, we call it sadism when sexual satisfaction is linked to the condition of the sexual object's suffering pain, ill-treatment and humiliation, and masochism when the need is felt of being the ill-treated object oneself. As you know too, a certain admixture of these two trends is included in normal sexual relations, and we speak of perversions when they push the other sexual aims into the background and replace them by their own aims. And you will scarcely have failed to notice that sadism has a more intimate relation with masculinity and masochism with femininity, as though there were a secret kinship present; though I must add that we have made no progress along that path. Both phenomena, sadism and masochism alike, but masochism quite especially, present a truly puzzling problem to the libido theory; and it is only proper if what was a stumbling-block for the one theory should become the cornerstone of the theory replacing it.

It is our opinion, then, that in sadism and in masochism we have before us two excellent examples of a mixture of the two classes of instinct, of Eros and aggressiveness; and we proceed to the hypothesis that this relation is a model one - that every instinctual impulse that we can examine consists of similar fusions or alloys of the two classes of instinct. These fusions, of course, would be in the most varied ratios. Thus the erotic instincts would introduce the multiplicity of their sexual aims into the fusion, while the others would only admit of mitigations or gradations in their monotonous trend. This hypothesis opens a prospect to us of investigations which may some day be of great importance for the understanding of pathological processes. For fusions may also come apart, and we may expect that functioning will be most gravely affected by defusions of such a kind. But these conceptions are still too new; no one has yet tried to apply them in our work.

Let us go back to the special problem presented to us by masochism. If for a moment we leave its erotic components on one side, it affords us a guarantee of the existence of a trend that has self-destruction as its aim. If it is true of the destructive instinct as well that the ego - but what we have in mind here is rather the id, the whole person - originally includes all the instinctual impulses, we are led to the view that masochism is older than sadism, and that sadism is the destructive instinct directed outwards, thus acquiring the characteristic of aggressiveness. A certain amount of the original destructive instinct may still remain in the interior. It seems that we can only perceive it under two conditions: if it is combined with erotic instincts into masochism or if - with a greater or lesser erotic addition - it is directed against the external world as aggressiveness. And now we are struck by the significance of the possibility that the aggressiveness may not be able to find satisfaction in the external world because it comes up against real obstacles. If this happens, it will perhaps retreat and increase the amount of self-destructiveness holding sway in the interior. We shall hear how this is in fact what occurs and how important a process this is. Impeded aggressiveness seems to involve a grave injury. It really seems as though it is necessary for us to destroy some other thing or person in order not to destroy ourselves, in order to guard against the impulsion to self-destruction. A sad disclosure indeed for the moralist!

But the moralist will console himself for a long time to come with the improbability of our speculations. A queer instinct indeed, directed to the destruction of its own organic home! Poets, it is true, talk of such things; but poets are irresponsible people and enjoy the privilege of poetic licence. Incidentally, such ideas are not foreign even to physiology: consider the notion, for instance, of the mucous membrane of the stomach digesting itself. It must be admitted, however, that our self-destructive instinct calls for support on a wider basis. One cannot, after all, venture on a hypothesis of such a wide range merely because a few poor fools have linked their sexual satisfaction to a peculiar condition. A more profound study of the instincts will, I believe, give us what we need. The instincts rule not only mental but also vegetative life, and these organic instincts exhibit a characteristic which deserves our deepest interest. (We shall not be able to judge until later whether it is a general characteristic of instincts.) For they reveal an effort to restore an earlier state of things. We may suppose that from the moment at which a state of things that has once been attained is upset, an instinct arises to create it afresh and brings about phenomena which we can describe as a 'compulsion to repeat'. Thus the whole of embryology is an example of the compulsion to repeat. A power of regenerating lost organs extends far up into the animal kingdom, and the instinct for recovery to which, alongside of therapeutic assistance, our cures are due must be the residue of this capacity which is so enormously developed in the lower animals. The spawning migrations of fishes, the migratory flights of birds, and possibly all that we describe as manifestations of instinct in animals, take place under the orders of the compulsion to repeat, which expresses the *conservative nature* of the instincts. Nor have we far to look in the mental field for its manifestations. We have been struck by the fact that the forgotten and repressed experiences of childhood are reproduced during the work of analysis in dreams and reactions, particularly in those occurring in the transference, although their revival runs counter to the interest of the pleasure principle; and we have explained this by supposing that in these cases a compulsion to repeat is overcoming even the pleasure principle. Outside analysis, too, something similar can be observed. There are people in whose lives the same reactions are perpetually being repeated uncorrected, to their own detriment, or others who seem to be pursued by a relentless fate, though closer investigation teaches us that they are unwittingly bringing this fate on themselves. In such cases we attribute a 'daemonic' character to the compulsion to repeat.

But how can this conservative characteristic of instincts help us to understand our self-destructiveness? What earlier state of things does an instinct such as this want to restore? Well, the answer is not far to seek and opens wide perspectives. If it is true that - at some immeasurably remote time and in a manner we cannot conceive - life once proceeded out of inorganic matter, then, according to our presumption, an instinct must have arisen which sought to do away with life once more and to re-establish the inorganic state. If we recognize in this instinct the self-destructiveness of our hypothesis, we may regard the self-destructiveness as an expression of a 'death instinct' which cannot fail to be present in every vital process. And now the instincts that we believe in divide themselves into two groups - the erotic instincts, which seek to combine more and more living substance into ever greater unities, and the death instincts, which oppose this effort and lead what is living back into an inorganic state. From the concurrent and opposing action of these two proceed the phenomena of life which are brought to an end by death.

You may perhaps shrug your shoulders and say: 'That isn't natural science, it's Schopenhauer's philosophy!' But, Ladies and Gentlemen, why should not a bold thinker have guessed something that is afterwards confirmed by sober and painstaking detailed research? Moreover, there is nothing that has not been said already, and similar things had been said by many people before Schopenhauer. Furthermore, what we are saying is not even genuine Schopenhauer. We are not asserting that death is the only aim of life; we are not overlooking the fact that there is life as well as death. We recognize two basic instincts and give each of them its own aim. How the two of them are mingled in the process of living, how the death instinct is made to serve the purposes of Eros, especially by being turned outwards as aggressiveness - these are tasks which are left to future investigation. We have not gone beyond the point at which this prospect lies open before us. The question, too, of whether the conservative character may not belong to all instincts without exception, whether the erotic instincts as well may not be seeking to bring back an earlier state of things when they strive to bring about a synthesis of living things into greater unities - this question, too, we must leave unanswered.

We have travelled somewhat far from our basis. I will tell you in retrospect the starting-point of these reflections on the theory of the instincts. It was the same as that which led us to revise the relation between the ego and the unconscious - the impression derived from the work of analysis that the patient who puts up a resistance is so often unaware of that resistance. Not only the fact of the resistance is unconscious to him, however, but its motives as well. We were obliged to search out these motives or motive, and to our surprise we found them in a powerful need for punishment which we could only class with masochistic wishes. The practical significance of this discovery is not less than its theoretical one, for the need for punishment is the worst enemy of our therapeutic efforts. It is satisfied by the suffering which is linked to the neurosis, and for that reason holds fast to being ill. It seems that this factor, an unconscious need for punishment, has a share in every neurotic illness. And here those cases in which the neurotic suffering can be replaced by suffering of another kind are wholly convincing. I will report an experience of this kind.

I once succeeded in freeing an unmarried woman, no longer young, from the complex of symptoms which had condemned her for some fifteen years to an existence of torment and had excluded her from any participation in life. She now felt she was well, and she plunged into eager activity, in order to develop her by no means small talent and to snatch a little recognition, enjoyment, and success, late though the moment was. But every one of her attempts ended either with people letting her know or with herself recognizing that she was too old to accomplish anything in that field. After each outcome of this kind a relapse into illness would have been the obvious thing, but she was no longer able to bring that about. Instead, she met each time with an accident which put her out of action for a time and caused her suffering. She fell down and sprained her ankle or hurt her knee, or she injured her hand in something she was doing. When she was made aware of how great her own share might be in these apparent accidents, she, so to say, changed her technique. Instead of accidents, indispositions appeared on the same provocations - catarrhs, sore throats, influenzal conditions, rheumatic swellings - till at last she made up her mind to resign her attempts and the whole agitation came to an end.

There is, as we think, no doubt about the origin of this unconscious need for punishment. It behaves like a piece of conscience, like a prolongation of our conscience into the unconscious; and it must have the same origin as conscience and correspond, therefore, to a piece of aggressiveness that has been internalized and taken over by the super-ego. If only the words went together better, we should be justified for all practical purposes in calling it an 'unconscious sense of guilt'. Theoretically we are in fact in doubt whether we should suppose that all the aggressiveness that has returned from the external world is bound by the super-ego and accordingly turned against the ego, or that a part of it is carrying on its mute and uncanny activity as a free destructive instinct in the ego and the id. A distribution of the latter kind is the more probable; but we know nothing more about it. There is no doubt that, when the super-ego was first instituted, in equipping that agency use was made of the piece of the child's aggressiveness towards his parents for which he was unable to effect a discharge outwards on account of his erotic fixation as well as of external difficulties; and for that reason the severity of the super-ego need not simply correspond to the strictness of the upbringing. It is very possible that, when there are later occasions for suppressing aggressiveness, the instinct may take the same path that was opened to it at that decisive point of time.

People in whom this unconscious sense of guilt is excessively strong betray themselves in analytic treatment by the negative therapeutic reaction which is so disagreeable from the prognostic point of view. When one has given them the solution of a symptom, which should normally be followed by at least its temporary disappearance, what they produce instead is a momentary exacerbation of the symptom and of the illness. It is often enough to praise them for their behaviour in the treatment or to say a few hopeful words about the progress of the analysis in order to bring about an unmistakable worsening of their condition. A non-analyst would say that the 'will to recovery' was absent. If you follow the analytic way of thinking, you will see in this behaviour a manifestation of the unconscious sense of guilt, for which being ill, with its sufferings and impediments, is just what is wanted. The problems which the unconscious sense of guilt has opened up, its connections with morality, education, crime and delinquency, are at present the preferred field of work for psycho-analysts.

And here, at an unexpected point, we have emerged from the psychical underworld into the open marketplace. I cannot lead you any further, but before I take leave of you for to-day I must detain you with one more train of thought. It has become our habit to say that our civilization has been built up at the cost of sexual trends which, being inhibited by society, are partly, it is true, repressed but have partly been made usable for other aims. We have admitted, too, that, in spite of all our pride in our cultural attainments, it is not easy for us to fulfil the requirements of this civilization or to feel comfortable in it, because the instinctual restrictions imposed on us constitute a heavy psychical burden. Well, what we have come to see about the sexual instincts, applies equally and perhaps still more to the other ones, the aggressive instincts. It is they above all that make human communal life difficult and threaten its survival. Restriction of the individual's aggressiveness is the first and perhaps the severest sacrifice which society requires of him. We have learnt the ingenious way in which the taming of this unruly thing has been achieved. The institution of the super-ego which takes over the dangerous aggressive impulses, introduces a garrison, as it were, into regions that are inclined to rebellion. But on the other hand, if we look at it purely psychologically, we must recognize that the ego does not feel happy in being thus sacrificed to the needs of society, in having to submit to the destructive trends of aggressiveness which it would have been glad to employ itself against others. It is like a prolongation in the mental sphere of the dilemma of 'eat or be eaten' which dominates the organic animate world. Luckily the aggressive instincts are never alone but always alloyed with the erotic ones. These latter have much to mitigate and much to avert under the conditions of the civilization which mankind has created.

LECTURE XXXIII

FEMININITY

LADIES AND GENTLEMEN, - All the while I am preparing to talk to you I am struggling with an internal difficulty. I feel uncertain, so to speak, of the extent of my licence. It is true that in the course of fifteen years of work psycho-analysis has changed and grown richer; but, in spite of that, an introduction to psycho-analysis might have been left without alteration or supplement. It is constantly in my mind that these lectures are without a *raison d'être*. For analysts I am saying too little and nothing at all that is new; but for you I am saying too much and saying things which you are not equipped to understand and which are not in your province. I have looked around for excuses and I have tried to justify each separate lecture on different grounds. The first one, on the theory of dreams, was supposed to put you back again at one blow into the analytic atmosphere and to show you how durable our views have turned out to be. I was led on to the second one, which followed the paths from dreams to what is called occultism, by the opportunity of speaking my mind without constraint on a department of work in which prejudiced expectations are fighting to-day against passionate resistances, and I could hope that your judgement, educated to tolerance on the example of psycho-analysis, would not refuse to accompany me on the excursion. The third lecture, on the dissection of the personality, certainly made the hardest demands upon you with its unfamiliar subject-matter; but it was impossible for me to keep this first beginning of an ego-psychology back from you, and if we had possessed it fifteen years ago I should have had to mention it to you then. My last lecture, finally, which you were probably able to follow only by great exertions, brought forward necessary corrections - fresh attempts at solving the most important conundrums; and my introduction would have been leading you astray if I had been silent about them. As you see, when one starts making excuses it turns out in the end that it was all inevitable, all the work of destiny. I submit to it, and I beg you to do the same.

To-day's lecture, too, should have no place in an introduction; but it may serve to give you an example of a detailed piece of analytic work, and I can say two things to recommend it. It brings forward nothing but observed facts, almost without any speculative additions, and it deals with a subject which has a claim on your interest second almost to no other. Throughout history people have knocked their heads against the riddle of the nature of femininity -

Häupter in Hieroglyphenmützen,
Häupter in Turban und schwarzem Barett,
Perückenhäupter und tausend andre
Arme, schwitzende Menschenhäupter. . . .¹

Nor will *you* have escaped worrying over this problem - those of you who are men; to those of you who are women this will not apply - you are yourselves the problem. When you meet a human being, the first distinction you make is 'male or female?' and you are accustomed to make the distinction with unhesitating certainty. Anatomical science shares your certainty at one point and not much further. The male sexual product, the spermatozoon, and its vehicle are male; the ovum and the organism that harbours it are female. In both sexes organs have been formed which serve exclusively for the sexual functions; they were probably developed from the same disposition into two different forms. Besides this, in both sexes the other organs, the bodily shapes and tissues, show the influence of the individual's sex, but this is inconstant and its amount variable; these are what are known as the secondary sexual characters. Science next tells you something that runs counter to your expectations and is probably calculated to confuse your feelings. It draws your attention to the fact that portions of the male sexual apparatus also appear in women's bodies, though in an atrophied state, and vice versa in the alternative case. It regards their occurrence as indications of *bisexuality*, as though an individual is not a man or a woman but always both - merely a certain amount more the one than the other. You will then be asked to make yourselves familiar with the idea that the proportion in which masculine and feminine are mixed in an individual is subject to quite considerable fluctuations. Since, however, apart from the very rarest cases, only one kind of sexual product - ova or semen - is nevertheless present in one person, you are bound to have doubts as to the decisive significance of those elements and must conclude that what constitutes masculinity or femininity is an unknown characteristic which anatomy cannot lay hold of.

¹ Heads in hieroglyphic bonnets,
Heads in turbans and black birettas,
Heads in wigs and thousand other
Wretched, sweating heads of humans....
(Heine, *Nordsee*.)

Can psychology do so perhaps? We are accustomed to employ 'masculine' and 'feminine' as mental qualities as well, and have in the same way transferred the notion of bisexuality to mental life. Thus we speak of a person, whether male or female, as behaving in a masculine way in one connection and in a feminine way in another. But you will soon perceive that this is only giving way to anatomy or to convention. You cannot give the concepts of 'masculine' and 'feminine' *any* new connotation. The distinction is not a psychological one; when you say 'masculine', you usually mean 'active', and when you say 'feminine', you usually mean 'passive'. Now it is true that a relation of the kind exists. The male sex-cell is actively mobile and searches out the female one, and the latter, the ovum, is immobile and waits passively. This behaviour of the elementary sexual organisms is indeed a model for the conduct of sexual individuals during intercourse. The male pursues the female for the purpose of sexual union, seizes hold of her and penetrates into her. But by this you have precisely reduced the characteristic of masculinity to the factor of aggressiveness so far as psychology is concerned. You may well doubt whether you have gained any real advantage from this when you reflect that in some classes of animals the females are the stronger and more aggressive and the male is active only in the single act of sexual union. This is so, for instance, with the spiders. Even the functions of rearing and caring for the young, which strike us as feminine *par excellence*, are not invariably attached to the female sex in animals. In quite high species we find that the sexes share the task of caring for the young between them or even that the male alone devotes himself to it. Even in the sphere of human sexual life you soon see how inadequate it is to make masculine behaviour coincide with activity and feminine with passivity. A mother is active in every sense towards her child; the act of lactation itself may equally be described as the mother suckling the baby or as her being sucked by it. The further you go from the narrow sexual sphere the more obvious will the 'error of superimposition' become. Women can display great activity in various directions, men are not able to live in company with their own kind unless they develop a large amount of passive adaptability. If you now tell me that these facts go to prove precisely that both men and women are bisexual in the psychological sense, I shall conclude that you have decided in your own minds to make 'active' coincide with 'masculine' and 'passive' with 'feminine'. But I advise you against it. It seems to me to serve no useful purpose and adds nothing to our knowledge.

One might consider characterizing femininity psychologically as giving preference to passive aims. This is not, of course, the same thing as passivity; to achieve a passive aim may call for a large amount of activity. It is perhaps the case that in a woman, on the basis of her share in the sexual function, a preference for passive behaviour and passive aims is carried over into her life to a greater or lesser extent, in proportion to the limits, restricted or far-reaching, within which her sexual life thus serves as a model. But we must beware in this of underestimating the influence of social customs, which similarly force women into passive situations. All this is still far from being cleared up. There is one particularly constant relation between femininity and instinctual life which we do not want to overlook. The suppression of women's aggressiveness which is prescribed for them constitutionally and imposed on them socially favours the development of powerful masochistic impulses, which succeed, as we know, in binding erotically the destructive trends which have been diverted inwards. Thus masochism, as people say, is truly feminine. But if, as happens so often, you meet with masochism in men, what is left to you but to say that these men exhibit very plain feminine traits?

And now you are already prepared to hear that psychology too is unable to solve the riddle of femininity. The explanation must no doubt come from elsewhere, and cannot come till we have learnt how in general the differentiation of living organisms into two sexes came about. We know nothing about it, yet the existence of two sexes is a most striking characteristic of organic life which distinguishes it sharply from inanimate nature. However, we find enough to study in those human individuals who, through the possession of female genitals, are characterized as manifestly or predominantly feminine. In conformity with its peculiar nature, psycho-analysis does not try to describe what a woman is - that would be a task it could scarcely perform - but sets about enquiring how she comes into being, how a woman develops out of a child with a bisexual disposition. In recent times we have begun to learn a little about this, thanks to the circumstance that several of our excellent women colleagues in analysis have begun to work at the question. The discussion of this has gained special attractiveness from the distinction between the sexes. For the ladies, whenever some comparison seemed to turn out unfavourable to their sex, were able to utter a suspicion that we, the male analysts, had been unable to overcome certain deeply-rooted prejudices against what was feminine, and that this was being paid for in the partiality of our researches. We, on the other hand, standing on the ground of bisexuality, had no difficulty in avoiding impoliteness. We had only to say: 'This doesn't apply to *you*. You're the exception; on this point you're more masculine than feminine.'

We approach the investigation of the sexual development of women with two expectations. The first is that here once more the constitution will not adapt itself to its function without a struggle. The second is that the decisive turning-points will already have been prepared for or completed before puberty. Both expectations are promptly confirmed. Furthermore, a comparison with what happens with boys tells us that the development of a little girl into a normal woman is more difficult and more complicated, since it includes two extra tasks, to which there is nothing corresponding in the development of a man. Let us follow the parallel lines from their beginning. Undoubtedly the material is different to start with in boys and girls: it did not need psycho-analysis to establish that. The difference in the structure of the genitals is accompanied by other bodily differences which are too well known to call for mention. Differences emerge too in the instinctual disposition which give a glimpse of the later nature of women. A little girl is as a rule less aggressive, defiant and self-sufficient; she seems to have a greater need for being shown affection and on that account to be more dependent and pliant. It is probably only as a result of this pliancy that she can be taught more easily and quicker to control her excretions: urine and faeces are the first gifts that children make to those who look after them, and controlling them is the first concession to which the instinctual life of children can be induced. One gets an impression, too, that little girls are more intelligent and livelier than boys of the same age; they go out more to meet the external world and at the same time form stronger object-cathexes. I cannot say whether this lead in development has been confirmed by exact observations, but in any case there is no question that girls cannot be described as intellectually backward. These sexual differences are not, however, of great consequence: they can be outweighed by individual variations. For our immediate purposes they can be disregarded.

Both sexes seem to pass through the early phases of libidinal development in the same manner. It might have been expected that in girls there would already have been some lag in aggressiveness in the sadistic-anal phase, but such is not the case. Analysis of children's play has shown our women analysts that the aggressive impulses of little girls leave nothing to be desired in the way of abundance and violence. With their entry into the phallic phase the differences between the sexes are completely eclipsed by their agreements. We are now obliged to recognize that the little girl is a little man. In boys, as we know, this phase is marked by the fact that they have learnt how to derive pleasurable sensations from their small penis and connect its excited state with their ideas of sexual intercourse. Little girls do the same thing with their still smaller clitoris. It seems that with them all their masturbatory acts are carried out on this penis-equivalent, and that the truly feminine vagina is still undiscovered by both sexes. It is true that there are a few isolated reports of early vaginal sensations as well, but it could not be easy to distinguish these from sensations in the anus or vestibulum; in any case they cannot play a great part. We are entitled to keep to our view that in the phallic phase of girls the clitoris is the leading erotogenic zone. But it is not, of course, going to remain so. With the change to femininity the clitoris should wholly or in part hand over its sensitivity, and at the same time its importance, to the vagina. This would be one of the two tasks which a woman has to perform in the course of her development, whereas the more fortunate man has only to continue at the time of his sexual maturity the activity that he has previously carried out at the period of the early efflorescence of his sexuality.

We shall return to the part played by the clitoris; let us now turn to the second task with which a girl's development is burdened. A boy's mother is the first object of his love, and she remains so too during the formation of his Oedipus complex and, in essence, all through his life. For a girl too her first object must be her mother (and the figures of wet-nurses and foster-mothers that merge into her). The first object-cathexes occur in attachment to the satisfaction of the major and simple vital needs, and the circumstances of the care of children are the same for both sexes. But in the Oedipus situation the girl's father has become her love-object, and we expect that in the normal course of development she will find her way from this paternal object to her final choice of an object. In the course of time, therefore, a girl has to change her erotogenic zone and her object - both of which a boy retains. The question then arises of how this happens: in particular, how does a girl pass from her mother to an attachment to her father? or, in other words, how does she pass from her masculine phase to the feminine one to which she is biologically destined?

It would be a solution of ideal simplicity if we could suppose that from a particular age onwards the elementary influence of the mutual attraction between the sexes makes itself felt and impels the small woman towards men, while the same law allows the boy to continue with his mother. We might suppose in addition that in this the children are following the pointer given them by the sexual preference of their parents. But we are not going to find things so easy; we scarcely know whether we are to believe seriously in the power of which poets talk so much and with such enthusiasm but which cannot be further dissected analytically. We have found an answer of quite another sort by means of laborious investigations, the material for which at least was easy to arrive at. For you must know that the number of women who remain till a late age tenderly dependent on a paternal object, or indeed on their real father, is very great. We have established some surprising facts about these women with an intense attachment of long duration to their father. We knew, of course, that there had been a preliminary stage of attachment to the mother, but we did not know that it could be so rich in content and so long-lasting, and could leave behind so many opportunities for fixations and dispositions. During this time the girl's father is only a troublesome rival; in some cases the attachment to her mother lasts beyond the fourth year of life. Almost everything that we find later in her relation to her father was already present in this earlier attachment and has been transferred subsequently on to her father. In short, we get an impression that we cannot understand women unless we appreciate this phase of their pre-Oedipus attachment to their mother.

We shall be glad, then, to know the nature of the girl's libidinal relations to her mother. The answer is that they are of very many different kinds. Since they persist through all three phases of infantile sexuality, they also take on the characteristics of the different phases and express themselves by oral, sadistic-anal and phallic wishes. These wishes represent active as well as passive impulses; if we relate them to the differentiation of the sexes which is to appear later - though we should avoid doing so as far as possible - we may call them masculine and feminine. Besides this, they are completely ambivalent, both affectionate and of a hostile and aggressive nature. The latter often only come to light after being changed into anxiety ideas. It is not always easy to point to a formulation of these early sexual wishes; what is most clearly expressed is a wish to get the mother with child and the corresponding wish to bear her a child - both belonging to the phallic period and sufficiently surprising, but established beyond doubt by analytic observation. The attractiveness of these investigations lies in the surprising detailed findings which they bring us. Thus, for instance, we discover the fear of being murdered or poisoned, which may later form the core of a paranoid illness, already present in this pre-Oedipus period, in relation to the mother. Or another case: you will recall an interesting episode in the history of analytic research which caused me many distressing hours. In the period in which the main interest was directed to discovering infantile sexual traumas, almost all my women patients told me that they had been seduced by their father. I was driven to recognize in the end that these reports were untrue and so came to understand that hysterical symptoms are derived from phantasies and not from real occurrences. It was only later that I was able to recognize in this fantasy of being seduced by the father the expression of the typical Oedipus complex in women. And now we find the fantasy of seduction once more in the pre-Oedipus prehistory of girls; but the seducer is regularly the mother. Here, however, the fantasy touches the ground of reality, for it was really the mother who by her activities over the child's bodily hygiene inevitably stimulated, and perhaps even roused for the first time, pleasurable sensations in her genitals.

I have no doubt you are ready to suspect that this portrayal of the abundance and strength of a little girl's sexual relations with her mother is very much overdrawn. After all, one has opportunities of seeing little girls and notices nothing of the sort. But the objection is not to the point. Enough can be seen in the children if one knows how to look. And besides, you should consider how little of its sexual wishes a child can bring to preconscious expression or communicate at all. Accordingly we are only within our rights if we study the residues and consequences of this emotional world in retrospect, in people in whom these processes of development had attained a specially clear and even excessive degree of expansion. Pathology has always done us the service of making discernible by isolation and exaggeration conditions which would remain concealed in a normal state. And since our investigations have been carried out on people who were by no means seriously abnormal, I think we should regard their outcome as deserving belief.

We will now turn our interest on to the single question of what it is that brings this powerful attachment of the girl to her mother to an end. This, as we know, is its usual fate: it is destined to make room for an attachment to her father. Here we come upon a fact which is a pointer to our further advance. This step in development does not involve only a simple change of object. The turning away from the mother is accompanied by hostility; the attachment to the mother ends in hate. A hate of that kind may become very striking and last all through life; it may be carefully overcompensated later on; as a rule one part of it is overcome while another part persists. Events of later years naturally influence this greatly. We will restrict ourselves, however, to studying it at the time at which the girl turns to her father and to enquiring into the motives for it. We are then given a long list of accusations and grievances against the mother which are supposed to justify the child's hostile feelings; they are of varying validity which we shall not fail to examine. A number of them are obvious rationalizations and the true sources of enmity remain to be found. I hope you will be interested if on this occasion I take you through all the details of a psycho-analytic investigation.

The reproach against the mother which goes back furthest is that she gave the child too little milk - which is construed against her as lack of love. Now there is some justification for this reproach in our families. Mothers often have insufficient nourishment to give their children and are content to suckle them for a few months, for half or three-quarters of a year. Among primitive peoples children are fed at their mother's breast for two or three years. The figure of the wet-nurse who suckles the child is as a rule merged into the mother; when this has not happened, the reproach is turned into another one - that the nurse, who fed the child so willingly, was sent away by the mother too early. But whatever the true state of affairs may have been, it is impossible that the child's reproach can be justified as often as it is met with. It seems, rather, that the child's avidity for its earliest nourishment is altogether insatiable, that it never gets over the pain of losing its mother's breast. I should not be surprised if the analysis of a primitive child, who could still suck at its mother's breast when it was already able to run about and talk, were to bring the same reproach to light. The fear of being poisoned is also probably connected with the withdrawal of the breast. Poison is nourishment that makes one ill. Perhaps children trace back their early illnesses too to this frustration. A fair amount of intellectual education is a prerequisite for believing in chance; primitive people and uneducated ones, and no doubt children as well, are able to assign a ground for everything that happens. Perhaps originally it was a reason on animistic lines. Even to-day in some strata of our population no one can die without having been killed by someone else - preferably by the doctor. And the regular reaction of a neurotic to the death of someone closely connected with him is to put the blame on himself for having caused the death.

The next accusation against the child's mother flares up when the next baby appears in the nursery. If possible the connection with oral frustration is preserved: the mother could not or would not give the child any more milk because she needed the nourishment for the new arrival. In cases in which the two children are so close in age that lactation is prejudiced by the second pregnancy, this reproach acquires a real basis, and it is a remarkable fact that a child, even with an age difference of only 11 months, is not too young to take notice of what is happening. But what the child grudges the unwanted intruder and rival is not only the suckling but all the other signs of maternal care. It feels that it has been dethroned, despoiled, prejudiced in its rights; it casts a jealous hatred upon the new baby and develops a grievance against the faithless mother which often finds expression in a disagreeable change in its behaviour. It becomes 'naughty', perhaps, irritable and disobedient and goes back on the advances it has made towards controlling its excretions. All of this has been very long familiar and is accepted as self-evident; but we rarely form a correct idea of the strength of these jealous impulses, of the tenacity with which they persist and of the magnitude of their influence on later development. Especially as this jealousy is constantly receiving fresh nourishment in the later years of childhood and the whole shock is repeated with the birth of each new brother or sister. Nor does it make much difference if the child happens to remain the mother's preferred favourite. A child's demands for love are immoderate, they make exclusive claims and tolerate no sharing.

An abundant source of a child's hostility to its mother is provided by its multifarious sexual wishes, which alter according to the phase of the libido and which cannot for the most part be satisfied. The strongest of these frustrations occur at the phallic period, if the mother forbids pleasurable activity with the genitals - often with severe threats and every sign of displeasure - activity to which, after all, she herself had introduced the child. One would think these were reasons enough to account for a girl's turning away from her mother. One would judge, if so, that the estrangement follows inevitably from the nature of children's sexuality, from the immoderate character of their demand for love and the impossibility of fulfilling their sexual wishes. It might be thought indeed that this first love-relation of the child's is doomed to dissolution for the very reason that it is the first, for these early object-cathexes are regularly ambivalent to a high degree. A powerful tendency to aggressiveness is always present beside a powerful love, and the more passionately a child loves its object the more sensitive does it become to disappointments and frustrations from that object; and in the end the love must succumb to the accumulated hostility. Or the idea that there is an original ambivalence such as this in erotic cathexes may be rejected, and it may be pointed out that it is the special nature of the mother-child relation that leads, with equal inevitability, to the destruction of the child's love; for even the mildest upbringing cannot avoid using compulsion and introducing restrictions, and any such intervention in the child's liberty must provoke as a reaction an inclination to rebelliousness and aggressiveness. A discussion of these possibilities might, I think, be most interesting; but an objection suddenly emerges which forces our interest in another direction. All these factors - the slights, the disappointments in love, the jealousy, the seduction followed by prohibition - are, after all, also in operation in the relation of a *boy* to his mother and are yet unable to alienate him from the maternal object. Unless we can find something that is specific for girls and is not present or not in the same way present in boys, we shall not have explained the termination of the attachment of girls to their mother.

I believe we have found this specific factor, and indeed where we expected to find it, even though in a surprising form. Where we expected to find it, I say, for it lies in the castration complex. After all, the anatomical distinction must express itself in psychical consequences. It was, however, a surprise to learn from analyses that girls hold their mother responsible for their lack of a penis and do not forgive her for their being thus put at a disadvantage.

As you hear, then, we ascribe a castration complex to women as well. And for good reasons, though its content cannot be the same as with boys. In the latter the castration complex arises after they have learnt from the sight of the female genitals that the organ which they value so highly need not necessarily accompany the body. At this the boy recalls to mind the threats he brought on himself by his doings with that organ, he begins to give credence to them and falls under the influence of fear of castration, which will be the most powerful motive force in his subsequent development. The castration complex of girls is also started by the sight of the genitals of the other sex. They at once notice the difference and, it must be admitted, its significance too. They feel seriously wronged, often declare that they want to 'have something like it too', and fall a victim to 'envy for the penis', which will leave ineradicable traces on their development and the formation of their character and which will not be surmounted in even the most favourable cases without a severe expenditure of psychical energy. The girl's recognition of the fact of her being without a penis does not by any means imply that she submits to the fact easily. On the contrary, she continues to hold on for a long time to the wish to get something like it herself and she believes in that possibility for improbably long years; and analysis can show that, at a period when knowledge of reality has long since rejected the fulfilment of the wish as unattainable, it persists in the unconscious and retains a considerable cathexis of energy. The wish to get the longed-for penis eventually in spite of everything may contribute to the motives that drive a mature woman to analysis, and what she may reasonably expect from analysis - a capacity, for instance, to carry on an intellectual profession - may often be recognized as a sublimated modification of this repressed wish.

One cannot very well doubt the importance of envy for the penis. You may take it as an instance of male injustice if I assert that envy and jealousy play an even greater part in the mental life of women than of men. It is not that I think these characteristics are absent in men or that I think they have no other roots in women than envy for the penis; but I am inclined to attribute their greater amount in women to this latter influence. Some analysts, however, have shown an inclination to depreciate the importance of this first instalment of penis-envy in the phallic phase. They are of opinion that what we find of this attitude in women is in the main a secondary structure which has come about on the occasion of later conflicts by regression to this early infantile impulse. This, however, is a general problem of depth psychology. In many pathological - or even unusual - instinctual attitudes (for instance, in all sexual perversions) the question arises of how much of their strength is to be attributed to early infantile fixations and how much to the influence of later experiences and developments. In such cases it is almost always a matter of complementary series such as we put forward in our discussion of the aetiology of the neuroses. Both factors play a part in varying amounts in the causation; a less on the one side is balanced by a more on the other. The infantile factor sets the pattern in all cases but does not always determine the issue, though it often does. Precisely in the case of penis-envy I should argue decidedly in favour of the preponderance of the infantile factor.

The discovery that she is castrated is a turning-point in a girl's growth. Three possible lines of development start from it: one leads to sexual inhibition or to neurosis, the second to change of character in the sense of a masculinity complex, the third, finally, to normal femininity. We have learnt a fair amount, though not everything, about all three.

The essential content of the first is as follows: the little girl has hitherto lived in a masculine way, has been able to get pleasure by the excitation of her clitoris and has brought this activity into relation with her sexual wishes directed towards her mother, which are often active ones; now, owing to the influence of her penis-envy, she loses her enjoyment in her phallic sexuality. Her self-love is mortified by the comparison with the boy's far superior equipment and in consequence she renounces her masturbatory satisfaction from her clitoris, repudiates her love for her mother and at the same time not infrequently represses a good part of her sexual trends in general. No doubt her turning away from her mother does not occur all at once, for to begin with the girl regards her castration as an individual misfortune, and only gradually extends it to other females and finally to her mother as well. Her love was directed to her *phallic* mother; with the discovery that her mother is castrated it becomes possible to drop her as an object, so that the motives for hostility, which have long been accumulating, gain the upper hand. This means, therefore, that as a result of the discovery of women's lack of a penis they are debased in value for girls just as they are for boys and later perhaps for men.

You all know the immense aetiological importance attributed by our neurotic patients to their masturbation. They make it responsible for all their troubles and we have the greatest difficulty in persuading them that they are mistaken. In fact, however, we ought to admit to them that they are right, for masturbation is the executive agent of infantile sexuality, from the faulty development of which they are indeed suffering. But what neurotics mostly blame is the masturbation of the period of puberty; they have mostly forgotten that of early infancy, which is what is really in question. I wish I might have an opportunity some time of explaining to you at length how important all the factual details of early masturbation become for the individual's subsequent neurosis or character: whether or not it was discovered, how the parents struggled against it or permitted it, or whether he succeeded in suppressing it himself. All of this leaves permanent traces on his development. But I am on the whole glad that I need not do this. It would be a hard and tedious task and at the end of it you would put me in an embarrassing situation by quite certainly asking me to give you some practical advice as to how a parent or educator should deal with the masturbation of small children. From the development of girls, which is what my present lecture is concerned with, I can give you the example of a child herself trying to get free from masturbating. She does not always succeed in this. If envy for the penis has provoked a powerful impulse against clitoral masturbation but this nevertheless refuses to give way, a violent struggle for liberation ensues in which the girl, as it were, herself takes over the role of her deposed mother and gives expression to her entire dissatisfaction with her inferior clitoris in her efforts against obtaining satisfaction from it. Many years later, when her masturbatory activity has long since been suppressed, an interest still persists which we must interpret as a defence against a temptation that is still dreaded. It manifests itself in the emergence of sympathy for those to whom similar difficulties are attributed, it plays a part as a motive in contracting a marriage and, indeed, it may determine the choice of a husband or lover. Disposing of early infantile masturbation is truly no easy or indifferent business.

Along with the abandonment of clitoridal masturbation a certain amount of activity is renounced. Passivity now has the upper hand, and the girl's turning to her father is accomplished principally with the help of passive instinctual impulses. You can see that a wave of development like this, which clears the phallic activity out of the way, smoothes the ground for femininity. If too much is not lost in the course of it through repression, this femininity may turn out to be normal. The wish with which the girl turns to her father is no doubt originally the wish for the penis which her mother has refused her and which she now expects from her father. The feminine situation is only established, however, if the wish for a penis is replaced by one for a baby, if, that is, a baby takes the place of a penis in accordance with an ancient symbolic equivalence. It has not escaped us that the girl has wished for a baby earlier, in the undisturbed phallic phase: that, of course, was the meaning of her playing with dolls. But that play was not in fact an expression of her femininity; it served as an identification with her mother with the intention of substituting activity for passivity. She was playing the part of her mother and the doll was herself: now she could do with the baby everything that her mother used to do with her. Not until the emergence of the wish for a penis does the doll-baby become a baby from the girl's father, and thereafter the aim of the most powerful feminine wish. Her happiness is great if later on this wish for a baby finds fulfilment in reality, and quite especially so if the baby is a little boy who brings the longed-for penis with him. Often enough in her combined picture of 'a baby from her father' the emphasis is laid on the baby and her father left unstressed. In this way the ancient masculine wish for the possession of a penis is still faintly visible through the femininity now achieved. But perhaps we ought rather to recognize this wish for a penis as being *par excellence* a feminine one.

With the transference of the wish for a penis-baby on to her father, the girl has entered the situation of the Oedipus complex. Her hostility to her mother, which did not need to be freshly created, is now greatly intensified, for she becomes the girl's rival, who receives from her father everything that she desires from him. For a long time the girl's Oedipus complex concealed her pre-Oedipus attachment to her mother from our view, though it is nevertheless so important and leaves such lasting fixations behind it. For girls the Oedipus situation is the outcome of a long and difficult development; it is a kind of preliminary solution, a position of rest which is not soon abandoned, especially as the beginning of the latency period is not far distant. And we are now struck by a difference between the two sexes, which is probably momentous, in regard to the relation of the Oedipus complex to the castration complex. In a boy the Oedipus complex, in which he desires his mother and would like to get rid of his father as being a rival, develops naturally from the phase of his phallic sexuality. The threat of castration compels him, however, to give up that attitude. Under the impression of the danger of losing his penis, the Oedipus complex is abandoned, repressed and, in the most normal cases, entirely destroyed, and a severe super-ego is set up as its heir. What happens with a girl is almost the opposite. The castration complex prepares for the Oedipus complex instead of destroying it; the girl is driven out of her attachment to her mother through the influence of her envy for the penis and she enters the Oedipus situation as though into a haven of refuge. In the absence of fear of castration the chief motive is lacking which leads boys to surmount the Oedipus complex. Girls remain in it for an indeterminate length of time; they demolish it late and, even so, incompletely. In these circumstances the formation of the super-ego must suffer; it cannot attain the strength and independence which give it its cultural significance, and feminists are not pleased when we point out to them the effects of this factor upon the average feminine character.

To go back a little. We mentioned as the second possible reaction to the discovery of female castration the development of a powerful masculinity complex. By this we mean that the girl refuses, as it were, to recognize the unwelcome fact and, defiantly rebellious, even exaggerates her previous masculinity, clings to her clitoral activity and takes refuge in an identification with her phallic mother or her father. What can it be that decides in favour of this outcome? We can only suppose that it is a constitutional factor, a greater amount of activity, such as is ordinarily characteristic of a male. However that may be, the essence of this process is that at this point in development the wave of passivity is avoided which opens the way to the turn towards femininity. The extreme achievement of such a masculinity complex would appear to be the influencing of the choice of an object in the sense of manifest homosexuality. Analytic experience teaches us, to be sure, that female homosexuality is seldom or never a direct continuation of infantile masculinity. Even for a girl of this kind it seems necessary that she should take her father as an object for some time and enter the Oedipus situation. But afterwards, as a result of her inevitable disappointments from her father, she is driven to regress into her early masculinity complex. The significance of these disappointments must not be exaggerated; a girl who is destined to become feminine is not spared them, though they do not have the same effect. The predominance of the constitutional factor seems indisputable; but the two phases in the development of female homosexuality are well mirrored in the practices of homosexuals, who play the parts of mother and baby with each other as often and as clearly as those of husband and wife.

What I have been telling you here may be described as the prehistory of women. It is a product of the very last few years and may have been of interest to you as an example of detailed analytic work. Since its subject is woman, I will venture on this occasion to mention by name a few of the women who have made valuable contributions to this investigation. Dr. Ruth Mack Brunswick was the first to describe a case of neurosis which went back to a fixation in the pre-Oedipus stage and had never reached the Oedipus situation at all. The case took the form of jealous paranoia and proved accessible to therapy. Dr. Jeanne Lampl-de Groot has established the incredible phallic activity of girls towards their mother by some assured observations, and Dr. Helene Deutsch has shown that the erotic actions of homosexual women reproduce the relations between mother and baby.

It is not my intention to pursue the further behaviour of femininity through puberty to the period of maturity. Our knowledge, moreover, would be insufficient for the purpose. But I will bring a few features together in what follows. Taking its prehistory as a starting-point, I will only emphasize here that the development of femininity remains exposed to disturbance by the residual phenomena of the early masculine period. Regressions to the fixations of the pre-Oedipus phases very frequently occur; in the course of some women's lives there is a repeated alternation between periods in which masculinity or femininity gains the upper hand. Some portion of what we men call 'the enigma of women' may perhaps be derived from this expression of bisexuality in women's lives. But another question seems to have become ripe for judgement in the course of these researches. We have called the motive force of sexual life 'the libido'. Sexual life is dominated by the polarity of masculine-feminine; thus the notion suggests itself of considering the relation of the libido to this antithesis. It would not be surprising if it were to turn out that each sexuality had its own special libido appropriated to it, so that one sort of libido would pursue the aims of a masculine sexual life and another sort those of a feminine one. But nothing of the kind is true. There is only one libido, which serves both the masculine and the feminine sexual functions. To it itself we cannot assign any sex; if, following the conventional equation of activity and masculinity, we are inclined to describe it as masculine, we must not forget that it also covers trends with a passive aim. Nevertheless the juxtaposition 'feminine libido' is without any justification. Furthermore, it is our impression that more constraint has been applied to the libido when it is pressed into the service of the feminine function, and that - to speak teleologically - Nature takes less careful account of its demands than in the case of masculinity. And the reason for this may lie - thinking once again teleologically - in the fact that the accomplishment of the aim of biology has been entrusted to the aggressiveness of men and has been made to some extent independent of women's consent.

The sexual frigidity of women, the frequency of which appears to confirm this disregard, is a phenomenon that is still insufficiently understood. Sometimes it is psychogenic and in that case accessible to influence; but in other cases it suggests the hypothesis of its being constitutionally determined and even of there being a contributory anatomical factor.

I have promised to tell you of a few more psychical peculiarities of mature femininity, as we come across them in analytic observation. We do not lay claim to more than an average validity for these assertions; nor is it always easy to distinguish what should be ascribed to the influence of the sexual function and what to social breeding. Thus, we attribute a larger amount of narcissism to femininity, which also affects women's choice of object, so that to be loved is a stronger need for them than to love. The effect of penis-envy has a share, further, in the physical vanity of women, since they are bound to value their charms more highly as a late compensation for their original sexual inferiority. Shame, which is considered to be a feminine characteristic *par excellence* but is far more a matter of convention than might be supposed, has as its purpose, we believe, concealment of genital deficiency. We are not forgetting that at a later time shame takes on other functions. It seems that women have made few contributions to the discoveries and inventions in the history of civilization; there is, however, one technique which they may have invented - that of plaiting and weaving. If that is so, we should be tempted to guess the unconscious motive for the achievement. Nature herself would seem to have given the model which this achievement imitates by causing the growth at maturity of the pubic hair that conceals the genitals. The step that remained to be taken lay in making the threads adhere to one another, while on the body they stick into the skin and are only matted together. If you reject this idea as fantastic and regard my belief in the influence of lack of a penis on the configuration of femininity as an *idée fixe*, I am of course defenceless.

The determinants of women's choice of an object are often made unrecognizable by social conditions. Where the choice is able to show itself freely, it is often made in accordance with the narcissistic ideal of the man whom the girl had wished to become. If the girl has remained in her attachment to her father - that is, in the Oedipus complex - her choice is made according to the paternal type. Since, when she turned from her mother to her father, the hostility of her ambivalent relation remained with her mother, a choice of this kind should guarantee a happy marriage. But very often the outcome is of a kind that presents a general threat to such a settlement of the conflict due to ambivalence. The hostility that has been left behind follows in the train of the positive attachment and spreads over on to the new object. The woman's husband, who to begin with inherited from her father, becomes after a time her mother's heir as well. So it may easily happen that the second half of a woman's life may be filled by the struggle against her husband, just as the shorter first half was filled by her rebellion against her mother. When this reaction has been lived through, a second marriage may easily turn out very much more satisfying. Another alteration in a woman's nature, for which lovers are unprepared, may occur in a marriage after the first child is born. Under the influence of a woman's becoming a mother herself, an identification with her own mother may be revived, against which she had striven up till the time of her marriage, and this may attract all the available libido to itself, so that the compulsion to repeat reproduces an unhappy marriage between her parents. The difference in a mother's reaction to the birth of a son or a daughter shows that the old factor of lack of a penis has even now not lost its strength. A mother is only brought unlimited satisfaction by her relation to a son; this is altogether the most perfect, the most free from ambivalence of all human relationships. A mother can transfer to her son the ambition which she has been obliged to suppress in herself, and she can expect from him the satisfaction of all that has been left over in her of her masculinity complex. Even a marriage is not made secure until the wife has succeeded in making her husband her child as well and in acting as a mother to him.

A woman's identification with her mother allows us to distinguish two strata: the pre-Oedipus one which rests on her affectionate attachment to her mother and takes her as a model, and the later one from the Oedipus complex which seeks to get rid of her mother and take her place with her father. We are no doubt justified in saying that much of both of them is left over for the future and that neither of them is adequately surmounted in the course of development. But the phase of the affectionate pre-Oedipus attachment is the decisive one for a woman's future: during it preparations are made for the acquisition of the characteristics with which she will later fulfil her role in the sexual function and perform her invaluable social tasks. It is in this identification too that she acquires her attractiveness to a man, whose Oedipus attachment to his mother it kindles into passion. How often it happens, however, that it is only his son who obtains what he himself aspired to! One gets an impression that a man's love and a woman's are a phase apart psychologically.

The fact that women must be regarded as having little sense of justice is no doubt related to the predominance of envy in their mental life; for the demand for justice is a modification of envy and lays down the condition subject to which one can put envy aside. We also regard women as weaker in their social interests and as having less capacity for sublimating their instincts than men. The former is no doubt derived from the dissocial quality which unquestionably characterizes all sexual relations. Lovers find sufficiency in each other, and families too resist inclusion in more comprehensive associations. The aptitude for sublimation is subject to the greatest individual variations. On the other hand I cannot help mentioning an impression that we are constantly receiving during analytic practice. A man of about thirty strikes us as a youthful, somewhat unformed individual, whom we expect to make powerful use of the possibilities for development opened up to him by analysis. A woman of the same age, however, often frightens us by her psychical rigidity and unchangeability. Her libido has taken up final positions and seems incapable of exchanging them for others. There are no paths open to further development; it is as though the whole process had already run its course and remains thenceforward insusceptible to influence - as though, indeed, the difficult development to femininity had exhausted the possibilities of the person concerned. As therapists we lament this state of things, even if we succeed in putting an end to our patient's ailment by doing away with her neurotic conflict.

That is all I had to say to you about femininity. It is certainly incomplete and fragmentary and does not always sound friendly. But do not forget that I have only been describing women in so far as their nature is determined by their sexual function. It is true that that influence extends very far; but we do not overlook the fact that an individual woman may be a human being in other respects as well. If you want to know more about femininity, enquire from your own experiences of life, or turn to the poets, or wait until science can give you deeper and more coherent information.

LECTURE XXXIV

EXPLANATIONS, APPLICATIONS AND ORIENTATIONS

LADIES AND GENTLEMEN, - Perhaps you will allow me for once, as a relief from the dry tone of these lectures, to talk to you about some things which have very little theoretical significance but which concern you closely in so far as you are friendly disposed to psycho-analysis. Let us imagine, for instance, that in your leisure hours you take up a German, English or American novel, in which you expect to find an account of contemporary people and society. After a few pages you come upon a first comment on psycho-analysis and soon afterwards upon others, even though the context does not seem to call for them. You must not imagine that it is a question of applying depth-psychology to a better understanding of the characters in the book or of their actions - though, incidentally, there are other and more serious works in which an attempt of that kind is in fact made. No, these are for the most part facetious remarks intended by the author to display his wide reading and intellectual superiority. Nor will you always form an impression that he really knows what he is talking about. Again, you may go as a recreation to a social gathering - and this need not necessarily happen in Vienna. After a short time the conversation turns upon psycho-analysis and you will hear the greatest variety of people passing their judgement on it, mostly in voices of unwavering certainty. It is quite usual for the judgement to be contemptuous or often slanderous or at least, once again, facetious. If you are so imprudent as to betray the fact that you know something about the subject, they fall upon you with one accord, ask for information and explanations and soon convince you that all these severe judgements had been arrived at without any basis of knowledge, that scarcely any of these critics had ever opened an analytic book or, if they had, had gone beyond the first resistance aroused by their contact with this new material.

You may perhaps expect an introduction to psycho-analysis to give you instructions, too, on what arguments you should use to correct these obvious errors about analysis, what books you should recommend to give more accurate information, or even what examples you should bring up in the discussion from your reading or experience in order to alter the company's attitude. I must beg you to do none of this. It would be useless. The best plan would be for you to conceal your superior knowledge altogether. If that is no longer possible, limit yourself to saying that, so far as you can make out, psycho-analysis is a special branch of knowledge, very hard to understand and to form an opinion on, which is concerned with very serious things, so that a few jokes will not bring one to close quarters with it - and that it would be better to find some other plaything for social entertainment. Nor, of course, will you join in attempts at interpretation, if unwary people repeat their dreams; and you will resist the temptation to curry favour for analysis by retailing reports of its cures.

But you may raise the question of why these people - both the ones who write books and the conversationalists - behave so badly; and you may incline to the view that the responsibility for this lies not only on them but also on psycho-analysis. I think so too. What you come upon as prejudice in literature and society is an after-effect of an earlier judgement - the judgement, namely, that was formed upon the young psycho-analysis by the representatives of official science. I once complained of this in a historical account I wrote, and I shall not do so again - perhaps that once was too often - but it is a fact that there was no violation of logic, and no violation of propriety and good taste, to which the scientific opponents of psycho-analysis did not give way at that time. The situation recalled what was actually put in practice in the Middle Ages when an evil-doer, or even a mere political opponent, was put in the pillory and given over to maltreatment by the mob. You may not realize clearly, perhaps, how far upwards in our society mob-characteristics extend, and what misconduct people will be guilty of when they feel themselves part of a crowd and relieved of personal responsibility. At the beginning of that time I was more or less alone and I soon saw that there was no future in polemics but that it was equally senseless to lament and to invoke the help of kindlier spirits, for there were not courts to which such appeals could be made. So I took another road. I made a first application of psycho-analysis by explaining to myself that this behaviour of the crowd was a manifestation of the same resistance which I had to struggle against in individual patients. I refrained from polemics myself and influenced my adherents, when little by little they appeared, in the same direction. This procedure was the right one. The interdict which lay upon psycho-analysis in those days has been lifted since then. But, just as an abandoned faith survives as a superstition, just as a theory which has been given up by science continues to exist as a popular belief, so the original outlawing of psycho-analysis by scientific circles persists to-day in the facetious contempt of the laymen who write books or make conversation. So this will no longer surprise you.

But you must not expect to hear the glad tidings that the struggle about analysis is over and has ended in its recognition as a science and its admission as a subject for instruction at universities. There is no question of that. The struggle continues, though in more polite forms. What is also new is that a sort of buffer-layer has formed in scientific society between analysis and its opponents. This consists of people who allow the validity of some portions of analysis and admit as much, subject to the most entertaining qualifications, but who on the other hand reject other portions of it, a fact which they cannot proclaim too loudly. It is not easy to divine what determines their choice in this. It seems to depend on personal sympathies. One person will take objection to sexuality, another to the unconscious; what seems particularly unpopular is the fact of symbolism. Though the structure of psycho-analysis is unfinished, it nevertheless presents, even to-day, a unity from which elements cannot be broken off at the caprice of whoever comes along: but these eclectics seem to disregard this. I have never had the impression that these half- or quarter-adherents based their rejection on an examination of the facts. Some distinguished men, too, are included in this category. They, to be sure, are excused by the fact that their time and their interest belong to other things - to those things, namely, in mastering which they have achieved so much. But in that case would they not do better to suspend their judgement instead of taking sides so decisively? With one of these great men I once succeeded in effecting a rapid conversion. He was a world-famous critic, who had followed the spiritual currents of the time with benevolent understanding and prophetic penetration. I only came to know him when he was past his eightieth year; but he was still enchanting in his talk. You will easily guess whom I mean. Nor was it I who introduced the subject of psycho-analysis. It was he who did so, by comparing himself with me in the most modest fashion. 'I am only a literary man,' he said, 'but you are a natural scientist and discoverer. However, there is one thing I must say to you: I have never had sexual feelings towards my mother.' 'But there is no need at all for you to have known them,' was my reply; 'to grown-up people those are unconscious feelings.' 'Oh! so *that's* what you think!' he said with relief, and pressed my hand. We went on talking together on the best of terms for another few hours. I heard later that in the few remaining years of his life he often spoke of analysis in a friendly way and was pleased at being able to use a word that was new to him - 'repression'.

There is a common saying that we should learn from our enemies. I confess I have never succeeded in doing so; but I thought all the same that it might be instructive for you if I undertook a review of all the reproaches and objections which the opponents of psycho-analysis have raised against it, and if I went on to point out the injustices and offences against logic which could so easily be revealed in them. But 'on second thoughts' I told myself that it would not be at all interesting but would become tedious and distressing and would be precisely what I have been so carefully avoiding all these years. So you must forgive me if I pursue this path no further and if I spare you the judgements of our so-called scientific opponents. After all it is nearly always a question of people whose one qualification is the impartiality which they have preserved by keeping at a distance from the experiences of psycho-analysis. But I know there are other cases in which you will not let me off so lightly. 'Nevertheless', you will tell me, 'there are such a number of people to whom your last remark does not apply. They have not evaded analytic experience, they have analysed patients and have perhaps been analysed themselves; for a time they have even been your collaborators. Yet they have arrived at other views and theories on the basis of which they have seceded from you and founded independent schools of psycho-analysis. You ought to throw some light for us on the possibility and significance of these secessionist movements which have been so frequent in the history of analysis.'

Well, I will try to do so; but only in brief, since they contribute less to an understanding of analysis than you might expect. I feel sure you will be thinking in the first place of Adler's 'Individual Psychology', which, in America for instance, is regarded as a line of thought collateral with our psycho-analysis and on a par with it and which is regularly mentioned alongside of it. Actually, Individual Psychology has very little to do with psycho-analysis but, as a result of certain historical circumstances, leads a kind of parasitic existence at its expense. The determinants which we have attributed to this group of opponents apply to the founders of Individual Psychology only to a limited extent. Its very name is inappropriate and seems to have been the product of embarrassment. We cannot allow the legitimate use of the term as an antithesis to 'group psychology' to be interfered with; moreover, our own activity is concerned for the most part and primarily with the psychology of human individuals. I shall not enter to-day upon an objective criticism of Adler's Individual Psychology; there is no place for it in the plan of these introductory lectures. Besides, I have already attempted it once, and feel no temptation to change anything in what I said then. I will, however, illustrate the impression his views produce by a small episode dating from the years before analysis.

In the neighbourhood of the little Moravian town in which I was born, and which I left when I was a three-year-old child, there is a modest health-resort, prettily situated in the woods. During my schooldays I went there several times in the holidays. Some twenty years later the illness of a near relative was the occasion for my visiting the place again. In the course of a conversation with the physician attached to the spa, who had attended my relative, I enquired among other things about his relations with the peasants - Slovaks, I believe - who constituted his whole *clientèle* during the winter. He told me that his medical practice proceeded as follows. In his consulting hours the patients came into his room and stood in a row. One after another stepped forward and described his complaint: he had backache or pains in his stomach or had tired legs, and so on. The doctor then examined him and, after satisfying himself as to what was the matter, called out the diagnosis, which was the same in every case. He translated the word to me; it meant approximately 'bewitched'. I asked in astonishment whether the peasants made no objection to his verdict being the same with every patient. 'Oh, no!' he replied, 'they are very pleased with it: it is what they expected. Each of them, as he went back to his place in the row, showed the others by looks and gestures that I was a fellow who understood things.' Little did I guess at the time in what circumstances I should come across an analogous situation once again.

For, whether a man is a homosexual or a necrophilic, a hysteric suffering from anxiety, an obsessional neurotic cut off from society, or a raving lunatic, the 'Individual Psychologist' of the Adlerian school will declare that the impelling motive of his condition is that he wishes to assert himself, to overcompensate for his inferiority, to remain 'on top', to pass from the feminine to the masculine line. In my young student days we used to hear something very much the same in the out-patients' department when a case of hysteria was introduced: hysterical patients, we were told, produce their symptoms to make themselves interesting, to draw attention to themselves. It is a remarkable thing how these ancient pieces of wisdom keep on cropping up. But even at that time this fragment of psychology did not seem to cover the riddle of hysteria. It left unexplained, for instance, why the patients used no other methods for attaining their purpose. There must, of course, be *something* correct in this theory of the 'Individual Psychologists': a small particle is taken for the whole. The self-preservative instinct will try to profit by every situation; the ego will seek to turn even illness to its advantage. In psycho-analysis this is known as the 'secondary gain from illness'. Though, indeed, when we think of the facts of masochism, of the unconscious need for punishment and of neurotic self-injury, which make plausible the hypothesis of there being instinctual impulses that run contrary to self-preservation, we even feel shaken in our belief in the general validity of the commonplace truth on which the theoretical structure of Individual Psychology is erected. But a theory such as this is bound to be very welcome to the great mass of the people, a theory which recognizes no complications, which introduces no new concepts that are hard to grasp, which knows nothing of the unconscious, which gets rid at a single blow of the universally oppressive problem of sexuality and which restricts itself to the discovery of the artifices by which people seek to make life easy. For the mass of the people themselves take things easily: they call for no more than a single reason by way of explanation, they do not thank science for its diffuseness, they want to have simple solutions and to know that problems are solved. When we consider how very far Individual Psychology goes in meeting these demands, we cannot suppress the recollection of a sentence in *Wallenstein*:

Wär' der Gedank' nicht so verwünscht gescheidt,
Man wär' versucht, ihn herzlich dumm zu nennen.

Criticism from specialist circles, which is so relentless against psycho-analysis, has in general handled Individual Psychology with kid gloves. It is true that in America one of the most highly respected psychiatrists published a paper against Adler under the title 'Enough', in which he gave energetic expression to his boredom at the 'compulsion to repeat' of Individual Psychology. If others have treated it far more amiably, no doubt their antagonism to analysis has had much to do with it.

I need not say much about other schools which have branched off from our psycho-analysis. The fact that they have done so cannot be used either for or against the validity of psycho-analytic theories. You have only to think of the strong emotional factors that make it hard for many people to fit themselves in with others or to subordinate themselves, and of the still greater difficulty justly insisted on by the dictum 'Quot capita tot sensus'. When the differences of opinion had gone beyond a certain point, the most sensible thing was to part and thereafter to proceed along our different ways - especially when the theoretical divergence involved a change in practical procedure. Suppose, for instance, that an analyst attaches little value to the influence of the patient's personal past and looks for the causation of neuroses exclusively in present-day motives and in expectations of the future. In that case he will also neglect the analysis of childhood; he will have to adopt an entirely different technique and will have to make up for the omission of the events from the analysis of childhood by increasing his didactic influence and by directly indicating certain particular aims in life. We for our part will then say: 'This may be a school of wisdom; but it is no longer analysis.' Or someone else may arrive at the view that the experience of anxiety at birth sows the seed of all later neurotic disturbances. It may thereupon seem to him legitimate to restrict analysis to the consequences of this single impression and to promise therapeutic success from a treatment lasting from three to four months. As you will observe, I have chosen two examples which start from diametrically opposite premisses. It is an almost universal characteristic of these 'secessionist movements' that each of them takes hold of one fragment out of the wealth of themes in psycho-analysis and makes itself independent on the basis of this seizure - selecting the instinct for mastery, for instance, or ethical conflict, or the mother, or genitality, and so on. If it appears to you that secessions of this sort are already more numerous to-day in the history of psycho-analysis than in other intellectual movements, I am not sure that I should agree with you. If it is the case, the responsibility must be laid on the intimate relations which exist in psycho-analysis between theoretical views and therapeutic treatment. Mere differences of opinion would be tolerable for far longer. People like accusing us psycho-analysts of intolerance. The only manifestation of this ugly characteristic has been precisely our parting from those who think differently from us. No other harm has been done to them. On the contrary, they have fallen on their feet, and are better off than they were before. For by their separation they have usually freed themselves of one of the burdens which weigh us down - the odium of infantile sexuality, perhaps, or the absurdity of symbolism - and are regarded by their environment as passably respectable, which is still not true of those of us who are left behind. Moreover, apart from one notable exception, it was they who excluded themselves.

What further claims do you make in the name of tolerance? That when someone has uttered an opinion which we regard as completely false we should say to him: 'Thank you very much for having given voice to this contradiction. You are guarding us against the danger of complacency and are giving us an opportunity of showing the Americans that we are really as "broad-minded" as they always wish. To be sure, we do not believe a word of what you are saying, but that makes no difference. Probably you are just as right as we are. After all, who can possibly know who is right? In spite of our antagonism, pray allow us to represent your point of view in our publications. We hope that you will be kind enough in exchange to find a place for our views which you deny.' In the future, when the misuse of Einstein's relativity has been entirely achieved, this will obviously become the regular custom in scientific affairs. For the moment, it is true, we have not gone quite so far. We restrict ourselves, in the old fashion, to putting forward only our own convictions, we expose ourselves to the risk of error because it cannot be guarded against, and we reject what is in contradiction to us. We have made plentiful use in psycho-analysis of the right to change our opinions if we think we have found something better.

One of the first applications of psycho-analysis was to teach us to understand the opposition offered to us by our contemporaries because we practised psycho-analysis. Other applications, of an objective nature, may claim a more general interest. Our first purpose, of course, was to understand the disorders of the human mind, because a remarkable experience had shown that here understanding and cure almost coincide, that a traversable road leads from the one to the other. And for a long time it was our only purpose. Then, however, we perceived the close relations, the internal identity indeed, between pathological processes and what are known as normal ones. Psycho-analysis became a depth-psychology; and, since nothing that men make or do is understandable without the co-operation of psychology, the applications of psycho-analysis to numerous fields of knowledge, in particular to those of the mental sciences, came about of their own accord, pushed their way to the front and called for ventilation. These tasks unluckily came up against obstacles which, rooted as they were in the circumstances, have not yet been overcome even to-day. An application of this kind presupposes specialized knowledge which an analyst does not possess, while those who possess it, the specialists, know nothing of analysis and perhaps want to know nothing. The result has been that analysts, as amateurs with an equipment of greater or less adequacy, often hastily scraped together, have made excursions into such fields of knowledge as mythology, the history of civilization, ethnology, the science of religion and so on. They were no better treated by the experts resident in those fields than are trespassers in general: their methods and their findings, in so far as they attracted attention, were in the first instance rejected. But these conditions are constantly improving, and in every region there is a growing number of people who study psycho-analysis in order to make use of it in their special subject, and in order, as colonists, to replace the pioneers. Here we may expect a rich harvest of new discoveries. Applications of analysis are always confirmations of it as well. There, too, where scientific work is further removed from practical activity, the inevitable differences of opinion will no doubt take a less embittered form.

I feel a strong temptation to conduct you through all the applications of psycho-analysis to the mental sciences. They are things worth knowing by anyone with intellectual interests; and not to hear about abnormality and illness for a time would be a well-deserved relaxation. But I must renounce the idea: it would once more carry us outside the framework of these lectures and, I must honestly admit, I should not be equal to the task. It is true that in a few of these regions I myself took the first step; but to-day I no longer embrace the whole field, and I should have to do a great deal of studying in order to master what has been accomplished since my beginnings. Any of you who are disappointed by my refusal may make up for it in the pages of our periodical *Imago*, which is designed to cover the non-medical applications of analysis.

But there is one topic which I cannot pass over so easily - not, however, because I understand particularly much about it or have contributed very much to it. Quite the contrary: I have scarcely concerned myself with it at all. I must mention it because it is so exceedingly important, so rich in hopes for the future, perhaps the most important of all the activities of analysis. What I am thinking of is the application of psycho-analysis to education, to the upbringing of the next generation. I am glad that I am at least able to say that my daughter, Anna Freud, has made this study her life-work and has in that way compensated for my neglect.

The road that led to this application is easily traced. When in the treatment of an adult neurotic we followed up the determinants of his symptoms, we were regularly led back to his early childhood. A knowledge of the later aetiological factors was not sufficient either for understanding the case or for producing a therapeutic effect. We were therefore compelled to make ourselves acquainted with the psychical peculiarities of childhood; we learnt a quantity of things which could not have been learnt except through analysis, and we were able to put right many opinions that were generally held about childhood. We recognized that particular importance attached to the first years of childhood - up to the age of five, perhaps - for several reasons. Firstly, because those years include the early efflorescence of sexuality which leaves behind it decisive instigating factors for the sexual life of maturity. Secondly, because the impressions of this period impinge upon an immature and feeble ego, and act upon it like traumas. The ego cannot fend off the emotional storms which they provoke in any way except by repression and in this manner acquires in childhood all its dispositions to later illnesses and functional disturbances. We realized that the difficulty of childhood lies in the fact that in a short span of time a child has to appropriate the results of a cultural evolution which stretches over thousands of years, including the acquisition of control over his instincts and adaptation to society - or at least the first beginnings of these two. He can only achieve a part of this modification through his own development; much must be imposed on him by education. We are not surprised that children often carry out this task very imperfectly. During these early times many of them pass through states that may be put on a par with neuroses - and this is certainly so in the case of all those who produce manifest illnesses later on. In some children the neurotic illness does not wait till maturity but breaks out already in childhood and gives parents and doctors plenty of trouble.

We had no misgivings over applying analytic treatment to children who either exhibited unambiguous neurotic symptoms or who were on the road to an unfavourable development of character. The apprehension expressed by opponents of analysis that the child would be injured by it proved unfounded. What we gained from these undertakings was that we were able to confirm on the living subject what we had inferred (from historical documents, as it were) in the case of adults. But the gain for the children was also very satisfactory. It turned out that a child is a very favourable subject for analytic therapy; the results are thorough and lasting. The technique of treatment worked out for adults must, of course, be largely altered for children. A child is psychologically a different object from an adult. As yet he possesses no super-ego, the method of free association does not carry far with him, transference (since the real parents are still on the spot) plays a different part. The internal resistances against which we struggle in adults are replaced for the most part in children by external difficulties. If the parents make themselves vehicles of the resistance, the aim of the analysis - and even the analysis itself - is often imperilled. Hence it is often necessary to combine with a child's analysis a certain amount of analytic influencing of his parents. On the other hand, the inevitable deviations of analyses of children from those of adults are diminished by the circumstance that some of our patients have retained so many infantile character traits that the analyst (once again adapting himself to his subject) cannot avoid making use with them of certain of the techniques of child-analysis. It has automatically happened that child-analysis has become the domain of women analysts, and no doubt this will remain true.

The recognition that most of our children pass through a neurotic phase in the course of their development carries with it the germ of a hygienic challenge. The question may be raised whether it would not be expedient to come to a child's help with an analysis even if he shows no signs of a disturbance, as a measure for safeguarding his health, just as to-day we inoculate healthy children against diphtheria without waiting to see if they fall ill of it. The discussion of this question has only an academic interest at present, but I may venture to consider it here. The mere suggestion would seem to the great bulk of our contemporaries to be a monstrous outrage, and in view of the attitude towards analysis of most people in a parental position any hope of putting through such an idea must be abandoned for the time being. Prophylaxis such as this against neurotic illness, which would probably be very effective, also presupposes a quite other constitution of society. The watchword for the application of psycho-analysis to education is to be found to-day elsewhere. Let us make ourselves clear as to what the first task of education is. The child must learn to control his instincts. It is impossible to give him liberty to carry out all his impulses without restriction. To do so would be a very instructive experiment for child-psychologists; but life would be impossible for the parents and the children themselves would suffer grave damage, which would show itself partly at once and partly in later years. Accordingly, education must inhibit, forbid and suppress, and this it has abundantly seen to in all periods of history. But we have learnt from analysis that precisely this suppression of instincts involves the risk of neurotic illness. As you will remember, we have examined in detail how this occurs. Thus education has to find its way between the Scylla of non-interference and the Charybdis of frustration. Unless this problem is entirely insoluble, an optimum must be discovered which will enable education to achieve the most and damage the least. It will therefore be a matter of deciding how much to forbid, at what times and by what means. And in addition we have to take into account the fact that the objects of our educational influence have very different innate constitutional dispositions, so that it is quite impossible that the same educational procedure can be equally good for all children. A moment's reflection tells us that hitherto education has fulfilled its task very badly and has done children great damage. If it discovers the optimum and carries out its task ideally, it can hope to wipe out one of the factors in the aetiology of falling ill - the influence of the accidental traumas of childhood. It cannot in any case get rid of the other factor - the power of an insubordinate instinctual constitution. If now we consider the difficult problems that confront the educator - how he has to recognize the child's constitutional individuality, to infer from small indications what is going on in his immature mind, to give him the right amount of love and yet to maintain an effective degree of authority - we shall tell ourselves that the only appropriate preparation for the profession of educator is a thorough psycho-analytic training. It would be best that he should have been analysed himself, for, when all is said and done, it is impossible to assimilate analysis without experiencing it personally. The analysis of teachers and educators seems to be a more efficacious prophylactic measure than the analysis of children themselves, and there are less difficulties in the way of putting it into practice.

We may mention, though only as an incidental consideration, an indirect way in which the upbringing of children may be helped by analysis and which may with time acquire a greater influence. Parents who have themselves experienced an analysis and owe much to it, including an insight into the faults of their own upbringing, will treat their children with better understanding and will spare them much of what they themselves were not spared.

Parallel with the efforts of analysts to influence education, other investigations are being made into the origin and prevention of delinquency and crime. Here again I am only opening the door for you and showing you the rooms that lie beyond it, without leading you inside. I am certain that if you remain loyal to your interest in psycho-analysis you will be able to learn much that is new and valuable on these subjects. I must not, however, leave the topic of education without referring to one particular aspect of it. It has been said - and no doubt justly - that every education has a partisan aim, that it endeavours to bring the child into line with the established order of society, without considering how valuable or how stable that order may be in itself. If one is convinced of the defects in our present social arrangements, education with a psycho-analytic alignment cannot justifiably be put at their service as well: it must be given another and higher aim, liberated from the prevailing demands of society. In my opinion, however, this argument is out of place here. Such a demand goes beyond the legitimate function of analysis. In the same way, it is not the business of a doctor who is called in to treat a case of pneumonia to concern himself with whether the patient is an honest man or a suicide or a criminal, whether he deserves to remain alive or whether one ought to wish him to. This other aim which it is desired to give to education will also be a partisan one, and it is not the affair of an analyst to decide between the parties. I am leaving entirely on one side the fact that psycho-analysis would be refused any influence on education if it admitted to intentions inconsistent with the established social order. Psycho-analytic education will be taking an uninvited responsibility on itself if it proposes to mould its pupils into rebels. It will have played its part if it sends them away as healthy and efficient as possible. It itself contains enough revolutionary factors to ensure that no one educated by it will in later life take the side of reaction and suppression. It is even my opinion that revolutionary children are not desirable from any point of view.

I propose further, Ladies and Gentlemen, to say a few words to you about psycho-analysis as a form of therapy. I discussed the theoretical side of this question fifteen years ago and I cannot formulate it in any other manner to-day; I have now to tell you of our experience during this interval. As you know, psycho-analysis originated as a method of treatment; it has far outgrown this, but it has not abandoned its home-ground and it is still linked to its contact with patients for increasing its depth and for its further development. The accumulated impressions from which we derive our theories could be arrived at in no other way. The failures we meet with as therapists are constantly setting us new tasks and the demands of real life are an effective guard against an overgrowth of the speculation which we cannot after all do without in our work. I have already discussed long ago the means used by psycho-analysis in helping patients, when it does help them, and the method by which it does so; to-day I shall enquire how much it achieves.

You are perhaps aware that I have never been a therapeutic enthusiast; there is no danger of my misusing this lecture by indulging in eulogies. I would rather say too little than too much. During the period at which I was the only analyst, people who were ostensibly friendly to my ideas used to say to me: 'That's all very nice and clever; but show me a case that you have cured by analysis.' This was one of the many formulas which in the course of time have succeeded one another in performing the function of pushing the uncomfortable novelty aside. To-day it is as out of date as many others: the analyst, too, has a heap of letters in his files from grateful patients who have been cured. The analogy does not stop at that. Psycho-analysis is really a method of treatment like others. It has its triumphs and its defeats, its difficulties, its limitations, its indications. At one time a complaint was made against analysis that it was not to be taken seriously as a treatment since it did not dare to issue any statistics of its successes. Since then, the Psycho-Analytic Institute in Berlin, which was founded by Dr. Max Eitingon, has published a statement of its results during its first ten years. Its therapeutic successes give grounds neither for boasting nor for being ashamed. But statistics of that kind are in general uninformative; the material worked upon is so heterogeneous that only very large numbers would show anything. It is wiser to examine one's individual experiences. And here I should like to add that I do not think our cures can compete with those of Lourdes. There are so many more people who believe in the miracles of the Blessed Virgin than in the existence of the unconscious. If we turn to mundane competitors, we must compare psycho-analytic treatment with other kinds of psychotherapy. To-day organic physical methods of treating neurotic states need scarcely be mentioned. Analysis as a psycho-therapeutic procedure does not stand in opposition to other methods used in this specialized branch of medicine; it does not diminish their value nor exclude them. There is no theoretical inconsistency in a doctor who likes to call himself a psychotherapist using analysis on his patients alongside of any other method of treatment according to the peculiarities of the case and the favourable or unfavourable external circumstances. It is in fact technique that necessitates the specialization in medical practice. Thus in the same way surgery and orthopaedics were obliged to separate. Psycho-analytic activity is arduous and exacting; it cannot well be handled like a pair of glasses that one puts on for reading and takes off when one goes for a walk. As a rule psycho-analysis possesses a doctor either entirely or not at all. Those psychotherapists who make use of analysis among other methods, occasionally, do not to my knowledge stand on firm analytic ground; they have not accepted the whole of analysis but have watered it down - have drawn its fangs, perhaps; they cannot be counted as analysts. This is, I think, to be regretted. But co-operation in medical practice between an analyst and a psychotherapist who restricts himself to other techniques would serve quite a useful purpose.

Compared with the other psychotherapeutic procedures psycho-analysis is beyond any doubt the most powerful. It is just and fair, too, that this should be so for it is also the most laborious and time-consuming; it would not be used on slight cases. In suitable cases it is possible by its means to get rid of disturbances and bring about changes for which in pre-analytic times one would not have ventured to hope. But it has its very appreciable limits. The therapeutic ambition of some of my adherents has made the greatest efforts to overcome these obstacles so that every sort of neurotic disorder might be curable by psycho-analysis. They have endeavoured to compress the work of analysis into a shorter duration, to intensify transference so that it may be able to overcome any resistance, to unite other forms of influence with it so as to compel a cure. These efforts are certainly praiseworthy, but, in my opinion, they are vain. They bring with them, too, a danger of being oneself forced away from analysis and drawn into a boundless course of experimentation. The expectation that every neurotic phenomenon can be cured may, I suspect, be derived from the layman's belief that the neuroses are something quite unnecessary which have no right whatever to exist. Whereas in fact they are severe, constitutionally fixed illnesses, which rarely restrict themselves to only a few attacks but persist as a rule over long periods or throughout life. Our analytic experience that they can be extensively influenced, if the historical precipitating causes and accidental auxiliary factors of the illness can be dealt with, has led us to neglect the constitutional factor in our therapeutic practice, and in any case we can do nothing about it; but in theory we ought always to bear it in mind. The radical inaccessibility of the psychoses to analytic treatment should, in view of their close relationship to the neuroses, restrict our pretensions in regard to these latter. The therapeutic effectiveness of psycho-analysis remains cramped by a number of weighty and scarcely assailable factors. In the case of children, where one might count on the greatest successes, the difficulties are the external ones connected with their relation to their parents, though these difficulties are after all a necessary part of being a child. In the case of adults the difficulties arise in the first instance from two factors: the amount of psychical rigidity present and the form of the illness with all that that covers in the way of deeper determinants.

The first of these factors is often unjustly overlooked. However great may be the plasticity of mental life and the possibility of reviving old conditions, not everything can be brought to life again. Some changes seem to be definitive and correspond to scars formed when a process has run its course. On other occasions one has an impression of a general stiffening of mental life; the psychical processes, to which one could very well indicate other paths, seem incapable of abandoning the old ones. But perhaps this is the same thing as what I mentioned just now, only looked at differently. All too often one seems to see that it is only the treatment's lack of the necessary motive force that prevents one from bringing the change about. One particular dependent relation, one special instinctual component, is too powerful in comparison with the opposing forces that we are able to mobilize. This is quite generally true with the psychoses. We understand them well enough to know the point at which the levers should be applied, but they would not be able to move the weight. It is here, indeed, that hope for the future lies: the possibility that our knowledge of the operation of the hormones (you know what they are) may give us the means of successfully combating the quantitative factors of the illnesses: but we are far from that to-day. I realize that the uncertainty in all these matters is a constant instigation towards perfecting analysis and in particular the transference. Beginners in analysis especially are left in doubt in case of a failure whether they should blame the peculiarities of the case or their own clumsy handling of the therapeutic procedure. But, as I have said already, I do not think much can be achieved by efforts in this direction.

The second limitation upon analytic successes is given by the form of the illness. You know already that the field of application of analytic therapy lies in the transference neuroses - phobias, hysteria, obsessional neurosis - and further, abnormalities of character which have been developed in place of these illnesses. Everything differing from these, narcissistic and psychotic conditions, is unsuitable to a greater or less extent. It would be entirely legitimate to guard against failures by carefully excluding such cases. This precaution would lead to a great improvement in the statistics of analysis. There is, however, a pitfall here. Our diagnoses are very often made only after the event. They resemble the Scottish King's test for identifying witches that I read about in Victor Hugo. This king declared that he was in possession of an infallible method of recognizing a witch. He had the women stewed in a cauldron of boiling water and then tasted the broth. Afterwards he was able to say: 'That was a witch', or 'No, that was not one.' It is the same with us, except that we are the sufferers. We cannot judge the patient who comes for treatment (or, in the same way, the candidate who comes for training) till we have studied him analytically for a few weeks or months. We are in fact buying a pig in a poke. The patient brings along indefinite general ailments which do not admit of a conclusive diagnosis. After this period of testing it may turn out that the case is an unsuitable one. If so we send him away if he is a candidate, or continue the trial a little longer if he is a patient on the chance that we may yet see things in a more favourable light. The patient has his revenge by adding to our list of failures, and the rejected candidate does so perhaps, if he is paranoid, by writing books on psycho-analysis himself. As you see, our precautions have been of no avail.

I am afraid these detailed discussions are exhausting your interest. But I should be still more sorry if you were to think it is my intention to lower your opinion of psycho-analysis as a therapy. Perhaps I really made a clumsy start. For I wanted to do the opposite: to excuse the therapeutic limitations of analysis by pointing out their inevitability. With the same aim in view I turn to another point: the reproach against analytic treatment that it takes a disproportionately long time. On this it must be said that psychical changes do in fact only take place slowly; if they occur rapidly, suddenly, that is a bad sign. It is true that the treatment of a fairly severe neurosis may easily extend over several years; but consider, in case of success, how long the illness would have lasted. A decade, probably, for every year of treatment: the illness, that is to say (as we see so often in untreated cases), would not have ended at all. In some cases we have reasons for resuming an analysis many years afterwards. Life had developed fresh pathological reactions to fresh precipitating causes; but in the meantime our patient had been well. The first analysis had not in fact brought to light all his pathological dispositions, and it was natural for the analysis to have been stopped when success was achieved. There are also severely handicapped people who are kept under analytic supervision all through their lives and are taken back into analysis from time to time. But these people would otherwise have been altogether incapable of existence and we must feel glad that they can be kept on their feet by this piecemeal and recurrent treatment. The analysis of character disorders also calls for long periods of treatment; but it is often successful; and do you know of any other therapy with which such a task could even be approached? Therapeutic ambition may feel unsatisfied by such results; but we have learnt from the example of tuberculosis and lupus that success can only be obtained when the treatment has been adapted to the characteristics of the illness.

I have told you that psycho-analysis began as a method of treatment; but I did not want to commend it to your interest as a method of treatment but on account of the truths it contains, on account of the information it gives us about what concerns human beings most of all - their own nature - and on account of the connections it discloses between the most different of their activities. As a method of treatment it is one among many, though, to be sure, *primus inter pares*. If it was without therapeutic value it would not have been discovered, as it was, in connection with sick people and would not have gone on developing for more than thirty years.

LECTURE XXXV

THE QUESTION OF A WELTANSCHAUUNG

LADIES AND GENTLEMEN, - At our last meeting we were occupied with little everyday concerns - putting our own modest house in order, as it were. I propose that we should now take a bold leap and venture upon answering a question which is constantly being asked in other quarters: does psycho-analysis lead to a particular *Weltanschauung* and, if so, to which?

'*Weltanschauung*' is, I am afraid, a specifically German concept, the translation of which into foreign languages might well raise difficulties. If I try to give you a definition of it, it is bound to seem clumsy to you. In my opinion, then, a *Weltanschauung* is an intellectual construction which solves all the problems of our existence uniformly on the basis of one overriding hypothesis, which, accordingly, leaves no question unanswered and in which everything that interests us finds its fixed place. It will easily be understood that the possession of a *Weltanschauung* of this kind is among the ideal wishes of human beings. Believing in it one can feel secure in life, one can know what to strive for, and how one can deal most expediently with one's emotions and interests.

If that is the nature of a *Weltanschauung*, the answer as regards psycho-analysis is made easy. As a specialist science, a branch of psychology - a depth-psychology or psychology of the unconscious - it is quite unfit to construct a *Weltanschauung* of its own: it must accept the scientific one. But the *Weltanschauung* of science already departs noticeably from our definition. It is true that it too assumes the *uniformity* of the explanation of the universe; but it does so only as a programme, the fulfilment of which is relegated to the future. Apart from this it is marked by negative characteristics, by its limitation to what is at the moment knowable and by its sharp rejection of certain elements that are alien to it. It asserts that there are no sources of knowledge of the universe other than the intellectual working-over of carefully scrutinized observations - in other words, what we call research - and alongside of it no knowledge derived from revelation, intuition or divination. It seems as though this view came very near to being generally recognized in the course of the last few centuries that have passed; and it has been left to *our* century to discover the presumptuous objection that a *Weltanschauung* like this is alike paltry and cheerless, that it overlooks the claims of the human intellect and the needs of the human mind.

This objection cannot be too energetically repudiated. It is quite without a basis, since the intellect and the mind are objects for scientific research in exactly the same way as any non-human things. Psycho-analysis has a special right to speak for the scientific *Weltanschauung* at this point, since it cannot be reproached with having neglected what is mental in the picture of the universe. Its contribution to science lies precisely in having extended research to the mental field. And, incidentally, without such a psychology science would be very incomplete. If, however, the investigation of the intellectual and emotional functions of men (and of animals) is included in science, then it will be seen that nothing is altered in the attitude of science as a whole, that no new sources of knowledge or methods of research have come into being. Intuition and divination would be such, if they existed; but they may safely be reckoned as illusions, the fulfilments of wishful impulses. It is easy to see, too, that these demands upon a *Weltanschauung* are only based on emotion. Science takes notice of the fact that the human mind produces these demands and is ready to examine their sources; but it has not the slightest reason to regard them as justified. On the contrary it sees this as a warning carefully to separate from knowledge everything that is illusion and an outcome of emotional demands like these.

This does not in the least mean that these wishes are to be pushed contemptuously on one side or their value for human life under-estimated. We are ready to trace out the fulfilments of them which they have created for themselves in the products of art and in the systems of religion and philosophy; but we cannot nevertheless overlook the fact that it would be illegitimate and highly inexpedient to allow these demands to be transferred to the sphere of knowledge. For this would be to lay open the paths which lead to psychosis, whether to individual or group psychosis, and would withdraw valuable amounts of energy from endeavours which are directed towards reality in order, so far as possible, to find satisfaction in it for wishes and needs.

From the standpoint of science one cannot avoid exercising one's critical faculty here and proceeding with rejections and dismissals. It is not permissible to declare that science is one field of human mental activity and that religion and philosophy are others, at least its equal in value, and that science has no business to interfere with the other two: that they all have an equal claim to be true and that everyone is at liberty to choose from which he will draw his convictions and in which he will place his belief. A view of this kind is regarded as particularly superior, tolerant, broad-minded and free from illiberal prejudices. Unfortunately it is not tenable and shares all the pernicious features of an entirely unscientific *Weltanschauung* and is equivalent to one in practice. It is simply a fact that the truth cannot be tolerant, that it admits of no compromises or limitations, that research regards every sphere of human activity as belonging to it and that it must be relentlessly critical if any other power tries to take over any part of it.

Of the three powers which may dispute the basic position of science, religion alone is to be taken seriously as an enemy. Art is almost always harmless and beneficent; it does not seek to be anything but an illusion. Except for a few people who are spoken of as being 'possessed' by art, it makes no attempt at invading the realm of reality. Philosophy is not opposed to science, it behaves like a science and works in part by the same methods; it departs from it, however, by clinging to the illusion of being able to present a picture of the universe which is without gaps and is coherent, though one which is bound to collapse with every fresh advance in our knowledge. It goes astray in its method by over-estimating the epistemological value of our logical operations and by accepting other sources of knowledge such as intuition. And it often seems that the poet's derisive comment is not unjustified when he says of the philosopher:

Mit seinen Nachtmützen und Schlafrockfetzen
Stopft er die Lücken des Weltenbaus.¹

¹ Heine.

But philosophy has no direct influence on the great mass of mankind; it is of interest to only a small number even of the top layer of intellectuals and is scarcely intelligible to anyone else. On the other hand, religion is an immense power which has the strongest emotions of human beings at its service. It is well known that at an earlier date it comprised everything that played an intellectual part in men's lives, that it took the place of science when there was scarcely yet such a thing as science, and that it constructed a *Weltanschauung*, consistent and self-contained to an unparalleled degree, which, although it has been profoundly shaken, persists to this day.

If we are to give an account of the grandiose nature of religion, we must bear in mind what it undertakes to do for human beings. It gives them information about the origin and coming into existence of the universe, it assures them of its protection and of ultimate happiness in the ups and downs of life and it directs their thoughts and actions by precepts which it lays down with its whole authority. Thus it fulfils three functions. With the first of them it satisfies the human thirst for knowledge; it does the same thing that science attempts to do with *its* means, and at that point enters into rivalry with it. It is to its second function that it no doubt owes the greatest part of its influence. Science can be no match for it when it soothes the fear that men feel of the dangers and vicissitudes of life, when it assures them of a happy ending and offers them comfort in unhappiness. It is true that science can teach us how to avoid certain dangers and that there are some sufferings which it can successfully combat; it would be most unjust to deny that it is a powerful helper to men; but there are many situations in which it must leave a man to his suffering and can only advise him to submit to it. In its third function, in which it issues precepts and lays down prohibitions and restrictions, religion is furthest away from science. For science is content to investigate and to establish facts, though it is true that from its application rules and advice are derived on the conduct of life. In some circumstances these are the same as those offered by religion, but, when this is so, the reasons for them are different.

The convergence between these three aspects of religion is not entirely clear. What has an explanation of the origin of the universe to do with the inculcation of certain particular ethical precepts? The assurances of protection and happiness are more intimately linked with the ethical requirements. They are the reward for fulfilling these commands; only those who obey them may count upon these benefits, punishment awaits the disobedient. Incidentally, something similar is true of science. Those who disregard its lessons, so it tells us, expose themselves to injury.

The remarkable combination in religion of instruction, consolation and requirements can only be understood if it is subjected to a genetic analysis. This may be approached from the most striking point of the aggregate, from its instruction on the origin of the universe; for why, we may ask, should a cosmogony be a regular component of religious systems? The doctrine is, then, that the universe was created by a being resembling a man, but magnified in every respect, in power, wisdom, and the strength of his passions - an idealized super-man. Animals as creators of the universe point to the influence of totemism, upon which we shall have a few words at least to say presently. It is an interesting fact that this creator is always only a single being, even when there are believed to be many gods. It is interesting, too, that the creator is usually a man, though there is far from being a lack of indications of female deities; and some mythologies actually make the creation begin with a male god getting rid of a female deity, who is degraded into being a monster. Here the most interesting problems of detail open out; but we must hurry on. Our further path is made easy to recognize, for this god-creator is undisguisedly called 'father'. Psycho-analysis infers that he really is the father, with all the magnificence in which he once appeared to the small child. A religious man pictures the creation of the universe just as he pictures his own origin.

This being so, it is easy to explain how it is that consoling assurances and strict ethical demands are combined with a cosmogony. For the same person to whom the child owed his existence, the father (or more correctly, no doubt, the parental agency compounded of the father and mother), also protected and watched over him in his feeble and helpless state, exposed as he was to all the dangers lying in wait in the external world; under his father's protection he felt safe. When a human being has himself grown up, he knows, to be sure, that he is in possession of greater strength, but his insight into the perils of life has also grown greater, and he rightly concludes that fundamentally he still remains just as helpless and unprotected as he was in his childhood, that faced by the world he is still a child. Even now, therefore, he cannot do without the protection which he enjoyed as a child. But he has long since recognized, too, that his father is a being of narrowly restricted power, and not equipped with every excellence. He therefore harks back to the mnemonic image of the father whom in his childhood he so greatly overvalued. He exalts the image into a deity and makes it into something contemporary and real. The effective strength of this mnemonic image and the persistence of his need for protection jointly sustain his belief in God.

The third main item in the religious programme, the ethical demand, also fits into this childhood situation with ease. I may remind you of Kant's famous pronouncement in which he names, in a single breath, the starry heavens and the moral law within us. However strange this juxtaposition may sound - for what have the heavenly bodies to do with the question of whether one human creature loves another or kills him? - it nevertheless touches on a great psychological truth. The same father (or parental agency) which gave the child life and guarded him against its perils, taught him as well what he might do and what he must leave undone, instructed him that he must adapt himself to certain restrictions on his instinctual wishes, and made him understand what regard he was expected to have for his parents and brothers and sisters, if he wanted to become a tolerated and welcome member of the family circle and later on of larger associations. The child is brought up to a knowledge of his social duties by a system of loving rewards and punishments, he is taught that his security in life depends on his parents (and afterwards other people) loving him and on their being able to believe that he loves them. All these relations are afterwards introduced by men unaltered into their religion. Their parents' prohibitions and demands persist within them as a moral conscience. With the help of this same system of rewards and punishments, God rules the world of men. The amount of protection and happy satisfaction assigned to an individual depends on his fulfilment of the ethical demands; his love of God and his consciousness of being loved by God are the foundations of the security with which he is armed against the dangers of the external world and of his human environment. Finally, in prayer he has assured himself a direct influence on the divine will and with it a share in the divine omnipotence.

I feel sure that while you have been listening to me you have been bothered by a number of questions which you would be glad to hear answered. I cannot undertake to do so here and now, but I feel confident that none of these detailed enquiries would upset our thesis that the religious *Weltanschauung* is determined by the situation of our childhood. That being so, it is all the more remarkable that, in spite of its infantile nature, it nevertheless had a precursor. There is no doubt that there was a time without religion, without gods. This is known as the stage of animism. At that time, too, the world was peopled with spiritual beings resembling men - we call them demons. All the objects in the external world were their habitation, or perhaps were identical with them; but there was no superior power which had created them all and afterwards ruled them and to which one could turn for protection and help. The demons of animism were for the most part hostile in their attitude to human beings, but it appears that human beings had more self-confidence then than later on. They were certainly in a constant state of the most acute fear of these evil spirits; but they defended themselves against them by certain actions to which they ascribed the power to drive them away. Nor apart from this did they regard themselves as defenceless. If they desired something from Nature - if they wished for rain, for instance - they did not direct a prayer to the weather-god, but they performed a magical act which they expected to influence Nature directly: they themselves did something which resembled rain. In their struggle against the powers of the world around them their first weapon was *magic*, the earliest fore-runner of the technology of to-day. Their reliance on magic was, as we suppose, derived from their overvaluation of their own intellectual operations, from their belief in the 'omnipotence of thoughts', which, incidentally, we come upon again in our obsessional neurotic patients. We may suppose that human beings at that period were particularly proud of their acquisitions in the way of language, which must have been accompanied by a great facilitation of thinking. They attributed magical power to words. This feature was later taken over by religion. 'And God said "Let there be light!" and there was light.' Moreover the fact of their magical actions shows that animistic men did not simply rely on the power of their wishes. They expected results, rather, from the performance of an action which would induce Nature to imitate it. If they wanted rain, they themselves poured out water; if they wanted to encourage the earth to be fruitful, they demonstrated a dramatic performance of sexual intercourse to it in the fields.

You know how hard it is for anything to die away when once it has achieved psychical expression. So you will not be surprised to hear that many of the utterances of animism have persisted to this day, for the most part as what we call superstition, alongside of and behind religion. But more than this, you will scarcely be able to reject a judgement that the philosophy of today has retained some essential features of the animistic mode of thought - the overvaluation of the magic of words and the belief that the real events in the world take the course which our thinking seeks to impose on them. It would seem, it is true, to be an animism without magical actions. On the other hand, we may suppose that even in those days there were ethics of some sort, precepts upon the mutual relations of men; but nothing suggests that they had any intimate connection with animistic beliefs. They were probably the direct expression of men's relative powers and of their practical needs.

It would be well worth knowing what brought about the transition from animism to religion, but you may imagine the obscurity which to-day still veils these primaeval ages of the evolution of the human spirit. It appears to be a fact that the first form assumed by religion was the remarkable phenomenon of totemism, the worship of animals, in whose train the first ethical commandments, the taboos, made their appearance. In a volume called *Totem and Taboo*, I once elaborated a notion which traced this transformation back to a revolution in the circumstances of the human family. The main achievement of religion as compared with animism lies in the psychical binding of the fear of demons. Nevertheless a vestige of this primaeval age, the Evil Spirit, has kept a place in the religious system.

This being the prehistory of the religious *Weltanschauung* let us turn now to what has happened since then and to what is still going on before our eyes. The scientific spirit, strengthened by the observation of natural processes, has begun, in the course of time, to treat religion as a human affair and to submit it to a critical examination. Religion was not able to stand up to this. What first gave rise to suspicion and scepticism were its tales of miracles, for they contradicted everything that had been taught by sober observation and betrayed too clearly the influence of the activity of the human imagination. After this its doctrines explaining the origin of the universe met with rejection, for they gave evidence of an ignorance which bore the stamp of ancient times and to which, thanks to their increased familiarity with the laws of nature, people knew they were superior. The idea that the universe came into existence through acts of copulation or creation analogous to the origin of individual people had ceased to be the most obvious and self-evident hypothesis since the distinction between animate creatures with a mind and an inanimate Nature had impressed itself on human thought - a distinction which made it impossible to retain belief in the original animism. Nor must we overlook the influence of the comparative study of different religious systems and the impression of their mutual exclusiveness and intolerance.

Strengthened by these preliminary exercises, the scientific spirit gained enough courage at last to venture on an examination of the most important and emotionally valuable elements of the religious *Weltanschauung*. People may always have seen, though it was long before they dared to say so openly, that the pronouncements of religion promising men protection and happiness if they would only fulfil certain ethical requirements had also shown themselves unworthy of belief. It seems not to be the case that there is a Power in the universe which watches over the well-being of individuals with parental care and brings all their affairs to a happy ending. On the contrary, the destinies of mankind can be brought into harmony neither with the hypothesis of a Universal Benevolence nor with the partly contradictory one of a Universal Justice. Earthquakes, tidal waves, conflagrations, make no distinction between the virtuous and pious and the scoundrel or unbeliever. Even where what is in question is not inanimate Nature but where an individual's fate depends on his relations to other people, it is by no means the rule that virtue is rewarded and that evil finds its punishment. Often enough the violent, cunning or ruthless man seizes the envied good things of the world and the pious man goes away empty. Obscure, unfeeling and unloving powers determine men's fate; the system of rewards and punishments which religion ascribes to the government of the universe seems not to exist. Here once again is a reason for dropping a portion of the animistic theory which had been rescued from animism by religion.

The last contribution to the criticism of the religious *Weltanschauung* was effected by psycho-analysis, by showing how religion originated from the helplessness of children and by tracing its contents to the survival into maturity of the wishes and needs of childhood. This did not precisely mean a contradiction of religion, but it was nevertheless a necessary rounding-off of our knowledge about it, and in one respect at least it was a contradiction, for religion itself lays claim to a divine origin. And, to be sure, it is not wrong in this, provided that our interpretation of God is accepted.

In summary, therefore, the judgement of science on the religious *Weltanschauung* is this. While the different religions wrangle with one another as to which of them is in possession of the truth, our view is that the question of the truth of religious beliefs may be left altogether on one side. Religion is an attempt to master the sensory world in which we are situated by means of the wishful world which we have developed within us as a result of biological and psychological necessities. But religion cannot achieve this. Its doctrines bear the imprint of the times in which they arose, the ignorant times of the childhood of humanity. Its consolations deserve no trust. Experience teaches us that the world is no nursery. The ethical demands on which religion seeks to lay stress need, rather, to be given another basis; for they are indispensable to human society and it is dangerous to link obedience to them with religious faith. If we attempt to assign the place of religion in the evolution of mankind, it appears not as a permanent acquisition but as a counterpart to the neurosis which individual civilized men have to go through in their passage from childhood to maturity.

You are of course free to criticize this description of mine; I will even go half way to meet you on this. What I told you about the gradual crumbling away of the religious *Weltanschauung* was certainly incomplete in its abbreviated form. The order of the different processes was not given quite correctly; the co-operation of various forces in the awakening of the scientific spirit was not followed out. I also left out of account the alterations which took place in the religious *Weltanschauung* itself during the period of its undisputed sway and afterwards under the influence of growing criticism. Finally, I restricted my remarks, strictly speaking, to one single form taken by religion, that of the Western peoples. I constructed an anatomical model, so to speak, for the purpose of a hurried demonstration which was to be as impressive as possible. Let us leave on one side the question of whether my knowledge would in any case have been sufficient to do the thing better and more completely. I am aware that you can find everything I said to you said better elsewhere. Nothing in it is new. But let me express a conviction that the most careful working-over of the material of the problems of religion would not shake our conclusions.

The struggle of the scientific spirit against the religious *Weltanschauung* is, as you know, not at an end: it is still going on to-day under our eyes. Though as a rule psycho-analysis makes little use of the weapon of controversy, I will not hold back from looking into this dispute. In doing so I may perhaps throw some further light on our attitude to *Weltanschauungen*. You will see how easily some of the arguments brought forward by the supporters of religion can be answered, though it is true that others may evade refutation.

The first objection we meet with is to the effect that it is an impertinence on the part of science to make religion a subject for its investigations, for religion is something sublime, superior to any operation of the human intellect, something which may not be approached with hair-splitting criticisms. In other words, science is not qualified to judge religion: it is quite serviceable and estimable otherwise, so long as it keeps to its own sphere. But religion is not its sphere, and it has no business there. If we do not let ourselves be put off by this brusque repulse and enquire further what is the basis of this claim to a position exceptional among all human concerns, the reply we receive (if we are thought worthy of any reply) is that religion cannot be measured by human measurements, for it is of divine origin and was given us as a revelation by a Spirit which the human spirit cannot comprehend. One would have thought that there was nothing earlier than the refutation of this argument: it is a clear case of *petitio principii*, of 'begging the question' - I know of no good German equivalent expression. The actual question raised is whether there *is* a divine spirit and a revelation by it; and the matter is certainly not decided by saying that this question cannot be asked, since the deity may not be put in question. The position here is what it occasionally is during the work of analysis. If a usually sensible patient rejects some particular suggestion on specially foolish grounds, this logical weakness is evidence of the existence of a specially strong motive for the denial - a motive which can only be of an affective nature, an emotional tie.

We may also be given another answer, in which a motive of this kind is openly admitted: religion may not be critically examined because it is the highest, most precious, and most sublime thing that the human spirit has produced, because it gives expression to the deepest feelings and alone makes the world tolerable and life worthy of men. We need not reply by disputing this estimate of religion but by drawing attention to another matter. What we do is to emphasize the fact that what is in question is not in the least an invasion of the field of religion by the scientific spirit, but on the contrary an invasion by religion of the sphere of scientific thought. Whatever may be the value and importance of religion, it has no right in any way to restrict thought - no right, therefore, to exclude itself from having thought applied to it.

Scientific thinking does not differ in its nature from the normal activity of thought, which all of us, believers and unbelievers, employ in looking after our affairs in ordinary life. It has only developed certain features: it takes an interest in things even if they have no immediate, tangible use; it is concerned carefully to avoid individual factors and affective influences; it examines more strictly the trustworthiness of the sense-perceptions on which it bases its conclusions; it provides itself with new perceptions which cannot be obtained by everyday means and it isolates the determinants of these new experiences in experiments which are deliberately varied. Its endeavour is to arrive at correspondence with reality - that is to say, with what exists outside us and independently of us and, as experience has taught us, is decisive for the fulfilment or disappointment of our wishes. This correspondence with the real external world we call 'truth'. It remains the aim of scientific work even if we leave the practical value of that work out of account. When, therefore, religion asserts that it can take the place of science, that, because it is beneficent and elevating, it must also be true, that is in fact an invasion which must be repulsed in the most general interest. It is asking a great deal of a person who has learnt to conduct his ordinary affairs in accordance with the rules of experience and with a regard to reality, to suggest that he shall hand over the care of what are precisely his most intimate interests to an agency which claims as its privilege freedom from the precepts of rational thinking. And as regards the protection which religion promises its believers, I think none of us would be so much as prepared to enter a motor-car if its driver announced that he drove, unperturbed by traffic regulations, in accordance with the impulses of his soaring imagination.

The prohibition against thought issued by religion to assist in its self-preservation is also far from being free from danger either for the individual or for human society. Analytic experience has taught us that a prohibition like this, even if it is originally limited to a particular field, tends to widen out and thereafter to become the cause of severe inhibitions in the subject's conduct of life. This result may be observed, too, in the female sex, following from their being forbidden to have anything to do with their sexuality even in thought. Biography is able to point to the damage done by the religious inhibition of thought in the life stories of nearly all eminent individuals in the past. On the other hand intellect - or let us call it by the name that is familiar to us, reason - is among the powers which we may most expect to exercise a unifying influence on men - on men who are held together with such difficulty and whom it is therefore scarcely possible to rule. It may be imagined how impossible human society would be, merely if everyone had his own multiplication table and his own private units of length and weight. Our best hope for the future is that intellect - the scientific spirit, reason - may in process of time establish a dictatorship in the mental life of man. The nature of reason is a guarantee that afterwards it will not fail to give man's emotional impulses and what is determined by them the position they deserve. But the common compulsion exercised by such a dominance of reason will prove to be the strongest uniting bond among men and lead the way to further unions. Whatever, like religion's prohibition against thought, opposes such a development, is a danger for the future of mankind.

It may then be asked why religion does not put an end to this dispute which is so hopeless for it by frankly declaring: 'It is a fact that I cannot give you what is commonly called "truth"; if you want that, you must keep to science. But what I have to offer you is something incomparably more beautiful, more consoling and more uplifting than anything you could get from science. And because of that, I say to you that it is true in another, higher sense.' It is easy to find the answer to this. Religion cannot make this admission because it would involve its forfeiting all its influence on the mass of mankind. The ordinary man only knows one kind of truth, in the ordinary sense of the word. He cannot imagine what a higher or a highest truth may be. Truth seems to him no more capable of comparative degrees than death; and he cannot join in the leap from the beautiful to the true. Perhaps you will think as I do that he is right in this.

So the struggle is not at an end. The supporters of the religious *Weltanschauung* act upon the ancient dictum: the best defence is attack. 'What', they ask, 'is this science which presumes to disparage our religion - our religion which has brought salvation and consolation to millions of people over many thousands of years? What has it accomplished so far? What can we expect from it in the future? On its own admission it is incapable of bringing consolation and exaltation. Let us leave them on one side then, though that is no light renunciation. But what about its theories? Can it tell us how the universe came about and what fate lies before it? Can it even draw us a coherent picture of the universe, or show us where we are to look for the unexplained phenomena of life or how the forces of the mind are able to act upon inert matter? If it could do this we should not refuse it our respect. But none of these, no problem of this kind, has been solved by it hitherto. It gives us fragments of alleged discovery, which it cannot bring into harmony with one another; it collects observations of uniformities in the course of events which it dignifies with the name of laws and submits to its risky interpretations. And consider the small degree of certainty which it attaches to its findings! Everything it teaches is only provisionally true: what is praised to-day as the highest wisdom will be rejected to-morrow and replaced by something else, though once more only tentatively. The latest error is then described as the truth. And for this truth we are to sacrifice our highest good!'

I expect, Ladies and Gentlemen, that, in so far as you yourselves are supporters of the scientific *Weltanschauung* which is attacked in these words, you will not be too profoundly shaken by this criticism. And here I should like to recall to you a remark that once went the rounds in Imperial Austria. The old gentleman once shouted at the Committee of a parliamentary party that was troublesome to him: 'This isn't ordinary opposition any more! It's *factionous* opposition!' Similarly, as you will recognize, the reproaches against science for not having yet solved the problems of the universe are exaggerated in an unjust and malicious manner; it has truly not had time enough yet for these great achievements. Science is very young - a human activity which developed late. Let us bear in mind, to select only a few dates, that only some three hundred years have passed since Kepler discovered the laws of planetary movement, that the life of Newton, who analysed light into the colours of the spectrum and laid down the theory of gravitation, ended in 1727 - that is to say, little more than two hundred years ago - and that Lavoisier discovered oxygen shortly before the French Revolution. The life of an individual is very short in comparison with the duration of human evolution; I may be a very old man to-day, but nevertheless I was already alive when Darwin published his book on the origin of species. In the same year as that, 1859, Pierre Curie, the discoverer of radium, was born. And if you go further back, to the beginnings of exact science among the Greeks, to Archimedes, to Aristarchus of Samos (about 250 B.C.) who was the fore-runner of Copernicus, or even to the first beginnings of astronomy among the Babylonians, you will only have covered a small fraction of the length of time which anthropologists require for the evolution of man from an ape-like ancestral form, and which certainly comprises more than a hundred thousand years. And we must not forget that the last century has brought such a wealth of new discoveries, such a great acceleration of scientific advance that we have every reason to view the future of science with confidence.

We must admit to some extent the correctness of the other criticisms. The path of science is indeed slow, hesitating, laborious. This fact cannot be denied or altered. No wonder the gentlemen in the other camp are dissatisfied. They are spoilt: revelation gave them an easier time. Progress in scientific work is just as it is in an analysis. We bring expectations with us into the work, but they must be forcibly held back. By observation, now at one point and now at another, we come upon something new; but to begin with the pieces do not fit together. We put forward conjectures, we construct hypotheses, which we withdraw if they are not confirmed, we need much patience and readiness for any eventuality, we renounce early convictions so as not to be led by them into overlooking unexpected factors, and in the end our whole expenditure of effort is rewarded, the scattered findings fit themselves together, we get an insight into a whole section of mental events, we have completed our task and now we are free for the next one. In analysis, however, we have to do without the assistance afforded to research by experiment.

Moreover, there is a good deal of exaggeration in this criticism of science. It is not true that it staggers blindly from one experiment to another, that it replaces one error by another. It works as a rule like a sculptor at his clay model, who tirelessly alters his rough sketch, adds to it and takes away from it, till he has arrived at what he feels is a satisfactory degree of resemblance to the object he sees or imagines. Besides, at least in the older and more mature sciences, there is even to-day a solid ground-work which is only modified and improved but no longer demolished. Things are not looking so bad in the business of science.

And what, finally, is the aim of these passionate disparagements of science? In spite of its present incompleteness and of the difficulties attaching to it, it remains indispensable to us and nothing can take its place. It is capable of undreamt-of improvements, whereas the religious *Weltanschauung* is not. This is complete in all essential respects; if it was a mistake, it must remain one for ever. No belittlement of science can in any way alter the fact that it is attempting to take account of our dependence on the real external world, while religion is an illusion and it derives its strength from its readiness to fit in with our instinctual wishful impulses.

I am under an obligation to go on to consider other *Weltanschauungen* which are in opposition to the scientific one; but I do so unwillingly, for I know that I am not properly competent to judge them. So you must bear this proviso in mind in listening to the following remarks, and if your interest has been aroused you should seek better instruction elsewhere.

And here I must first mention the various systems of philosophy which have ventured to draw a picture of the universe as it is reflected in the mind of thinkers who were for the most part turned away from the world. But I have already attempted to give a general account of the characteristics of philosophy and I am probably as unqualified as few people have ever been to form an estimate of the different systems. So I will invite you to join me in turning to a consideration of two other phenomena which, particularly in our days, it is impossible to disregard.

The first of these *Weltanschauungen* is as it were a counterpart to political anarchism, and is perhaps a derivative of it. There have certainly been intellectual nihilists of this kind in the past, but just now the relativity theory of modern physics seems to have gone to their head. They start out from science, indeed, but they contrive to force it into self-abrogation, into suicide; they set it the task of getting itself out of the way by refuting its own claims. One often has an impression in this connection that this nihilism is only a temporary attitude which is to be retained until this task has been performed. Once science has been disposed of, the space vacated may be filled by some kind of mysticism or, indeed, by the old religious *Weltanschauung*. According to the anarchist theory there is no such thing as truth, no assured knowledge of the external world. What we give out as being scientific truth is only the product of our own needs as they are bound to find utterance under changing external conditions: once again, they are illusion. Fundamentally, we find only what we need and see only what we want to see. We have no other possibility. Since the criterion of truth - correspondence with the external world - is absent, it is entirely a matter of indifference what opinions we adopt. All of them are equally true and equally false. And no one has a right to accuse anyone else of error.

A person of an epistemological bent might find it tempting to follow the paths- the sophistries - by which the anarchists succeed in enticing such conclusions from science. No doubt we should come upon situations similar to those derived from the familiar paradox of the Cretan who says that all Cretans are liars. But I have neither the desire nor the capacity for going into this more deeply. All I can say is that the anarchist theory sounds wonderfully superior so long as it relates to opinions about abstract things: it breaks down with its first step into practical life. Now the actions of men are governed by their opinions, their knowledge; and it is the same scientific spirit that speculates about the structure of atoms or the origin of man and that plans the construction of a bridge capable of bearing a load. If what we believe were really a matter of indifference, if there were no such thing as knowledge distinguished among our opinions by corresponding to reality, we might build bridges just as well out of cardboard as out of stone, we might inject our patients with a decagram of morphine instead of a centigram, and might use tear-gas as a narcotic instead of ether. But even the intellectual anarchists would violently repudiate such practical applications of their theory.

The other opposition has to be taken far more seriously, and in this instance I feel the liveliest regret at the inadequacy of my information. I suspect that you know more about this business than I do and that you took up your position long ago in favour of Marxism or against it. Karl Marx's investigations into the economic structure of society and into the influence of different economic systems upon every department of human life have in our days acquired an undeniable authority. How far his views in detail are correct or go astray, I cannot of course tell. I understand that this is not an easy matter even for others better instructed than I am. There are assertions contained in Marx's theory which have struck me as strange: such as that the development of forms of society is a process of natural history, or that the changes in social stratification arise from one another in the manner of a dialectical process. I am far from sure that I understand these assertions aright; nor do they sound to me 'materialistic' but, rather, like a precipitate of the obscure Hegelian philosophy in whose school Marx graduated. I do not know how I can shake off my lay opinion that the class structure of society goes back to the struggles which, from the beginning of history, took place between human hordes only slightly differing from each other. Social distinctions, so I thought, were originally distinctions between clans or races. Victory was decided by psychological factors, such as the amount of constitutional aggressiveness, but also by the firmness of the organization within the horde, and by material factors, such as the possession of superior weapons. Living together in the same area, the victors became the masters and the vanquished the slaves. There is no sign to be seen in this of a natural law or of a conceptual evolution. On the other hand the influence exercised upon the social relations of mankind by progressive control over the forces of Nature is unmistakable. For men always put their newly acquired instruments of power at the service of their aggressiveness and use them against one another. The introduction of metals - bronze and iron - made an end to whole epochs of civilization and their social institutions. I really believe that it was gunpowder and fire-arms that abolished chivalry and aristocratic rule, and that the Russian despotism was already doomed before it lost the War, because no amount of inbreeding among the ruling families of Europe could have produced a race of Tsars capable of withstanding the explosive force of dynamite.

It is possible, indeed, that with our present economic crisis, following after the Great War, we are only paying the price of our latest tremendous victory over nature, the conquest of the air. That does not sound very illuminating, but the first links at least in the chain are clearly recognizable. English politics were based on the security which was guaranteed by the seas that washed her coasts. In the moment at which Blériot flew across the Channel in his aeroplane this protective isolation was breached; and in the night during which (in peace-time and on an exercise) a German Zeppelin cruised over London the war against Germany was no doubt a foregone conclusion.¹ Nor must the U-boat threat be forgotten in this connection.

I am almost ashamed to comment to you on a subject of such importance and complexity with these few inadequate remarks, and I know too that I have told you nothing that is new to you. I merely want to draw your attention to the fact that the relation of mankind to their control over Nature, from which they derive their weapons for fighting their fellow-men, must necessarily also affect their economic arrangements. We seem to have come a long way from the problem of a *Weltanschauung*, but we shall very soon be back to it. The strength of Marxism clearly lies, not in its view of history or the prophecies of the future that are based on it, but in its sagacious indication of the decisive influence which the economic circumstances of men have upon their intellectual, ethical and artistic attitudes. A number of connections and implications were thus uncovered, which had previously been almost totally overlooked. But it cannot be assumed that economic motives are the only ones that determine the behaviour of human beings in society. The undoubted fact that different individuals, races and nations behave differently under the same economic conditions is alone enough to show that economic motives are not the sole dominating factors. It is altogether incomprehensible how psychological factors can be overlooked where what is in question are the reactions of living human beings; for not only were these reactions concerned in establishing the economic conditions, but even under the domination of those conditions men can only bring their original instinctual impulses into play - their self-preservative instinct, their aggressiveness, their need to be loved, their drive towards obtaining pleasure and avoiding unpleasure. In an earlier enquiry I also pointed out the important claims made by the super-ego, which represents tradition and the ideals of the past and will for a time resist the incentives of a new economic situation. And finally we must not forget that the mass of human beings who are subjected to economic necessities also undergo the process of cultural development - of civilization as other people may say - which, though no doubt influenced by all the other factors, is certainly independent of them in its origin, being comparable to an organic process and very well able on its part to exercise an influence on the other factors. It displaces instinctual aims and brings it about that people become antagonistic to what they had previously tolerated. Moreover, the progressive strengthening of the scientific spirit seems to form an essential part of it. If anyone were in a position to show in detail the way in which these different factors - the general inherited human disposition, its racial variations and its cultural transformations - inhibit and promote one another under the conditions of social rank, profession and earning capacity - if anyone were able to do this, he would have supplemented Marxism so that it was made into a genuine social science. For sociology too, dealing as it does with the behaviour of people in society, cannot be anything but applied psychology. Strictly speaking there are only two sciences: psychology, pure and applied, and natural science.

¹ I was told of this from trustworthy sources during the first year of the war.

The newly achieved discovery of the far-reaching importance of economic relations brought with it a temptation not to leave alterations in them to the course of historical development but to put them into effect oneself by revolutionary action. Theoretical Marxism, as realized in Russian Bolshevism, has acquired the energy and the self-contained and exclusive character of a *Weltanschauung*, but at the same time an uncanny likeness to what it is fighting against. Though originally a portion of science and built up, in its implementation, upon science and technology, it has created a prohibition of thought which is just as ruthless as was that of religion in the past. Any critical examination of Marxist theory is forbidden, doubts of its correctness are punished in the same way as heresy was once punished by the Catholic Church. The writings of Marx have taken the place of the Bible and the Koran as a source of revelation, though they would seem to be no more free from contradictions and obscurities than those older sacred books.

And although practical Marxism has mercilessly cleared away all idealistic systems and illusions, it has itself developed illusions which are no less questionable and unprovable than the earlier ones. It hopes in the course of a few generations so to alter human nature that people will live together almost without friction in the new order of society, and that they will undertake the duties of work without any compulsion. Meanwhile it shifts elsewhere the instinctual restrictions which are essential in society; it diverts the aggressive tendencies which threaten all human communities to the outside and finds support in the hostility of the poor against the rich and of the hitherto powerless against the former rulers. But a transformation of human nature such as this is highly improbable. The enthusiasm with which the mass of the people follow the Bolshevik instigation at present, so long as the new order is incomplete and is threatened from outside, gives no certainty for a future in which it would be fully built up and in no danger. In just the same way as religion, Bolshevism too must compensate its believers for the sufferings and deprivations of their present life by promises of a better future in which there will no longer be any unsatisfied need. This Paradise, however, is to be in this life, instituted on earth and thrown open within a foreseeable time. But we must remember that the Jews as well, whose religion knows nothing of an after-life, expected the arrival of a Messiah on earth, and that the Christian Middle Ages at many times believed that the Kingdom of God was at hand.

There is no doubt of how Bolshevism will reply to these objections. It will say that so long as men's nature has not yet been transformed it is necessary to make use of the means which affect them to-day. It is impossible to do without compulsion in their education, without the prohibition of thought and without the employment of force to the point of bloodshed; and if the illusions were not awakened in them, they could not be brought to acquiesce in this compulsion. And we should be politely asked to say how things could be managed differently. This would defeat us. I could think of no advice to give. I should admit that the conditions of this experiment would have deterred me and those like me from undertaking it; but we are not the only people concerned. There are men of action, unshakable in their convictions, inaccessible to doubt, without feeling for the sufferings of others if they stand in the way of their intentions. We have to thank men of this kind for the fact that the tremendous experiment of producing a new order of this kind is now actually being carried out in Russia. At a time when the great nations announce that they expect salvation only from the maintenance of Christian piety, the revolution in Russia - in spite of all its disagreeable details - seems nonetheless like the message of a better future. Unluckily neither our scepticism nor the fanatical faith of the other side gives a hint as to how the experiment will turn out. The future will tell us; perhaps it will show that the experiment was undertaken prematurely, that a sweeping alteration of the social order has little prospect of success until new discoveries have increased our control over the forces of Nature and so made easier the satisfaction of our needs. Only then perhaps may it become possible for a new social order not only to put an end to the material need of the masses but also to give a hearing to the cultural demands of the individual. Even then, to be sure, we shall still have to struggle for an incalculable time with the difficulties which the untameable character of human nature presents to every kind of social community.

Ladies and Gentlemen, - Allow me in conclusion to sum up what I had to say of the relation of psycho-analysis to the question of a *Weltanschauung*. Psycho-analysis, in my opinion, is incapable of creating a *Weltanschauung* of its own. It does not need one; it is a part of science and can adhere to the scientific *Weltanschauung*. This, however, scarcely deserves such a grandiloquent title, for it is not all-comprehensive, it is too incomplete and makes no claim to being self-contained and to the construction of systems. Scientific thought is still very young among human beings; there are too many of the great problems which it has not yet been able to solve. A *Weltanschauung* erected upon science has, apart from its emphasis on the real external world, mainly negative traits, such as submission to the truth and rejection of illusions. Any of our fellow-men who is dissatisfied with this state of things, who calls for more than this for his momentary consolation, may look for it where he can find it. We shall not grudge it him, we cannot help him, but nor can we on his account think differently.

THE ACQUISITION AND CONTROL OF FIRE
(1932)

Intentionally left blank

THE ACQUISITION AND CONTROL OF FIRE

In a footnote to my *Civilization and its Discontents* I mentioned - though only incidentally - a conjecture which could be formed on the basis of psycho-analytic material, about primal man's acquisition of control over fire. I am led to take up this theme again by Albrecht Schaeffer's contradiction (1930) and by Erlenmeyer's striking reference in the preceding paper to the Mongolian law against 'pissing on ashes'.¹

For I think my hypothesis - that, in order to gain control over fire, men had to renounce the homosexually-tinged desire to put it out with a stream of urine - can be confirmed by an interpretation of the Greek myth of Prometheus, provided that we bear in mind the distortions which must be expected to occur in the transition from facts to the contents of a myth. These distortions are of the same sort as, and no worse than, those which we acknowledge every day, when we reconstruct from patients' dreams the repressed but extremely important experiences of their childhood. The mechanisms employed in the distortions I have in mind are symbolic representation and turning into the opposite. I should not venture to explain *all* the features of our myth in this fashion; apart from the original set of facts, other and later occurrences may have contributed to its content. But the elements which admit of analytic interpretation are, after all, the most striking and important - viz. the manner in which Prometheus transported the fire, the character of his act (an outrage, a theft, a defrauding of the gods) and the meaning of his punishment.

¹ This refers no doubt to hot ashes, from which fire can still be obtained, and not to ashes which are quite extinct. - The objection raised by Lorenz (1931) is based on the assumption that man's subjugation of fire only began when he discovered that he could produce it at will by some sort of manipulation. As against this, Dr. J. Hárník refers me to a remark made by Dr. Richard Lasch (in Georg Buschan's compilation *Illustrierte Völkerkunde*, 1922, 1, 24), who writes: 'Presumably the art of *conserving* fire was understood long before that of *kindling* it; we have evidence of this in the fact that, although the present-day pygmy-like aborigines of the Andamans possess and conserve fire, they have no indigenous method of kindling it.'

The myth tells us that Prometheus the Titan, a culture-hero who was still a god¹ and who was perhaps originally himself a demiurge and a creator of men, brought fire to men, having stolen it from the gods, hidden in a hollow stick, a fennel-stalk. If we were interpreting a dream we should be inclined to regard such an object as a penis symbol, although the unusual stress laid on its hollowness might make us hesitate. But how can we bring this penis-tube into connection with the preservation of fire? There seems little chance of doing this, till we remember the procedure of reversal, of turning into the opposite, of inverting relationships, which is so common in dreams and which so often conceals their meaning from us. What a man harbours in his penis-tube is not fire. On the contrary, it is the means of *quenching* fire; it is the water of his stream of urine. This relationship between fire and water then connects up with a wealth of familiar analytic material.

Secondly, the acquisition of fire was a crime; it was accomplished by robbery or theft. This is a constant feature in all the legends about the acquiring of control over fire. It is found among the most different and widely separated peoples and not merely in the Greek myth of Prometheus the Bringer of Fire. Here, then, must be the essential content of mankind's distorted recollection. But why is the acquisition of fire inseparably connected with the idea of a crime? Who is it that was injured or defrauded by it? The Promethean myth in Hesiod gives us a straight answer; for, in another story, not itself directly connected with fire, Prometheus so arranged the sacrifices to the gods as to give men the advantage over Zeus. It is the gods, then, who were defrauded. We know that in myths the gods are granted the satisfaction of all the desires which human creatures have to renounce, as we have learnt from the case of incest. Speaking in analytic terms, we should say that instinctual life - the id - is the god who is defrauded when the quenching of fire is renounced: in the legend, a human desire is transformed into a divine privilege. But in the legend the deity possesses nothing of the characteristics of a super-ego, he is still the representative of the paramount life of the instincts.

¹ Heracles, at a later time, was a demi-god, and Theseus wholly human.

Transformation into the opposite is most radically present in a third feature of the legend, in the punishment of the Bringer of Fire. Prometheus was chained to a rock, and every day a vulture fed on his liver. In the fire-legends of other peoples, too, a bird plays a part, and it must have something to do with the matter; but for the moment I shall not attempt an interpretation. On the other hand, we feel on firm ground when it comes to explaining why the liver was selected as the location of the punishment. In ancient times the liver was regarded as the seat of all passions and desires; hence a punishment like that of Prometheus was the right one for a criminal driven by instinct, who had committed an offence at the prompting of evil desires. But the exact opposite is true of the Bringer of Fire: he had renounced an instinct and had shown how beneficent, and at the same time how indispensable, such a renunciation was for the purposes of civilization. And why should the legend treat a deed that was thus a benefit to civilization as a crime deserving punishment? Well, if, through all its distortions, it barely allows us to get a glimpse of the fact that the acquisition of control over fire presupposes an instinctual renunciation, at least it makes no secret of the resentment which the culture-hero could not fail to arouse in men driven by their instincts. And this is in accordance with what we know and expect. We know that a demand for a renunciation of instinct, and the enforcement of that demand, call out hostility and aggressiveness, which is only transformed into a sense of guilt in a later phase of psychical development.

The obscurity of the Prometheus legend, as of other fire myths, is increased by the fact that primitive man was bound to regard fire as something analogous to the passion of love - or, as we should say, as a symbol of the libido. The warmth that is radiated by fire calls up the same sensation that accompanies a state of sexual excitation, and the shape and movements of a flame suggest a phallus in activity. There can be no doubt about the mythological significance of flame as a phallus; we have further evidence of it in the legend of the parentage of Servius Tullius, the Roman king. When we ourselves speak of the 'devouring fire' of love and of 'licking' flames - thus comparing the flame to a tongue - we have not moved so very far away from the mode of thinking of our primitive ancestors. One of the presuppositions on which we based our account of the myth of the acquisition of fire was, indeed, that to primal man the attempt to quench fire with his own water had the meaning of a pleasurable struggle with another phallus.

It may thus well be that, by way of this symbolic analogy, other elements, of a purely imaginative sort, have made their way into the myth and become interwoven with its historical elements. It is difficult to resist the notion that, if the liver is the seat of passion, its significance, symbolically, is the same as that of fire itself; and that, if this is so, its being daily consumed and renewed gives an apt picture of the behaviour of the erotic desires, which, though daily satisfied, are daily revived. The bird which sates itself on the liver would then have the meaning of a penis - a meaning which is not strange to it in other connections, as we know from legends, dreams, linguistic usage and plastic representations in ancient times. A short step further brings us to the phoenix, the bird which, as often as it is consumed by fire, emerges rejuvenated once more, and which probably bore the significance of a penis revived after its collapse rather than, and earlier than, that of the sun setting in the glow of evening and afterwards rising once again.

The question may be asked whether we may attribute to the mythopoeic activity an attempt to give (in play, as it were) a disguised representation to universally familiar, though also extremely interesting, mental processes that are accompanied by physical manifestations, with no motive other than the sheer pleasure of representation. We can certainly give no decided answer to this question without having fully grasped the nature of myths; but in the two instances before us, it is easy to recognize the same content and, with it, a definite purpose. Each describes the revival of libidinal desires after they have been quenched through being sated. That is to say, each brings out the indestructibility of those desires; and this emphasis is particularly appropriate as a consolation where the historical core of the myth deals with a defeat of instinctual life, with a renunciation of instinct that has become necessary. It is, as it were, the second part of primal man's understandable reaction when he has suffered a blow in his instinctual life: after the punishment of the offender comes the assurance that after all at bottom he has done no damage.

A reversal into the opposite is unexpectedly found in another myth which in appearance has very little to do with the fire myth. The Lernaean hydra with its countless flickering serpent's heads - one of which was immortal - was, as its name tells us, a water-dragon. Heracles, the culture-hero, fought it by cutting off its heads; but they always grew again, and it was only after he had burnt up the immortal head with fire that he overcame the monster. A water-dragon subdued by fire - that surely makes no sense. But, as in so many dreams, sense emerges if we reverse the manifest content. In that case the hydra is a brand of fire and the flickering serpent's heads are the flames; and these, in proof of their libidinal nature, once more display, like Prometheus's liver, the phenomenon of re-growth, of renewal after attempted destruction. Heracles, then, extinguishes this brand of fire with - water. (The immortal head is no doubt the phallus itself, and its destruction signifies castration.) But Heracles was also the deliverer of Prometheus and slew the bird which devoured his liver. Should we not suspect a deeper connection between the two myths? It is as though the deed of the one hero was made up for by the other. Prometheus (like the Mongolian law) had forbidden the quenching of fire; Heracles permitted it in the case in which the brand of fire threatened disaster. The second myth seems to correspond to the reaction of a later epoch of civilization to the events of the acquisition of power over fire. It looks as though this line of approach might take us quite a distance into the secrets of the myth; but admittedly we should carry a feeling of certainty with us only a short way.

In the antithesis between fire and water, which dominates the entire field of these myths, yet a third factor can be demonstrated in addition to the historical factor and the factor of symbolic phantasy. This is a physiological fact, which the poet Heine describes in the following lines:-

Was dem Menschen dient zum Seichen
Damit schaffft er Seinesgleichen.

The sexual organ of the male has two functions; and there are those to whom this association is an annoyance. It serves for the evacuation of the bladder, and it carries out the act of love which sets the craving of the genital libido at rest. The child still believes that he can unite the two functions. According to a theory of his, babies are made by the man urinating into the woman's body. But the adult knows that in reality the acts are mutually incompatible - as incompatible as fire and water. When the penis is in the state of excitation which led to its comparison with a bird, and while the sensations are being experienced which suggest the warmth of fire, urination is impossible; and conversely, when the organ is serving to evacuate urine (the water of the body) all its connections with the genital function seem to be quenched. The antithesis between the two functions might lead us to say that man quenches his own fire with his own water. And primal man, who had to understand the external world by the help of his own bodily sensations and states, would surely not have failed to notice and utilize the analogies pointed out to him by the behaviour of fire.

WHY WAR?
(1933)

(EINSTEIN AND FREUD)

Intentionally left blank

WHY WAR?

Caputh near Potsdam, 30th July, 1932

Dear Professor Freud,

The proposal of the League of Nations and its International Institute of Intellectual Co-operation at Paris that I should invite a person, to be chosen by myself, to a frank exchange of views on any problem that I might select affords me a very welcome opportunity of conferring with you upon a question which, as things now are, seems the most insistent of all the problems civilization has to face. This is the problem: Is there any way of delivering mankind from the menace of war? It is common knowledge that, with the advance of modern science, this issue has come to mean a matter of life and death for civilization as we know it; nevertheless, for all the zeal displayed, every attempt at its solution has ended in a lamentable breakdown.

I believe, moreover, that those whose duty it is to tackle the problem professionally and practically are growing only too aware of their impotence to deal with it, and have now a very lively desire to learn the views of men who, absorbed in the pursuit of science, can see world-problems in the perspective distance lends. As for me, the normal objective of my thought affords no insight into the dark places of human will and feeling. Thus, in the enquiry now proposed, I can do little more than seek to clarify the question at issue and, clearing the ground of the more obvious solutions, enable you to bring the light of your far-reaching knowledge of man's instinctive life to bear upon the problem. There are certain psychological obstacles whose existence a layman in the mental sciences may dimly surmise, but whose interrelations and vagaries he is incompetent to fathom; you, I am convinced, will be able to suggest educative methods, lying more or less outside the scope of politics, which will eliminate these obstacles.

As one immune from nationalist bias, I personally see a simple way of dealing with the superficial (i.e. administrative) aspect of the problem: the setting up, by international consent, of a legislative and judicial body to settle every conflict arising between nations. Each nation would undertake to abide by the orders issued by this legislative body, to invoke its decision in every dispute, to accept its judgements unreservedly and to carry out every measure the tribunal deems necessary for the execution of its decrees. But here, at the outset, I come up against a difficulty; a tribunal is a human institution which, in proportion as the power at its disposal is inadequate to enforce its verdicts, is all the more prone to suffer these to be deflected by extrajudicial pressure. This is a fact with which we have to reckon; law and might inevitably go hand in hand, and juridical decisions approach more nearly the ideal justice demanded by the community (in whose name and interests these verdicts are pronounced) in so far as the community has effective power to compel respect of its juridical ideal. But at present we are far from possessing any supranational organization competent to render verdicts of incontestable authority and enforce absolute submission to the execution of its verdicts. Thus I am led to my first axiom: the quest of international security involves the unconditional surrender by every nation, in a certain measure, of its liberty of action, its sovereignty that is to say, and it is clear beyond all doubt that no other road can lead to such security.

The ill-success, despite their obvious sincerity, of all the efforts made during the last decade to reach this goal leaves us no room to doubt that strong psychological factors are at work, which paralyse these efforts. Some of these factors are not far to seek. The craving for power which characterizes the governing class in every nation is hostile to any limitation of the national sovereignty. This political power-hunger is wont to batten on the activities of another group, whose aspirations are on purely mercenary, economic lines. I have specially in mind that small but determined group, active in every nation, composed of individuals who, indifferent to social considerations and restraints, regard warfare, the manufacture and sale of arms, simply as an occasion to advance their personal interests and enlarge their personal authority.

But recognition of this obvious fact is merely the first step towards an appreciation of the actual state of affairs. Another question follows hard upon it: How is it possible for this small clique to bend the will of the majority, who stand to lose and suffer by a state of war, to the service of their ambitions? (In speaking of the majority, I do not exclude soldiers of every rank who have chosen war as their profession, in the belief that they are serving to defend the highest interests of their race, and that attack is often the best method of defence.) An obvious answer to this question would seem to be that the minority, the ruling class at present, has the schools and press, usually the Church as well, under its thumb. This enables it to organize and sway the emotions of the masses, and make its tool of them.

Yet even this answer does not provide a complete solution. Another question arises from it: How is it these devices succeed so well in rousing men to such wild enthusiasm, even to sacrifice their lives? Only one answer is possible. Because man has within him a lust for hatred and destruction. In normal times this passion exists in a latent state, it emerges only in unusual circumstances; but it is a comparatively easy task to call it into play and raise it to the power of a collective psychosis. Here lies, perhaps, the crux of all the complex of factors we are considering, an enigma that only the expert in the lore of human instincts can resolve.

And so we come to our last question. Is it possible to control man's mental evolution so as to make him proof against the psychoses of hate and destructiveness? Here I am thinking by no means only of the so-called uncultured masses. Experience proves that it is rather the so-called 'Intelligentzia' that is most apt to yield to these disastrous collective suggestions, since the intellectual has no direct contact with life in the raw, but encounters it in its easiest synthetic form - upon the printed page.

To conclude: I have so far been speaking only of wars between nations; what are known as international conflicts. But I am well aware that the aggressive instinct operates under other forms and in other circumstances. (I am thinking of civil wars, for instance, due in earlier days to religious zeal, but nowadays to social factors; or, again, the persecution of racial minorities.) But my insistence on what is the most typical, most cruel and extravagant form of conflict between man and man was deliberate, for here we have the best occasion of discovering ways and means to render all armed conflicts impossible.

I know that in your writings we may find answers, explicit or implied, to all the issues of this urgent and absorbing problem. But it would be of the greatest service to us all were you to present the problem of world peace in the light of your most recent discoveries, for such a presentation well might blaze the trail for new and fruitful modes of action.

Yours very sincerely,
A. EINSTEIN.

Why War?

4792

Vienna, September, 1932.

Dear Professor Einstein,

When I heard that you intended to invite me to an exchange of views on some subject that interested you and that seemed to deserve the interest of others besides yourself, I readily agreed. I expected you to choose a problem on the frontiers of what is knowable to-day, a problem to which each of us, a physicist and a psychologist, might have our own particular angle of approach and where we might come together from different directions upon the same ground. You have taken me by surprise, however, by posing the question of what can be done to protect mankind from the curse of war. I was scared at first by the thought of my - I had almost written 'our' - incapacity for dealing with what seemed to be a practical problem, a concern for statesmen. But I then realized that you had raised the question not as a natural scientist and physicist but as a philanthropist: you were following the promptings of the League of Nations just as Fridtjof Nansen, the polar explorer, took on the work of bringing help to the starving and homeless victims of the World War. I reflected, moreover, that I was not being asked to make practical proposals but only to set out the problem of avoiding war as it appears to a psychological observer. Here again you yourself have said almost all there is to say on the subject. But though you have taken the wind out of my sails I shall be glad to follow in your wake and content myself with confirming all you have said by amplifying it to the best of my knowledge - or conjecture.

You begin with the relation between Right and Might. There can be no doubt that that is the correct starting-point for our investigation. But may I replace the word 'might' by the balder and harsher word 'violence'? To-day right and violence appear to us as antitheses. It can easily be shown, however, that the one has developed out of the other; and, if we go back to the earliest beginnings and see how that first came about, the problem is easily solved. You must forgive me if in what follows I go over familiar and commonly accepted ground as though it were new, but the thread of my argument requires it.

It is a general principle, then, that conflicts of interest between men are settled by the use of violence. This is true of the whole animal kingdom, from which men have no business to exclude themselves. In the case of men, no doubt, conflicts of *opinion* occur as well which may reach the highest pitch of abstraction and which seem to demand some other technique for their settlement. That, however, is a later complication. To begin with, in a small human horde, it was superior muscular strength which decided who owned things or whose will should prevail. Muscular strength was soon supplemented and replaced by the use of tools: the winner was the one who had the better weapons or who used them the more skilfully. From the moment at which weapons were introduced, intellectual superiority already began to replace brute muscular strength; but the final purpose of the fight remained the same - one side or the other was to be compelled to abandon his claim or his objection by the damage inflicted on him and by the crippling of his strength. That purpose was most completely achieved if the victor's violence eliminated his opponent permanently - that is to say, killed him. This had two advantages: he could not renew his opposition and his fate deterred others from following his example. In addition to this, killing an enemy satisfied an instinctual inclination which I shall have to mention later. The intention to kill might be countered by a reflection that the enemy could be employed in performing useful services if he were left alive in an intimidated condition. In that case the victor's violence was content with subjugating him instead of killing him. This was a first beginning of the idea of sparing an enemy's life, but thereafter the victor had to reckon with his defeated opponent's lurking thirst for revenge and sacrificed some of his own security.

Such, then, was the original state of things: domination by whoever had the greater might - domination by brute violence or by violence supported by intellect. As we know, this régime was altered in the course of evolution. There was a path that led from violence to right or law. What was that path? It is my belief that there was only one: the path which led by way of the fact that the superior strength of a single individual could be rivalled by the union of several weak ones. '*L'union fait la force.*' Violence could be broken by union, and the power of those who were united now represented law in contrast to the violence of the single individual. Thus we see that right is the might of a community. It is still violence, ready to be directed against any individual who resists it; it works by the same methods and follows the same purposes. The only real difference lies in the fact that what prevails is no longer the violence of an individual but that of a community. But in order that the transition from violence to this new right or justice may be effected, one psychological condition must be fulfilled. The union of the majority must be a stable and lasting one. If it were only brought about for the purpose of combating a single dominant individual and were dissolved after his defeat, nothing would have been accomplished. The next person who thought himself superior in strength would once more seek to set up a dominion by violence and the game would be repeated *ad infinitum*. The community must be maintained permanently, must be organized, must draw up regulations to anticipate the risk of rebellion and must institute authorities to see that those regulations - the laws - are respected and to superintend the execution of legal acts of violence. The recognition of a community of interests such as these leads to the growth of emotional ties between the members of a united group of people - communal feelings which are the true source of its strength.

Here, I believe, we already have all the essentials: violence overcome by the transference of power to a larger unity, which is held together by emotional ties between its members. What remains to be said is no more than an expansion and a repetition of this.

The situation is simple so long as the community consists only of a number of equally strong individuals. The laws of such an association will determine the extent to which, if the security of communal life is to be guaranteed, each individual must surrender his personal liberty to turn his strength to violent uses. But a state of rest of that kind is only theoretically conceivable. In actuality the position is complicated by the fact that from its very beginning the community comprises elements of unequal strength - men and women, parents and children - and soon, as a result of war and conquest, it also comes to include victors and vanquished, who turn into masters and slaves. The justice of the community then becomes an expression of the unequal degrees of power obtaining within it; the laws are made by and for the ruling members and find little room for the rights of those in subjection. From that time forward there are two factors at work in the community which are sources of unrest over matters of law but tend at the same time to a further growth of law. First, attempts are made by certain of the rulers to set themselves above the prohibitions which apply to everyone - they seek, that is, to go back from a dominion of law to a dominion of violence. Secondly, the oppressed members of the group make constant efforts to obtain more power and to have any changes that are brought about in that direction recognized in the laws - they press forward, that is, from unequal justice to equal justice for all. This second tendency becomes especially important if a real shift of power occurs within a community, as may happen as a result of a number of historical factors. In that case right may gradually adapt itself to the new distribution of power; or, as is more frequent, the ruling class is unwilling to recognize the change, and rebellion and civil war follow, with a temporary suspension of law and new attempts at a solution by violence, ending in the establishment of a fresh rule of law. There is yet another source from which modifications of law may arise, and one of which the expression is invariably peaceful: it lies in the cultural transformation of the members of the community. This, however, belongs properly in another connection and must be considered later.

Thus we see that the violent solution of conflicts of interest is not avoided even inside a community. But the everyday necessities and common concerns that are inevitable where people live together in one place tend to bring such struggles to a swift conclusion and under such conditions there is an increasing probability that a peaceful solution will be found. Yet a glance at the history of the human race reveals an endless series of conflicts between one community and another or several others, between larger and smaller units - between cities, provinces, races, nations, empires - which have almost always been settled by force of arms. Wars of this kind end either in the spoliation or in the complete overthrow and conquest of one of the parties. It is impossible to make any sweeping judgement upon war of conquest. Some, such as those waged by the Mongols and Turks, have brought nothing but evil. Others, on the contrary, have contributed to the transformation of violence into law by establishing larger units within which the use of violence was made impossible and in which a fresh system of law led to the solution of conflicts. In this way the conquests of the Romans gave the countries round the Mediterranean the priceless *pax Romana*, and the greed of the French kings to extend their dominions created a peacefully united and flourishing France. Paradoxical as it may sound, it must be admitted that war might be a far from inappropriate means of establishing the eagerly desired reign of 'everlasting' peace, since it is in a position to create the large units within which a powerful central government makes further wars impossible. Nevertheless it fails in this purpose, for the results of conquest are as a rule short-lived: the newly created units fall apart once again, usually owing to a lack of cohesion between the portions that have been united by violence. Hitherto, moreover, the unifications created by conquest, though of considerable extent, have only been *partial*, and the conflicts between these have called out more than ever for violent solution. Thus the result of all these warlike efforts has only been that the human race has exchanged numerous, and indeed unending, minor wars for wars on a grand scale that are rare but all the more destructive.

If we turn to our own times, we arrive at the same conclusion which you have reached by a shorter path. Wars will only be prevented with certainty if mankind unites in setting up a central authority to which the right of giving judgement upon all conflicts of interest shall be handed over. There are clearly two separate requirements involved in this: the creation of a supreme agency and its endowment with the necessary power. One without the other would be useless. The League of Nations is designed as an agency of this kind, but the second condition has not been fulfilled: the League of Nations has no power of its own and can only acquire it if the members of the new union, the separate States, are ready to resign it. And at the moment there seems very little prospect of this. The institution of the League of Nations would, however, be wholly unintelligible if one ignored the fact that here was a bold attempt such as has seldom (perhaps, indeed, never on such a scale) been made before. It is an attempt to base upon an appeal to certain idealistic attitudes of mind the authority (that is, the coercive influence) which otherwise rests on the possession of power. We have seen that a community is held together by two things: the compelling force of violence and the emotional ties (identifications is the technical name) between its members. If one of the factors is absent, the community may possibly be held together by the other. The ideas that are appealed to can, of course, only have any significance if they give expression to important affinities between the members, and the question arises of how much strength such ideas can exert. History teaches us that they have been to some extent effective. For instance, the Panhellenic idea, the sense of being superior to the surrounding barbarians - an idea which was so powerfully expressed in the Amphictyonic Council, the Oracles and the Games - was sufficiently strong to mitigate the customs of war among Greeks, though evidently not sufficiently strong to prevent warlike disputes between the different sections of the Greek nation or even to restrain a city or confederation of cities from allying itself with the Persian foe in order to gain an advantage over a rival. The community of feeling among Christians, powerful though it was, was equally unable at the time of the Renaissance to deter Christian States, whether large or small, from seeking the Sultan's aid in their wars with one another. Nor does any idea exist to-day which could be expected to exert a unifying authority of the sort. Indeed it is all too clear that the national ideals by which nations are at present swayed operate in a contrary direction. Some people are inclined to prophesy that it will not be possible to make an end of war until Communist ways of thinking have found universal acceptance. But that aim is in any case a very remote one to-day, and perhaps it could only be reached after the most fearful civil wars. Thus the attempt to replace actual force by the force of ideas seems at present to be doomed to failure. We shall be making a false calculation if we disregard the fact that law was originally brute violence and that even to-day it cannot do without the support of violence.

I can now proceed to add a gloss to another of your remarks. You express astonishment at the fact that it is so easy to make men enthusiastic about a war and add your suspicions that there is something at work in them - an instinct for hatred and destruction - which goes halfway to meet the efforts of the warmongers. Once again, I can only express my entire agreement. We believe in the existence of an instinct of that kind and have in fact been occupied during the last few years in studying its manifestations. Will you allow me to take this opportunity of putting before you a portion of the theory of the instincts which, after much tentative groping and many fluctuations of opinion, has been reached by workers in the field of psycho-analysis?

According to our hypothesis human instincts are of only two kinds: those which seek to preserve and unite - which we call 'erotic', exactly in the sense in which Plato uses the word 'Eros' in his *Symposium*, or 'sexual', with a deliberate extension of the popular conception of 'sexuality' - and those which seek to destroy and kill and which we group together as the aggressive or destructive instinct. As you see, this is in fact no more than a theoretical clarification of the universally familiar opposition between Love and Hate which may perhaps have some fundamental relation to the polarity of attraction and repulsion that plays a part in your own field of knowledge. But we must not be too hasty in introducing ethical judgements of good and evil. Neither of these instincts is any less essential than the other; the phenomena of life arise from the concurrent or mutually opposing action of both. Now it seems as though an instinct of the one sort can scarcely ever operate in isolation; it is always accompanied - or, as we say, alloyed - with a certain quota from the other side, which modifies its aim or is, in some cases, what enables it to achieve that aim. Thus, for instance, the instinct of self-preservation is certainly of an erotic kind, but it must nevertheless have aggressiveness at its disposal if it is to fulfil its purpose. So, too, the instinct of love, when it is directed towards an object, stands in need of some contribution from the instinct for mastery if it is in any way to obtain possession of that object. The difficulty of isolating the two classes of instinct in their actual manifestations is indeed what has so long prevented us from recognizing them.

If you will follow me a little further, you will see that human actions are subject to another complication of a different kind. It is very rarely that an action is the work of a *single* instinctual impulse (which must in itself be compounded of Eros and destructiveness). In order to make an action possible there must be as a rule a combination of such compounded motives. This was perceived long ago by a specialist in your own subject, a Professor G. C. Lichtenberg who taught physics at Göttingen during our classical age - though perhaps he was even more remarkable as a psychologist than as a physicist. He invented a Compass of Motives, for he wrote: 'The motives that lead us to do anything might be arranged like the thirty-two winds and might be given names in a similar way: for instance, "bread-bread-fame" or "fame-fame-bread".' So that when human beings are incited to war they may have a whole number of motives for assenting - some noble and some base, some which are openly declared and others which are never mentioned. There is no need to enumerate them all. A lust for aggression and destruction is certainly among them: the countless cruelties in history and in our everyday lives vouch for its existence and its strength. The satisfaction of these destructive impulses is of course facilitated by their admixture with others of an erotic and idealistic kind. When we read of the atrocities of the past, it sometimes seems as though the idealistic motives served only as an excuse for the destructive appetites; and sometimes - in the case, for instance, of the cruelties of the Inquisition - it seems as though the idealistic motives had pushed themselves forward in consciousness, while the destructive ones lent them an unconscious reinforcement. Both may be true.

I fear I may be abusing your interest, which is after all concerned with the prevention of war and not with our theories. Nevertheless I should like to linger for a moment over our destructive instinct, whose popularity is by no means equal to its importance. As a result of a little speculation, we have come to suppose that this instinct is at work in every living creature and is striving to bring it to ruin and to reduce life to its original condition of inanimate matter. Thus it quite seriously deserves to be called a death instinct, while the erotic instincts represent the effort to live. The death instinct turns into the destructive instinct when, with the help of special organs, it is directed outwards, on to objects. The organism preserves its own life, so to say, by destroying an extraneous one. Some portion of the death instinct, however, remains operative *within* the organism, and we have sought to trace quite a number of normal and pathological phenomena to this internalization of the destructive instinct. We have even been guilty of the heresy of attributing the origin of conscience to this diversion inwards of aggressiveness. You will notice that it is by no means a trivial matter if this process is carried too far: it is positively unhealthy. On the other hand if these forces are turned to destruction in the external world, the organism will be relieved and the effect must be beneficial. This would serve as a biological justification for all the ugly and dangerous impulses against which we are struggling. It must be admitted that they stand nearer to Nature than does our resistance to them for which an explanation also needs to be found. It may perhaps seem to you as though our theories are a kind of mythology and, in the present case, not even an agreeable one. But does not every science come in the end to a kind of mythology like this? Cannot the same be said to-day of your own Physics?

For our immediate purpose then, this much follows from what has been said: there is no use in trying to get rid of men's aggressive inclinations. We are told that in certain happy regions of the earth, where nature provides in abundance everything that man requires, there are races whose life is passed in tranquillity and who know neither coercion nor aggression. I can scarcely believe it and I should be glad to hear more of these fortunate beings. The Russian Communists, too, hope to be able to cause human aggressiveness to disappear by guaranteeing the satisfaction of all material needs and by establishing equality in other respects among all the members of the community. That, in my opinion, is an illusion. They themselves are armed to-day with the most scrupulous care and not the least important of the methods by which they keep their supporters together is hatred of everyone beyond their frontiers. In any case, as you yourself have remarked, there is no question of getting rid entirely of human aggressive impulses; it is enough to try to divert them to such an extent that they need not find expression in war.

Our mythological theory of instincts makes it easy for us to find a formula for *indirect* methods of combating war. If willingness to engage in war is an effect of the destructive instinct, the most obvious plan will be to bring Eros, its antagonist, into play against it. Anything that encourages the growth of emotional ties between men must operate against war. These ties may be of two kinds. In the first place they may be relations resembling those towards a loved object, though without having a sexual aim. There is no need for psycho-analysis to be ashamed to speak of love in this connection, for religion itself uses the same words: 'Thou shalt love thy neighbour as thyself.' This, however, is more easily said than done. The second kind of emotional tie is by means of identification. Whatever leads men to share important interests produces this community of feeling, these identifications. And the structure of human society is to a large extent based on them.

A complaint which you make about the abuse of authority brings me to another suggestion for the indirect combating of the propensity to war. One instance of the innate and ineradicable inequality of men is their tendency to fall into the two classes of leaders and followers. The latter constitute the vast majority; they stand in need of an authority which will make decisions for them and to which they for the most part offer an unqualified submission. This suggests that more care should be taken than hitherto to educate an upper stratum of men with independent minds, not open to intimidation and eager in the pursuit of truth, whose business it would be to give direction to the dependent masses. It goes without saying that the encroachments made by the executive power of the State and the prohibition laid by the Church upon freedom of thought are far from propitious for the production of a class of this kind. The ideal condition of things would of course be a community of men who had subordinated their instinctual life to the dictatorship of reason. Nothing else could unite men so completely and so tenaciously, even if there were no emotional ties between them. But in all probability that is a Utopian expectation. No doubt the other indirect methods of preventing war are more practicable, though they promise no rapid success. An unpleasant picture comes to one's mind of mills that grind so slowly that people may starve before they get their flour.

The result, as you see, is not very fruitful when an unworldly theoretician is called in to advise on an urgent practical problem. It is a better plan to devote oneself in every particular case to meeting the danger with whatever means lie to hand. I should like, however, to discuss one more question, which you do not mention in your letter but which specially interests me. Why do you and I and so many other people rebel so violently against war? Why do we not accept it as another of the many painful calamities of life? After all, it seems to be quite a natural thing, to have a good biological basis and in practice to be scarcely avoidable. There is no need to be shocked at my raising this question. For the purpose of an investigation such as this, one may perhaps be allowed to wear a mask of assumed detachment. The answer to my question will be that we react to war in this way because everyone has a right to his own life, because war puts an end to human lives that are full of hope, because it brings individual men into humiliating situations, because it compels them against their will to murder other men, and because it destroys precious material objects which have been produced by the labours of humanity. Other reasons besides might be given, such as that in its present-day form war is no longer an opportunity for achieving the old ideals of heroism and that owing to the perfection of instruments of destruction a future war might involve the extermination of one or perhaps both of the antagonists. All this is true, and so incontestably true that one can only feel astonished that the waging of war has not yet been unanimously repudiated. No doubt debate is possible upon one or two of these points. It may be questioned whether a community ought not to have a right to dispose of individual lives; every war is not open to condemnation to an equal degree; so long as there exist countries and nations that are prepared for the ruthless destruction of others, those others must be armed for war. But I will not linger over any of these issues; they are not what you want to discuss with me, and I have something different in mind. It is my opinion that the main reason why we rebel against war is that we cannot help doing so. We are pacifists because we are obliged to be for organic reasons. And we then find no difficulty in producing arguments to justify our attitude.

No doubt this requires some explanation. My belief is this. For incalculable ages mankind has been passing through a process of evolution of culture. (Some people, I know, prefer to use the term 'civilization'.) We owe to that process the best of what we have become, as well as a good part of what we suffer from. Though its causes and beginnings are obscure and its outcome uncertain, some of its characteristics are easy to perceive. It may perhaps be leading to the extinction of the human race, for in more than one way it impairs the sexual function; uncultivated races and backward strata of the population are already multiplying more rapidly than highly cultivated ones. The process is perhaps comparable to the domestication of certain species of animals and it is undoubtedly accompanied by physical alterations; but we are still unfamiliar with the notion that the evolution of civilization is an organic process of this kind. The *psychical* modifications that go along with the process of civilization are striking and unambiguous. They consist in a progressive displacement of instinctual aims and a restriction of instinctual impulses. Sensations which were pleasurable to our ancestors have become indifferent or even intolerable to ourselves; there are organic grounds for the changes in our ethical and aesthetic ideals. Of the psychological characteristics of civilization two appear to be the most important: a strengthening of the intellect, which is beginning to govern instinctual life, and an internalization of the aggressive impulses, with all its consequent advantages and perils. Now war is in the crassest opposition to the psychical attitude imposed on us by the process of civilization, and for that reason we are bound to rebel against it; we simply cannot any longer put up with it. This is not merely an intellectual and emotional repudiation; we pacifists have a *constitutional* intolerance of war, an idiosyncrasy magnified, as it were, to the highest degree. It seems, indeed, as though the lowering of aesthetic standards in war plays a scarcely smaller part in our rebellion than do its cruelties.

Why War?

4804

And how long shall we have to wait before the rest of mankind become pacifists too? There is no telling. But it may not be Utopian to hope that these two factors, the cultural attitude and the justified dread of the consequences of a future war, may result within a measurable time in putting an end to the waging of war. By what paths or by what side-tracks this will come about we cannot guess. But one thing we *can* say: whatever fosters the growth of civilization works at the same time against war.

I trust you will forgive me if what I have said has disappointed you, and I remain, with kindest regards,

Sincerely yours,

SIGM. FREUD

MY CONTACT WITH JOSEF POPPER-LYNKEUS
(1932)

Intentionally left blank

MY CONTACT WITH JOSEF POPPER-LYNKEUS

It was in the winter of 1899 that my book on *The Interpretation of Dreams* (though its title-page was post-dated into the new century) at length lay before me. This work was the product of the labours of four or five years and its origin was unusual. Holding a lectureship in Nervous Diseases at the University, I had attempted to support myself and my rapidly increasing family by a medical practice among the so-called 'neurotics' of whom there were only too many in our society. But the task proved harder than I had expected. The ordinary methods of treatment clearly offered little or no help: other paths must be followed. And how was it by any means possible to give patients help when one understood nothing of their illness, nothing of the causes of their sufferings or of the meaning of their complaints? So I eagerly sought direction and instruction from the great Charcot in Paris and from Bernheim at Nancy; finally, an observation made by my teacher and friend, Josef Breuer of Vienna, seemed to open a new prospect for understanding and therapeutic success.

For these new experiments made it a certainty that the patients whom we described as neurotic were in some sense suffering from *mental* disturbances and ought therefore to be treated by psychological methods. Our interest therefore necessarily turned to psychology. The psychology which ruled at that time in the academic schools of philosophy had very little to offer and nothing at all for our purposes: we had to discover from the start both our methods and the theoretical hypotheses behind them. So I worked in this direction, first in collaboration with Breuer and afterwards independently of him. In the end I made it a part of my technique to require my patients to tell me without criticism whatever occurred to their minds, even if they were ideas which did not seem to make sense or which it was distressing to report.

When they fell in with my instructions they told me their dreams, amongst other things, as though they were of the same kind as their other thoughts. This was a plain hint that I should assign as much importance to these dreams as to other, intelligible, phenomena. They, however, were *not* intelligible, but strange, confused, absurd: like dreams, in fact - which for that very reason, were condemned by science as random and senseless twitchings of the organ of the mind. If my patients were right - and they seemed only to be repeating the ancient beliefs held by unscientific men for thousands of years - I was faced by the task of 'interpreting dreams' in a way that could stand up against scientific criticism.

To begin with, I naturally understood no more about my patients' dreams than the dreamers did themselves. But by applying to these dreams, and more particularly to my own dreams, the procedure which I had already used for the study of other abnormal psychological structures, I succeeded in answering most of the questions which could be raised by an interpretation of dreams. There were many such questions: What do we dream about? Why do we dream at all? What is the origin of all the strange characteristics which distinguish dreams from waking life? - and many more such questions besides. Some of the answers were easily given and turned out to confirm views that had already been put forward; but others involved completely new hypotheses with regard to the structure and functioning of the apparatus of the mind. People dream about the things that have engaged their minds during the waking day. People dream in order to allay impulses that seek to disturb sleep, and in order to be able to sleep on. But why was it possible for dreams to present such a strange appearance, so confusedly senseless, so obviously contrasted with the content of waking thought, in spite of being concerned with the same material? There could be no doubt that dreams were only a substitute for a rational process of thought and could be interpreted - that is to say, translated into a rational process. But what needed explaining was the fact of the *distortion* which the dream-work had carried out upon the rational and intelligible material.

Dream-distortion was the profoundest and most difficult problem of dream life. And light was thrown on it by the following consideration, which placed dreams in a class along with other psychopathological formations and revealed them, as it were, as the normal psychoses of human beings. For our mind, that precious instrument by whose means we maintain ourselves in life, is no peacefully self-contained unity. It is rather to be compared with a modern State in which a mob, eager for enjoyment and destruction, has to be held down forcibly by a prudent superior class. The whole flux of our mental life and everything that finds expression in our thoughts are derivations and representatives of the multifarious instincts that are innate in our physical constitution. But these instincts are not all equally susceptible to direction and education, or equally ready to fall in with the demands of the external world and of human society. A number of them have retained their primitive, ungovernable nature; if we let them have their way, they would infallibly bring us to ruin. Consequently, learning by experience, we have developed organizations in our mind which, in the form of inhibitions, set themselves up against the direct manifestations of the instincts. Every impulse in the nature of a wish that arises from the sources of instinctual energy must submit itself to examination by the highest agencies of our mind, and, if it is not approved, is rejected and restrained from exercising any influence upon our movements - that is, from coming into execution. Often enough, indeed, such wishes are even forbidden to enter consciousness, which is habitually unaware even of the existence of these dangerous instinctual sources. We describe such impulses as being *repressed* from the point of view of consciousness, and as surviving only in the unconscious. If what is repressed contrives somehow to force its way into consciousness or into movement or into both, we are no longer normal: at that point the whole range of neurotic and psychotic symptoms arise. The maintenance of the necessary inhibitions and repressions imposes upon our mind a great expenditure of energy, from which it is glad to be relieved. A good opportunity for this seems to be offered at night by the state of sleep, since sleep involves a cessation of our motor functions. The situation seems safe, and the severity of our internal police-force may therefore be relaxed. It is not entirely withdrawn, since one cannot be certain: it may be that the unconscious never sleeps at all. And now the reduction of pressure upon the repressed unconscious produces its effect. Wishes arise from it which during sleep might find the entrance to consciousness open. If we were to know them we should be appalled, alike by their subject-matter, their unrestraint and indeed the mere possibility of their existence. This, however, occurs only seldom, and when it does we awake as speedily as possible, in a state of fear. But as a rule our consciousness does not experience the dream as it really was. It is true that the inhibitory forces (the *dream censorship*, as we may call them) are not completely awake, but neither are they wholly asleep. They have had an influence on the dream while it was struggling to find an expression in words and pictures, they have got rid of what was most objectionable, they have altered other parts of it till they are unrecognizable, they have severed real connections while introducing false ones, until the honest but brutal wishful phantasy which lay behind the dream has turned into the manifest dream as we remember it - more or less confused and almost always strange and incomprehensible. Thus the dream (or the distortion which characterizes it) is the expression of a compromise, the evidence of a conflict between the mutually incompatible impulses and strivings of our mental life. And do not let us forget that the same process, the same interplay of forces, which explains the dreams of a normal sleeper, gives us the key to understanding all the phenomena of neurosis and psychosis.

I must apologize if I have hitherto talked so much about myself and my work on the problems of the dream; but it was a necessary preliminary to what follows. My explanation of dream-distortion seemed to me new: I had nowhere found anything like it. Years later (I can no longer remember when) I came across Josef Popper-Lynkeus's book *Phantasien eines Realisten*. One of the stories contained in it bore the title of 'Träumen wie Wachen', and it could not fail to arouse my deepest interest. There was a description in it of a man who could boast that he had never dreamt anything nonsensical. His dreams might be fantastic, like fairy tales, but they were not enough out of harmony with the waking world for it to be possible to say definitely that 'they were impossible or absurd in themselves'. Translated into my manner of speech this meant that in the case of this man no dream-distortion occurred; and the reason produced for its absence put one at the same time in possession of the reason for its occurrence. Popper allowed the man complete insight into the reasons for his peculiarity. He made him say: 'Order and harmony reign both in my thoughts and in my feelings, nor do the two struggle with each other.... I am one and undivided. Other people are divided and their two parts - waking and dreaming - are almost perpetually at war with each other.' And again, on the question of the interpretation of dreams: 'That is certainly no easy task; but with a little attention on the part of the dreamer himself it should no doubt always succeed. - You ask why it is that for the most part it does *not* succeed? In you other people there seems always to be something that lies concealed in your dreams, something unchaste in a special and higher sense, a certain secret quality in your being which it is hard to follow. And that is why your dreams so often seem to be without meaning or even to be nonsense. But in the deepest sense this is not in the least so; indeed, it cannot be so at all - for it is always the same man, whether he is awake or dreaming.'

Now, if we leave psychological terminology out of account, this was the very same explanation of dream-distortion that I had arrived at from my study of dreams. Distortion was a compromise, something in its very nature disingenuous, the product of a conflict between thought and feeling, or, as I had put it, between what is conscious and what is repressed. Where a conflict of this kind was not present and repression was unnecessary, dreams could not be strange or senseless. The man who dreamed in a way no different from that in which he thought while awake was granted by Popper the very condition of internal harmony which, as a social reformer, he aimed at producing in the body politic. And if Science informs us that such a man, wholly without evil and falseness and devoid of all repressions, does not exist and could not survive, yet we may guess that, so far as an approximation to this ideal is possible, it had found its realization in the person of Popper himself.

Overwhelmed by meeting with such wisdom, I began to read all his works - his books on Voltaire, on Religion, on War, on the Universal Provision of Subsistence, etc. - till there was built up clearly before my eyes a picture of this simple-minded, great man, who was a thinker and a critic and at the same time a kindly humanitarian and reformer. I reflected much over the rights of the individual which he advocated and to which I should gladly have added my support had I not been restrained by the thought that neither the processes of Nature nor the aims of human society quite justified such claims. A special feeling of sympathy drew me to him, since he too had clearly had painful experience of the bitterness of the life of a Jew and of the hollowness of the ideals of present-day civilization. Yet I never saw him in the flesh. He knew of me through common acquaintances, and I once had occasion to answer a letter from him in which he asked for some piece of information. But I never sought him out. My innovations in psychology had estranged me from my contemporaries, and especially from the older among them: often enough when I approached some man whom I had honoured from a distance, I found myself repelled, as it were, by his lack of understanding for what had become my whole life to me. And after all Josef Popper had been a physicist: he had been a friend of Ernst Mach. I was anxious that the happy impression of our agreement upon the problem of dream-distortion should not be spoilt. So it came about that I put off calling upon him till it was too late and I could now only salute his bust in the gardens in front of our Rathaus.

SÁNDOR FERENCZI
(1933)

Intentionally left blank

SÁNDOR FERENCZI

We have learnt by experience that wishing costs little; so we generously present one another with the best and warmest of wishes. And of these the foremost is for a long life. A well known Eastern tale reveals the double-sidedness of precisely this wish. The Sultan had his horoscope cast by two wise men. 'Thy lot is happy, master!' said one of them. 'It is written in the stars that thou shalt see all thy kinsmen die before thee.' This prophet was executed. 'Thy lot is happy!' said the other too, 'for I read in the stars that thou shalt outlive all thy kinsmen.' This one was richly rewarded. Both had given expression to the fulfilment of the same wish.

It fell to me in January, 1926, to write an obituary of our unforgettable friend, Karl Abraham. A few years earlier, in 1923, I could congratulate Sándor Ferenczi on the completion of his fiftieth year. To-day, scarcely a decade later, it grieves me that I have outlived him too. In what I wrote for his birthday I was able to celebrate openly his versatility and originality and the richness of his gifts; but the discretion imposed on a friend forbade my speaking of his lovable and affectionate personality, with its readiness to welcome everything of significance.

Since the days when he was led to me by his interest in psycho-analysis, still in its youth, we have shared many things with each other. I invited him to go with me to Worcester, Massachusetts, when in 1909 I was called upon to lecture there during a week of celebrations. In the morning, before the time had come for my lecture to begin, we would walk together in front of the University building and I would ask him to suggest what I should talk about that day. He thereupon gave me a sketch of what, half an hour later, I improvised in my lecture. In this way he had a share in the origin of the *Five Lectures*. Soon after this, at the Nuremberg Congress of 1910, I arranged that he should propose the organization of analysts into an international association - a scheme which we had thought out together. With slight modifications it was accepted and is in force to this day. For many successive years we spent the autumn holidays together in Italy, and a number of papers that appeared later in the literature under his or my name took their first shape in our talks there. When the outbreak of the World War put an end to our freedom of movement, and paralysed our analytic activity as well, he made use of the interval to begin his analysis with me. This met with a break when he was called up for military service, but he was able to resume it later. The feeling of a secure common bond, which grew up between us from so many shared experiences, was not interrupted when, late in life unfortunately, he was united to the outstanding woman who mourns him to-day as his widow.

Ten years ago, when the *Internationale Zeitschrift* dedicated a special number to Ferenczi on his fiftieth birthday, he had already published most of the works which have made all analysts into his pupils. But he was holding back his most brilliant and most fertile achievement. I knew of it, and in the closing sentence of my contribution I urged him to give it to us. Then, in 1924, his *Versuch einer Genitaltheorie* appeared. This little book is a biological rather than a psycho-analytic study; it is an application of the attitudes and insights associated with psycho-analysis to the biology of the sexual processes and, beyond them, to organic life in general. It was perhaps the boldest application of psycho-analysis that was ever attempted. As its governing thought it lays stress on the conservative nature of the instincts, which seek to re-establish every state of things that has been abandoned owing to an external interference. Symbols are recognized as evidence of ancient connections. Impressive instances are adduced to show how the characteristics of what is psychical preserve traces of primaeval changes in the bodily substance. When one has read this work, one seems to understand many peculiarities of sexual life of which one had never previously been able to obtain a comprehensive view, and one finds oneself the richer for hints that promise a deep insight into wide fields of biology. It is a vain task to attempt already to-day to distinguish what can be accepted as an authentic discovery from what seeks, in the fashion of a scientific phantasy, to guess at future knowledge. We lay the little book aside with a feeling: 'This is almost too much to take in at a first reading; I will read it again after a while.' But it is not only I who feel like this. It is probable that some time in the future there will really be a 'bio-analysis', as Ferenczi has prophesied, and it will have to cast back to the *Versuch einer Genitaltheorie*.

After this summit of achievement, it came about that our friend slowly drifted away from us. On his return from a period of work in America he seemed to withdraw more and more into solitary work, though he had previously taken the liveliest share in all that happened in analytic circles. We learnt that one single problem had monopolized his interest. The need to cure and to help had become paramount in him. He had probably set himself aims which, with our therapeutic means, are altogether out of reach to-day. From unexhausted springs of emotion the conviction was borne in upon him that one could effect far more with one's patients if one gave them enough of the love which they had longed for as children. He wanted to discover how this could be carried out within the framework of the psycho-analytic situation; and so long as he had not succeeded in this, he kept apart, no longer certain, perhaps, of agreement with his friends. Wherever it may have been that the road he had started along would have led him, he could not pursue it to the end. Signs were slowly revealed in him of a grave organic destructive process which had probably overshadowed his life for many years already. Shortly before completing his sixtieth year he succumbed to pernicious anaemia. It is impossible to believe that the history of our science will ever forget him.

THE SUBTLETIES OF A FAULTY ACTION
(1935)

Intentionally left blank

THE SUBTLETIES OF A FAULTY ACTION

I was preparing a birthday present for a woman friend - a small engraved gem for insertion into a ring. It was fixed in the centre of a piece of stout cardboard and on this I wrote the following words: 'Voucher for the supply by Messrs. L., jewellers, of a gold ring . . . for the attached stone bearing an engraved ship with sail and oars.' But at the point at which I have here left a gap, between 'ring' and 'for' there stood a word which I was obliged to cross out since it was entirely irrelevant. It was the little word '*bis*'. Why should I have written it at all?

When I read the short inscription through, I was struck by the fact that it contained the word '*für*' twice in rapid succession: '*for* the supply' - '*for* the attached stone'. That sounded ugly and should be avoided. It then occurred to me that '*bis*' had been substituted for '*für*' in an attempt to escape this stylistic awkwardness. No doubt that was so; but it was an attempt that made use of remarkably inadequate means. The preposition '*bis*' was quite out of place in this context and could not possibly be substituted for the necessary '*für*'. So why precisely '*bis*'?

But perhaps the word '*bis*' was not the preposition determining a time-limit. It may have been something totally different - the Latin '*bis*' - 'for a second time', which has retained its meaning in French. '*Ne bis in idem*' is a maxim of Roman law. '*Bis! bis!*' cries a Frenchman if he wants a performance repeated. So that must be the explanation of my senseless slip of the pen. I was being warned against the second '*für*', against a repetition of the same word. Something else must be put instead of it. The chance identity in sound between the foreign word '*bis*' which embodied the criticism of the original phraseology and the German preposition made it possible to insert '*bis*' instead of '*für*' as though by a slip of the pen. But this mistake gained its purpose not by being *made*, but only after it had been *corrected*. I had to cross out the '*bis*' and in so doing I had myself, so to speak, done away with the repetition which was disturbing me. A variant, not without interest, of the mechanism of a parapraxis!

I felt very much pleased with this solution. But in self-analysis the danger of incompleteness is particularly great. One is too soon satisfied with a part explanation, behind which resistance may easily be keeping back something that is more important perhaps. I related this little analysis to my daughter, and she immediately saw how it went on:

‘But you gave her a stone like that for a ring once before. *That’s* probably the repetition you want to avoid. One doesn’t like always to be making the same present.’ I was convinced by this; the objection was obviously to a repetition of the same *present*, not of the same *word*. There had been a displacement on to something trivial with the object of diverting attention from something more important: an aesthetic difficulty, perhaps, in place of an instinctual conflict.

For it was easy to discover the further sequel. I was looking for a motive for not making a present of the stone, and that motive was provided by the reflection that I had already made the same (or a very similar) present. Why should this objection have been concealed and disguised? Very soon I saw clearly why. I wanted not to give the stone away at all. I liked it very much myself.

The explanation of this parapraxis was found without raising any great difficulties. Indeed, a consoling thought soon occurred to me: regrets of this kind only enhance the value of a gift. What sort of gift would it be if one were not a little bit sorry to part with it? Nevertheless the episode enables one to realize once more how complicated the most unobtrusive and apparently simplest mental processes may be. I made a slip in writing out some instructions - put in a ‘*bis*’ where a ‘*für*’ was needed - I noticed it and corrected it: a small mistake, or rather attempt at a mistake, and yet based upon this large number of premisses and dynamic determinants! Indeed, the mistake could not have occurred if the material had not been particularly favourable.

A DISTURBANCE OF MEMORY ON THE ACROPOLIS
(1936)

Intentionally left blank

A DISTURBANCE OF MEMORY ON THE ACROPOLIS

AN OPEN LETTER TO ROMAIN ROLLAND ON THE OCCASION OF HIS SEVENTIETH BIRTHDAY

My dear Friend,

I have been urgently pressed to make some written contribution to the celebration of your seventieth birthday and I have made long efforts to find something that might in any way be worthy of you and might give expression to my admiration for your love of the truth, for your courage in your beliefs and for your affection and good will towards humanity; or, again, something that might bear witness to my gratitude to you as a writer who has afforded me so many moments of exaltation and pleasure. But it was in vain. I am ten years older than you and my powers of production are at an end. All that I can find to offer you is the gift of an impoverished creature, who has 'seen better days'.

You know that the aim of my scientific work was to throw light upon unusual, abnormal or pathological manifestations of the mind - that is to say, to trace them back to the psychical forces operating behind them and to indicate the mechanisms at work. I began by attempting this upon myself and then went on to apply it to other people and finally, by a bold extension, to the human race as a whole. During the last few years, a phenomenon of this sort, which I myself had experienced a generation ago, in 1904, and which I had never understood, has kept on recurring to my mind. I did not at first see why; but at last I determined to analyse the incident - and I now present you with the results of that enquiry. In the process, I shall have, of course, to ask you to give more attention to some events in my private life than they would otherwise deserve.

Every year, at that time, towards the end of August or the beginning of September, I used to set out with my younger brother on a holiday trip, which would last for some weeks and would take us to Rome or to some other region of Italy or to some part of the Mediterranean sea-board. My brother is ten years younger than I am, so he is the same age as you - a coincidence which has only now occurred to me. In that particular year my brother told me that his business affairs would not allow him to be away for long: a week would be the most that he could manage and we should have to shorten our trip. So we decided to travel by way of Trieste to the island of Corfu and there spend the few days of our holiday. At Trieste he called upon a business acquaintance who lived there, and I went with him. Our host enquired in a friendly way about our plans and, hearing that it was our intention to go to Corfu, advised us strongly against it: 'What makes you think of going there at this time of year? It would be too hot for you to do anything. You had far better go to Athens instead. The Lloyd boat sails this afternoon; it will give you three days there to see the town and will pick you up on its return voyage. That would be more agreeable and more worth while.'

As we walked away from this visit, we were both in remarkably depressed spirits. We discussed the plan that had been proposed, agreed that it was quite impracticable and saw nothing but difficulties in the way of carrying it out; we assumed, moreover, that we should not be allowed to land in Greece without passports. We spent the hours that elapsed before the Lloyd offices opened in wandering about the town in a discontented and irresolute frame of mind. But when the time came, we went up to the counter and booked our passages for Athens as though it were a matter of course, without bothering in the least about the supposed difficulties and indeed without having discussed with one another the reasons for our decision. Such behaviour, it must be confessed, was most strange. Later on we recognized that we had accepted the suggestion that we should go to Athens instead of Corfu instantly and most readily. But, if so, why had we spent the interval before the offices opened in such a gloomy state and foreseen nothing but obstacles and difficulties?

When, finally, on the afternoon after our arrival, I stood on the Acropolis and cast my eyes around upon the landscape, a surprising thought suddenly entered my mind: 'So all this really *does* exist, just as we learnt at school!' To describe the situation more accurately, the person who gave expression to the remark was divided, far more sharply than was usually noticeable, from another person who took cognizance of the remark; and both were astonished, though not by the same thing. The first behaved as though he were obliged, under the impact of an unequivocal observation, to believe in something the reality of which had hitherto seemed doubtful. If I may make a slight exaggeration, it was as if someone, walking beside Loch Ness, suddenly caught sight of the form of the famous Monster stranded upon the shore and found himself driven to the admission: 'So it really *does* exist - the sea-serpent we've never believed in!' The second person, on the other hand, was justifiably astonished, because he had been unaware that the real existence of Athens, the Acropolis, and the landscape around it had ever been objects of doubt. What he had been expecting was rather some expression of delight or admiration.

Now it would be easy to argue that this strange thought that occurred to me on the Acropolis only serves to emphasize the fact that seeing something with one's own eyes is after all quite a different thing from hearing or reading about it. But it would remain a very strange way of clothing an uninteresting commonplace. Or it would be possible to maintain that it was true that when I was a schoolboy I had *thought* I was convinced of the historical reality of the city of Athens and its history, but that the occurrence of this idea on the Acropolis had precisely shown that in my unconscious I had *not* believed in it, and that I was only now acquiring a conviction that 'reached down to the unconscious'. An explanation of this sort sounds very profound, but it is easier to assert than to prove; moreover, it is very much open to attack upon theoretical grounds. No. I believe that the two phenomena, the depression at Trieste and the idea on the Acropolis, were intimately connected. And the first of these is more easily intelligible and may help us towards an explanation of the second.

The experience at Trieste was, it will be noticed, also no more than an expression of incredulity: 'We're going to see Athens? Out of the question! - it will be far too difficult!' The accompanying depression corresponded to a regret that it was out of the question: it would have been so lovely. And now we know where we are. It is one of those cases of 'too good to be true' that we come across so often. It is an example of the incredulity that arises so often when we are surprised by a piece of good news, when we hear we have won a prize, for instance, or drawn a winner, or when a girl learns that the man whom she has secretly loved has asked her parents for leave to pay his addresses to her.

When we have established the existence of a phenomenon, the next question is of course as to its cause. Incredulity of this kind is obviously an attempt to repudiate a piece of reality; but there is something strange about it. We should not be in the least astonished if an attempt of this kind were aimed at a piece of reality that threatened to bring unpleasure: the mechanism of our mind is, so to speak, planned to work along just such lines. But why should such incredulity arise in something which, on the contrary, promises to bring a high degree of pleasure? Truly paradoxical behaviour! But I recollect that on a previous occasion I dealt with the similar case of the people who, as I put it, are 'wrecked by success'. As a rule people fall ill as a result of frustration, of the non-fulfilment of some vital necessity or desire. But with these people the opposite is the case; they fall ill, or even go entirely to pieces, because an overwhelmingly powerful wish of theirs has been fulfilled. But the contrast between the two situations is not so great as it seems at first. What happens in the paradoxical case is merely that the place of the external frustration is taken by an internal one. The sufferer does not permit himself happiness: the internal frustration commands him to cling to the external one. But why? Because - so runs the answer in a number of cases - one cannot expect Fate to grant one anything so good. In fact, another instance of 'too good to be true', the expression of a pessimism of which a large portion seems to find a home in many of us. In another set of cases, just as in those who are wrecked by success, we find a sense of guilt or inferiority, which can be translated: 'I'm not worthy of such happiness, I don't deserve it.' But these two motives are essentially the same, for one is only a projection of the other. For, as has long been known, the Fate which we expect to treat us so badly is a materialization of our conscience, of the severe super-ego within us, itself a residue of the punitive agency of our childhood.

This, I think, explains our behaviour in Trieste. We could not believe that we were to be given the joy of seeing Athens. The fact that the piece of reality that we were trying to repudiate was to begin with only a *possibility* determined the character of our immediate reactions. But when we were standing on the Acropolis the possibility had become an actuality, and the same disbelief found a different but far clearer expression. In an undistorted form this should have been: 'I could really not have imagined it possible that I should ever be granted the sight of Athens with my own eyes - as is now indubitably the case!' When I recall the passionate desire to travel and see the world by which I was dominated at school and later, and how long it was before that desire began to find its fulfilment, I am not surprised at its after-effect on the Acropolis; I was then forty-eight years old. I did not ask my younger brother whether he felt anything of the same sort. A certain amount of reserve surrounded the whole episode; and it was this which had already interfered with our exchanging thoughts at Trieste.

If I have rightly guessed the meaning of the thought that came to me on the Acropolis and if it did in fact express my joyful astonishment at finding myself at that spot, the further question now arises why this meaning should have been subjected in the thought itself to such a distorted and distorting disguise.

The essential subject-matter of the thought, to be sure, was retained even in the distortion - that is, incredulity: 'By the evidence of my senses I am now standing on the Acropolis, but I cannot believe it.' This incredulity, however, this doubt of a piece of reality, was doubly displaced in its actual expression: first, it was shifted back into the past, and secondly it was transposed from my relation to the Acropolis on to the very existence of the Acropolis. And so something occurred which was equivalent to an assertion that at some time in the past I had doubted the real existence of the Acropolis - which, however, my memory rejected as being incorrect and, indeed, impossible.

The two distortions involve two independent problems. We can attempt to penetrate deeper into the process of transformation. Without for the moment particularizing as to how I have arrived at the idea, I will start from the presumption that the original factor must have been a sense of some feeling of the unbelievable and the unreal in the situation at the moment. The situation included myself, the Acropolis and my perception of it. I could not account for this doubt; I obviously could not attach the doubt to my sensory impressions of the Acropolis. But I remembered that in the past I had had a doubt about something which had to do with this precise locality, and I thus found the means for shifting the doubt into the past. In the process, however, the subject-matter of the doubt was changed. I did not simply recollect that in my early years I had doubted whether I myself would ever see the Acropolis, but I asserted that at that time I had disbelieved in the reality of the Acropolis itself. It is precisely this effect of the displacement that leads me to think that the actual situation on the Acropolis contained an element of doubt of reality. I have certainly not yet succeeded in making the process clear; so I will conclude by saying briefly that the whole psychological situation, which seems so confused and is so difficult to describe, can be satisfactorily cleared up by assuming that at the time I had (or might have had) a momentary feeling: '*What I see here is not real.*' Such a feeling is known as a 'feeling of derealization'. I made an attempt to ward that feeling off, and I succeeded, at the cost of making a false pronouncement about the past.

These derealizations are remarkable phenomena which are still little understood. They are spoken of as 'sensations', but they are obviously complicated processes, attached to particular mental contents and bound up with decisions made about those contents. They arise very frequently in certain mental diseases, but they are not unknown among normal people, just as hallucinations occasionally occur in the healthy. Nevertheless they are certainly failures in functioning and, like dreams, which, in spite of their regular occurrence in healthy people, serve us as models of psychological disorder, they are abnormal structures. These phenomena are to be observed in two forms: the subject feels either that a piece of reality or that a piece of his own self is strange to him. In the latter case we speak of 'depersonalizations'; derealizations and depersonalizations are intimately connected. There is another set of phenomena which may be regarded as their positive counterparts - what are known as '*fausse reconnaissance*', '*déjà vu*', '*déjà raconté*' etc., illusions in which we seek to accept something as belonging to our ego, just as in the derealizations we are anxious to keep something out of us. A naïvely mystical and unpsychological attempt at explaining the phenomena of '*déjà vu*' endeavours to find evidence in it of a former existence of our mental self. Depersonalization leads us on to the extraordinary condition of '*double conscience*', which is more correctly described as 'split personality'. But all of this is so obscure and has been so little mastered scientifically that I must refrain from talking about it any more to you.

It will be enough for my purposes if I return to two general characteristics of the phenomena of derealization. The first is that they all serve the purpose of defence; they aim at keeping something away from the ego, at disavowing it. Now, new elements, which may give occasion for defensive measures, approach the ego from two directions - from the real external world and from the internal world of thoughts and impulses that emerge in the ego. It is possible that this alternative coincides with the choice between derealizations proper and depersonalizations. There are an extraordinarily large number of methods (or mechanisms, as we say) used by our ego in the discharge of its defensive functions. An investigation is at this moment being carried on close at hand which is devoted to the study of these methods of defence: my daughter, the child analyst, is writing a book upon them. The most primitive and thorough-going of these methods, 'repression', was the starting point of the whole of our deeper understanding of psychopathology. Between repression and what may be termed the normal method of fending off what is distressing or unbearable, by means of recognizing it, considering it, making a judgement upon it and taking appropriate action about it, there lie a whole series of more or less clearly pathological methods of behaviour on the part of the ego. May I stop for a moment to remind you of a marginal case of this kind of defence? You remember the famous lament of the Spanish Moors '*Ay de mi Alhama*', which tells how King Boabdil received the news of the fall of his city of Alhama. He feels that this loss means the end of his rule. But he will not 'let it be true', he determines to treat the news as '*non arrivé*'. The verse runs:

'Cartas le fueron venidas
que Alhama era ganada:
las cartas echo en el fuego,
y al mensajero matara.'

It is easy to guess that a further determinant of this behaviour of the king was his need to combat a feeling of powerlessness. By burning the letters and having the messenger killed he was still trying to show his absolute power.

The second general characteristic of the derealizations - their dependence upon the past, upon the ego's store of memories and upon earlier distressing experiences which have since perhaps fallen victim to repression - is not accepted without dispute. But precisely my own experience on the Acropolis, which actually culminated in a disturbance of memory and a falsification of the past, helps us to demonstrate this connection. It is not true that in my schooldays I ever doubted the real existence of Athens. I only doubted whether I should ever see Athens. It seemed to me beyond the realms of possibility that I should travel so far - that I should 'go such a long way'. This was linked up with the limitations and poverty of our conditions of life in my youth. My longing to travel was no doubt also the expression of a wish to escape from that pressure, like the force which drives so many adolescent children to run away from home. I had long seen clearly that a great part of the pleasure of travel lies in the fulfilment of these early wishes - that it is rooted, that is, in dissatisfaction with home and family. When first one catches sight of the sea, crosses the ocean and experiences as realities cities and lands which for so long had been distant, unattainable things of desire - one feels oneself like a hero who has performed deeds of improbable greatness. I might that day on the Acropolis have said to my brother: 'Do you still remember how, when we were young, we used day after day to walk along the same streets on our way to school, and how every Sunday we used to go to the Prater or on some excursion we knew so well? And now, here we are in Athens, and standing on the Acropolis! We really *have* gone a long way!' So too, if I may compare such a small event with a greater one, Napoleon, during his coronation as Emperor in Notre Dame, turned to one of his brothers - it must no doubt have been the eldest one, Joseph - and remarked: 'What would *Monsieur notre Père* have said to this, if he could have been here to-day?'

But here we come upon the solution of the little problem of why it was that already at Trieste we interfered with our enjoyment of the voyage to Athens. It must be that a sense of guilt was attached to the satisfaction in having gone such a long way: there was something about it that was wrong, that from earliest times had been forbidden. It was something to do with a child's criticism of his father, with the undervaluation which took the place of the overvaluation of earlier childhood. It seems as though the essence of success was to have got further than one's father, and as though to excel one's father was still something forbidden.

As an addition to this generally valid motive there was a special factor present in our particular case. The very theme of Athens and the Acropolis in itself contained evidence of the son's superiority. Our father had been in business, he had had no secondary education, and Athens could not have meant much to him. Thus what interfered with our enjoyment of the journey to Athens was a feeling *filial piety*. And now you will no longer wonder that the recollection of this incident on the Acropolis should have troubled me so often since I myself have grown old and stand in need of forbearance and can travel no more.

I am ever sincerely yours,
SIGM. FREUD

January, 1936

LETTER TO GEORG FUCHS
(1931)

After reading your letter I felt a wave of the deepest sympathy, but it was soon halted by two reflections - an internal difficulty and an external obstacle. A sentence from your own preface offers me an apt expression of the former: 'No doubt, however, there are people who have so poor an opinion of the civilized humanity of to-day that they deny the existence of a world conscience.' I believe I am one of those people. For instance, I could not subscribe to the assertion that the treatment of convicted prisoners is a disgrace to our civilization. On the contrary, a voice would tell me, it is in perfect harmony with our civilization, a necessary expression of the brutality and lack of understanding which dominate the civilized humanity of the present time. And if by some miracle people suddenly became convinced that the reform of the penal system is the first and most urgent task before our civilization, what else would emerge than that capitalist society has not now the means for meeting the expenditure which that reform would demand? The second, the external, difficulty is brought to light in the passages in your letter in which you exalt me into a recognized intellectual leader and cultural innovator and attribute to me the privilege of having the ear of the civilized world. I only wish, my dear Sir, that it were so: I should not in that case refuse your request. But it seems to me that I am *persona ingrata*, if not *ingratissima*, with the German people - and moreover with the learned and the unlearned alike. I hope most positively that you will not think that I feel seriously aggrieved by these signs of disapproval. It is tens of years since I have been so foolish; measured by your example, moreover, it would be too ridiculous. I only mention these trivialities to confirm the fact that I am no desirable advocate for a book which seeks to kindle its readers' sympathies on behalf of a good cause. Let me add that your book is a moving one, noble, wise and good.

PREFACE TO RICHARD STERBA'S *DICTIONARY OF PSYCHO-ANALYSIS*
(1936)

July 3, 1932.

Dear Dr. Sterba, Your *Dictionary* gives me the impression of being a valuable aid to learners and of being a fine achievement on its own account. The precision and correctness of the individual entries is in fact of commendable excellence. English and French translations of the headings are not indispensable but would add further to the value of the work. I do not overlook the fact that the path from the letter A to the end of the alphabet is a very long one, and that to follow it would mean an enormous burden of work for you. So do not do it unless you feel an internal obligation - only obey a compulsion of *that* kind and certainly not any external pressure.

Yours sincerely,
Freud.

PREFACE TO MARIE BONAPARTE'S
THE LIFE AND WORKS OF EDGAR ALLAN POE: A PSYCHO-ANALYTIC INTERPRETATION
(1933)

In this volume my friend and pupil, Marie Bonaparte, has directed the light of psycho-analysis upon the life and work of a great writer of a pathological type. Thanks to her interpretative efforts, we can now understand how much of the characteristics of his work were determined by their author's special nature; but we also learn that this was itself the precipitate of powerful emotional ties and painful experiences in his early youth. Investigations of this kind are not intended to explain an author's genius, but they show what motive forces aroused it and what material was offered to him by destiny. There is a particular fascination in studying the laws of the human mind as exemplified in outstanding individuals.

TO THOMAS MANN ON HIS SIXTIETH BIRTHDAY
(1935)

My Dear Thomas Mann, Accept as a friend my affectionate greetings on your sixtieth birthday. I am one of your 'oldest' readers and admirers and I might wish you a very long and happy life as is the custom on such occasions. But I shall not do so. Wishing is cheap and strikes me as a relapse into the days when people believed in the magical omnipotence of thoughts. I think, too, from my most personal experience, that it is well if a compassionate fate sets a timely end to the length of our life.

Nor do I think the practice deserves imitation by which affection on these festive occasions disregards respect, and by which the subject of the celebration is compelled to hear himself loaded with praise as a man and analysed and criticized as an artist. I shall not be guilty of such presumption. I can allow myself something else however. In the name of a countless number of your contemporaries I can express to you our confidence that you will never do or say - for an author's words are deeds - anything that is cowardly or base. Even in times and circumstances that perplex the judgement you will take the right path and point it out to others.

Yours very sincerely,
Freud

June 1935.

MOSES AND MONOTHEISM
THREE ESSAYS
(1939)

Intentionally left blank

I

MOSES AN EGYPTIAN

To deprive a people of the man whom they take pride in as the greatest of their sons is not a thing to be gladly or carelessly undertaken, least of all by someone who is himself one of them. But we cannot allow any such reflection to induce us to put the truth aside in favour of what are supposed to be national interests; and, moreover, the clarification of a set of facts may be expected to bring us a gain in knowledge.

The man Moses, who set the Jewish people free, who gave them their laws and founded their religion, dates from such remote times that we cannot evade a preliminary enquiry as to whether he was a historical personage or a creature of legend. If he lived, it was in the thirteenth, though it may have been in the fourteenth, century before Christ. We have no information about him except from the sacred books of the Jews and their traditions as recorded in writing. Although a decision on the question thus lacks final certainty, an overwhelming majority of historians have nevertheless pronounced in favour of the view that Moses was a real person and that the Exodus from Egypt associated with him did in fact take place. It is justly argued that the later history of the people of Israel would be incomprehensible if this premiss were not accepted. Indeed, science to-day has become altogether more circumspect and handles traditions far more indulgently than in the early days of historical criticism.

The first thing that attracts our attention about the figure of Moses is his name, which is 'Mosheh' in Hebrew. 'What is its origin?' we may ask, 'and what does it mean?' As we know, the account in the second chapter of *Exodus* already provides an answer. We are told there that the Egyptian princess who rescued the infant boy from exposure in the Nile gave him that name, putting forward an etymological reason: 'because I drew him out of the water'. This explanation, however, is clearly inadequate. 'The Biblical interpretation of the name as "he who was drawn out of the water"', argues a writer in the *Jüdisches Lexicon*,¹ 'is popular etymology, with which, to begin with, it is impossible to harmonize the *active* form of the Hebrew word - for "*Mosheh*" can at most only mean "he who draws out".' We can support this rejection by two further arguments: in the first place, it is absurd to attribute to an Egyptian princess a derivation of the name from the Hebrew, and secondly, the water out of which the child was drawn was most probably not the water of the Nile.

¹ Herlitz and Kirschner (1930), 4 (1), 303.

On the other hand, a suspicion has long been expressed, and in many different quarters, that the name 'Moses' is derived from the Egyptian vocabulary. Instead of enumerating all the authorities who have argued in this sense, I will quote the relevant passage from a comparatively recent book, *The Dawn of Conscience* (1934), by J. H. Breasted, a writer whose *History of Egypt* (1906) is regarded as a standard work: 'It is important to notice that his name, Moses, was Egyptian. It is simply the Egyptian word "mose" meaning "child", and is an abridgement of a fuller form of such names as "Amen-mose" meaning "Amon-a-child" or "Ptah-mose" meaning "Ptah-a-child", these forms themselves being likewise abbreviations for the complete form "Amon-(has-given)-a-child" or "Ptah-(has given)-a-child". The abbreviation "child" early became a convenient rapid form for the cumbrous full name, and the name Mose, "child", is not uncommon on the Egyptian monuments. The father of Moses without doubt prefixed to his son's name that of an Egyptian god like Amon or Ptah, and this divine name was gradually lost in current usage, till the boy was called "Mose". (The final s is an addition drawn from the Greek translation of the Old Testament. It is not in the Hebrew which has "Mosheh").'¹ I have repeated this passage word for word and I am by no means ready to share responsibility for its details. I am also rather surprised that Breasted has failed to mention precisely the analogous theophorous names which figure in the list of Egyptian kings, such as Ahmose, Thoth-mose and Ra-mose.

¹ Breasted, 1934, 350.

Now we should have expected that one of the many people who have recognized that 'Moses' is an Egyptian name would also have drawn the conclusion or would at least have considered the possibility that the person who bore this Egyptian name may himself have been an Egyptian. In relation to modern times we have no hesitation in drawing such conclusions, though nowadays people bear not one name but two - a family name and a personal name - and though a change of name or the adoption of a similar one in fresh circumstances is not beyond possibility. Thus we are not in the least surprised to find it confirmed that the poet Chamisso was French by birth, that Napoleon Buonaparte, on the other hand, was of Italian extraction and that Benjamin Disraeli was indeed an Italian Jew, as we should expect from his name. In relation to ancient and primitive times, one would have thought that a conclusion such as this as to a person's nationality based on his name would have seemed far more reliable and in fact unimpeachable. Nevertheless, so far as I know, no historian has drawn this conclusion in the case of Moses - not even any of those who, once again like Breasted himself (1934, 354), are ready to assume that 'Moses was learned in all the wisdom of the Egyptians'.¹

What prevented their doing so cannot be judged with certainty. Possibly their reverence for Biblical tradition was invincible. Possibly the notion that the man Moses might have been anything but a Hebrew seemed too monstrous. However that may be, it emerges that the recognition that the name of Moses is Egyptian has not been looked upon as affording decisive evidence of his origin, and that no further conclusions have been drawn from it. If the question of this great man's nationality is regarded as important, it would seem to be desirable to bring forward fresh material that would help towards answering it.

¹ Although the suspicion that Moses was an Egyptian has been voiced often enough without reference to his name, from the earliest times up to the present.

That is what my short paper aims at doing. Its claim to be given a place in the pages of *Imago* rests on the fact that the substance of what it has to contribute is an application of psycho-analysis. The argument arrived at in this way will undoubtedly only impress that minority of readers who are familiar with analytic thinking and who are able to appreciate its findings. To them, however, it will, I hope, appear significant.

In 1909 Otto Rank, who was at that time still under my influence, published, following a suggestion of mine, a book bearing the title *Der Mythos von der Geburt des Helden*.¹ It deals with the fact that 'almost all the prominent civilized nations... began at an early stage to glorify their heroes, legendary kings and princes, founders of religions, dynasties, empires or cities, in brief their national heroes, in a number of poetic tales and legends. The history of the birth and of the early life of these personalities came to be especially invested with phantastic features, which, indifferent peoples, even though widely separated by space and entirely independent of each other, present a baffling similarity and in part, indeed, a literal conformity. Many investigators have been impressed with this fact, which has long been recognized.' If, following Rank, we construct (by a technique a little like Galton's) an 'average legend' that brings into prominence the essential features of all these stories, we arrive at the following picture:

'The hero is the child of the *most aristocratic* parents; usually the son of a king.

'His conception is preceded by difficulties, such as abstinence or prolonged barrenness or his parents having to have intercourse in secret owing to external prohibitions or obstacles. During the pregnancy, or even earlier, there is a prophecy (in the form of a dream or oracle) cautioning against his birth, usually threatening danger to his father.

¹ It is far from being my intention to belittle the value of Rank's independent contributions to the work.

'As a result of this the new-born child is condemned to death or to *exposure*, usually by the orders of *his father or of someone representing him*; as a rule he is given over to the *water* in a *casket*.

'He is afterwards rescued by animals or by *humble people* (such as shepherds) and is suckled by a *female animal* or by a *humble woman*.

'After he has grown up, he rediscovers his aristocratic parents after highly variegated experiences, *takes his revenge on his father*, on the one hand, and is *acknowledged* on the other and achieves greatness and fame.'

The oldest of the historical figures to whom this myth of birth is attached is Sargon of Agade, the founder of Babylon (c. 2800 B.C.). For us in particular it will not be without interest to quote the account of it, which is attributed to him himself:

'Sargon, the mighty King, the King of Agade am I. *My mother was a Vestal, my father I knew not*, while my father's brother dwelt in the mountains. In my city, Azupirani, which lies on the bank of the Euphrates, my mother, the Vestal, conceived me. *Secretly she bore me. She laid me in a coffer made of reeds*, closed my doorway with pitch, and *let me down into the river*, which did not drown me. The river carried me to Akki, the drawer of water. Akki, the drawer of water, lifted me out in the kindness of his heart. *Akki, the drawer of water, brought me up as his own son*. Akki, the drawer of water, made me his gardener, While I worked as a gardener, Ishtar grew fond of me, I became King and for forty-five years I held kingly sway.'

The names most familiar to us in the series which begins with Sargon of Agade are Moses, Cyrus and Romulus. But in addition to these Rank has brought together a whole number of other heroic figures from poetry or legend, of whom the same story of their youth is told, either in its entirety or in easily recognizable fragments - including Oedipus, Karna, Paris, Telephos, Perseus, Heracles, Gilgamesh, Amphion and Zethos, and others.

Rank's researches have made us acquainted with the source and purpose of this myth. I need only refer to them with some brief indications. A hero is someone who has had the courage to rebel against his father and has in the end victoriously overcome him. Our myth traces this struggle back as far as the individual's prehistory, for it represents him as being born against his father's will and rescued despite his father's evil intention. The exposure in a casket is an unmistakable symbolic representation of birth: the casket is the womb and the water is the amniotic fluid. The parent-child relationship is represented in countless dreams by pulling out of the water or rescuing from the water. When a people's imagination attaches the myth of birth which we are discussing to an outstanding figure, it is intending in that way to recognize him as a hero and to announce that he has fulfilled the regular pattern of a hero's life. In fact, however, the source of the whole poetic fiction is what is known as a child's 'family romance', in which the son reacts to a change in his emotional relation to his parents and in particular to his father. A child's earliest years are dominated by an enormous overvaluation of his father; in accordance with this a king and queen in dreams and fairy tales invariably stand for parents. Later, under the influence of rivalry and of disappointment in real life, the child begins to detach himself from his parents and to adopt a critical attitude towards his father. Thus the two families in the myth - the aristocratic one and the humble one - are both of them reflections of the child's own family as they appeared to him in successive periods of his life.

We may fairly say that these explanations make the widespread and uniform nature of myths of the birth of heroes fully intelligible. For that reason it is all the more deserving of interest that the legend of the birth and exposure of Moses occupies a special position and, indeed, in one essential respect contradicts the rest.

Let us start from the two families between which, according to the legend, the child's destiny is played out. According to the analytic interpretation, as we know, the families are one and the same and are only differentiated chronologically. In the typical form of the legend, it is the first family, the one into which the child is born, which is the aristocratic one, most often of royal rank; the second family, the one in which the child grows up: is the one that is humble or has fallen on evil days. This tallies, moreover, with the circumstances to which the interpretation traces the legend back. Only in the legend of Oedipus is this difference blurred: the child which has been exposed by one royal family is received by another royal couple. It can scarcely be by chance, one feels, that precisely in this example the original identity of the two families may be dimly perceived in the legend itself. The social contrast between the two families provides the myth - which, as we know, is designed to stress the heroic nature of a great man with a second function which becomes of special significance when applied to historical personages. For the myth can also be employed to create a patent of nobility for the hero, to raise his social standing. To the Medes, Cyrus was a foreign conqueror; but by means of a legend of exposure he became the grandson of their king. The same applies to Romulus. If any such person existed, he must have been an adventurer of unknown origin, an upstart; the legend, however, made him offspring and heir of the royal house of Alba Longa.

With Moses things were quite different. In his case the first family, elsewhere the aristocratic one, was sufficiently modest. He was the child of Jewish Levites. But the place of the second family, elsewhere the humble one, was taken by the royal house of Egypt; the princess brought him up as her own son. This deviation from type has puzzled many people. Eduard Meyer, and others following him, assumed that originally the legend was different. Pharaoh, according to them, had been warned by a prophetic dream¹ that a son born to his daughter would bring danger to him and his kingdom. He therefore had the child exposed in the Nile after his birth. But he was rescued by Jewish people and brought up as their child. For 'nationalist motives' (as Rank puts it²) the legend would then have been given the modified form in which we know it.

¹ This is also mentioned in the account given by Flavius Josephus.

² Rank, 1909, 80 *n*.

A moment's reflection, however, tells us that an original legend of Moses like this, one no longer deviating from the other legends, cannot have existed. For it was either of Egyptian or of Jewish origin. The first alternative is ruled out: the Egyptians had no motive for glorifying Moses, since he was no hero to them. We are to suppose, then, that the legend was created among the Jewish people - that is to say, that it was attached in its familiar form to the figure of their leader. But it was totally unsuitable for that purpose, for what would be the use to a people of a legend which made their great man into a foreigner?

The legend of Moses, in the form in which we have it to-day, falls notably short of its secret intention. If Moses was not of royal birth, the legend could not stamp him as a hero; if it left him as a Jewish child, it had done nothing to raise his social standing. Only one small fragment of the entire myth remains effective: the assurance that the child had survived in the face of powerful external forces. (This feature recurs in the story of the childhood of Jesus, in which King Herod takes over the role of Pharaoh.) Thus we are in fact free to suppose that some later and clumsy adapter of the material of the legend found an opportunity for introducing into the story of his hero Moses something which resembled the classical exposure legends marking out a hero, but which, on account of the special circumstances of the case, was not applicable to Moses,

Our investigations might have had to rest content with this inconclusive and, moreover, uncertain outcome, and they might have done nothing towards answering the question of whether Moses was an Egyptian. There is, however, another and perhaps more hopeful line of approach to an assessment of the legend of exposure.

Let us return to the two families of the myth. At the level of analytic interpretation they are, as we know, identical; whereas at the level of the myth they are differentiated into an aristocratic family and a humble one. Where, however, the figure to whom the myth is attached is a historical one, there is a third level - that of reality. One of the families is the real one, in which the person in question (the great man) was actually born and grew up; the other is fictitious, fabricated by the myth in pursuit of its own intentions. As a rule the humble family is the real one and the aristocratic family the fabricated one. The situation in the case of Moses seemed somehow different. And here the new line of approach will perhaps lead to a clarification: in every instance which it has been possible to test, the first family, the one from which the child was exposed, was the invented one, and the second one, in which he was received and grew up, was the real one. If we have the courage to recognize this assertion as universally true and as applying also to the legend of Moses, then all at once we see things clearly: Moses was an Egyptian - probably an aristocrat - whom the legend was designed to turn into a Jew. And that would be our conclusion. The exposure in the water was at its correct point in the story; but, in order to fit in with the fresh purpose, its aim had to be somewhat violently twisted. From being a way of sacrificing the child, it was turned into a means of rescuing him.

The deviation of the legend of Moses from all the others of its kind can be traced back to a special feature of his history. Whereas normally a hero, in the course of his life, rises above his humble beginnings, the heroic life of the man Moses began with his stepping down from his exalted position and descending to the level of the Children of Israel.

We started on this brief enquiry in the expectation of deriving a fresh argument from it in support of the suspicion that Moses was an Egyptian. We have seen that the first argument, based on his name, failed with many people to carry conviction.¹ We must be prepared to find that this new argument, based on an analysis of the legend of exposure, may have no better success. It will no doubt be objected that the circumstances of the construction and transformation of legends are, after all, too obscure to justify a conclusion such as ours and that the traditions surrounding the heroic figure of Moses - with all their confusion and contradictions and their unmistakable signs of centuries of continuous and tendentious revisions and superimpositions - are bound to baffle every effort to bring to light the kernel of historical truth that lies behind them. I do not myself share this dissenting attitude but neither am I in a position to refute it.

¹ Thus Eduard Meyer writes (1905, 651): 'The name "Moses" is probably Egyptian, and the name "Pinchas" in the priestly family of Shiloh . . . is undoubtedly Egyptian. Of course this does not prove that these families were of Egyptian origin, but, no doubt, that they had connections with Egypt.' We may ask, to be sure, what sort of connections this is supposed to make us think of.

If no more certainty could be reached than this, why, it may be asked, have I brought this enquiry into public notice at all? I am sorry to say that even my justification for doing so cannot go beyond hints. For if one allows oneself to be carried away by the two arguments which I have put forward here, and if one sets out to take the hypothesis seriously that Moses was an aristocratic Egyptian, very interesting and far-reaching prospects are opened up. With the help of some not very remote assumptions, we shall, I believe, be able to understand the motives which led Moses in the unusual step he took and, closely related to this, to obtain a grasp of the possible basis of a number of the characteristics and peculiarities of the laws and religion which he gave to the Jewish people; and we shall even be led on to important considerations regarding the origin of monotheist religions in general. Such weighty conclusions cannot, however, be founded on psychological probabilities alone. Even if one accepts the fact of Moses being an Egyptian as a first historical foothold, one would need to have at least a second firm fact in order to defend the wealth of emerging possibilities against the criticism of their being a product of the imagination and too remote from reality. Objective evidence of the period to which the life of Moses and with it the Exodus from Egypt are to be referred would perhaps have fulfilled this requirement. But this has not been obtainable, and it will therefore be better to leave unmentioned any further implications of the discovery that Moses was an Egyptian.

II

IF MOSES WAS AN EGYPTIAN . . .

In an earlier contribution to this periodical,¹ I attempted to bring up a fresh argument in support of the hypothesis that the man Moses, the liberator and law-giver of the Jewish people, was not a Jew but an Egyptian. It had long been observed that his name was derived from the Egyptian vocabulary, though the fact had not been properly appreciated. What I added was that the interpretation of the myth of exposure which was linked with Moses necessarily led to the inference that he was an Egyptian whom the needs of a people sought to make into a Jew. I remarked at the end of my paper that important and far-reaching implications followed from the hypothesis that Moses was an Egyptian, but that I was not prepared to argue publicly in favour of these implications, since they were based only on psychological probabilities and lacked any objective proof. The greater the importance of the views arrived at in this way, the more strongly one feels the need to beware of exposing them without a secure basis to the critical assaults of the world around one - like a bronze statue with feet of clay. Not even the most tempting probability is a protection against error; even if all the parts of a problem seem to fit together like the pieces of a jig-saw puzzle, one must reflect that what is probable is not necessarily the truth and that the truth is not always probable. And lastly, it did not seem attractive to find oneself classed with the schoolmen and Talmudists who delight in exhibiting their ingenuity without regard to how remote from reality their thesis may be.

Notwithstanding these hesitations, which weigh as much with me to-day as they did before, the outcome of my conflicting motives is a decision to produce the present sequel to my earlier communication. But once again this is not the whole story nor the most important part of the whole story.

¹ *Imago*, 23 (1937).

(1)

If, then, Moses was an Egyptian - our first yield from this hypothesis is a fresh enigma and one which it is hard to solve. If a people or a tribe¹ sets out upon a great undertaking, it is only to be expected that one of its members will take his place as their leader or will be chosen for that post. But it is not easy to guess what could induce an aristocratic Egyptian - a prince, perhaps, or a priest or high official - to put himself at the head of a crowd of immigrant foreigners at a backward level of civilization and to leave his country with them. The well known contempt felt by the Egyptians for foreign nationals makes such a proceeding particularly unlikely. Indeed I could well believe that this has been precisely why even those historians who have recognized that the man's name was Egyptian, and who have ascribed to him all the wisdom of the Egyptians, have been unwilling to accept the obvious possibility that Moses was an Egyptian.

This first difficulty is promptly followed by another. We must not forget that Moses was not only the political leader of the Jews settled in Egypt but was also their law-giver and educator and forced them into the service of a new religion, which to this very day is known after him as the Mosaic one. But is it so easy for one single man to create a new religion? And if anyone wishes to influence another person's religion, would he not most naturally convert him to his own? The Jewish people in Egypt were certainly not without a religion of some form or other; and if Moses, who gave them a new one, was an Egyptian, the presumption cannot be put aside that this other new religion was the Egyptian one.

There is something that stands in the way of this possibility: the fact of there being the most violent contrast between the Jewish religion which is attributed to Moses and the religion of Egypt. The former is a rigid monotheism on the grand scale: there is only one God, he is the sole God, omnipotent, unapproachable; his aspect is more than human eyes can tolerate, no image must be made of him, even his name may not be spoken. In the Egyptian religion there is an almost innumerable host of deities of varying dignity and origin: a few personifications of great natural forces such as heaven and earth, sun and moon, an occasional abstraction such as Ma'at (truth or justice) or a caricature such as the dwarf-like Bes; but most of them local gods, dating from the period when the country was divided into numerous provinces, with the shape of animals, as though they had not yet completed their evolution from the old totem animals, with no sharp distinctions between them, and scarcely differing in the functions allotted to them. The hymns in honour of these gods say almost the same things about all of them, and identify them with one another unhesitatingly, in a manner hopelessly confusing to us. The names of gods are combined with one another, so that one of them may almost be reduced to being an epithet of the other. Thus, in the heyday of the 'New Kingdom' the principal god of the city of Thebes was called Amen-Re'; the first part of this compound stands for the ram-headed god of the city, while Re' is the name of the falcon-headed sun-god of On. Magical and ceremonial acts, charms and amulets dominated the service of these gods as they did the daily life of the Egyptians.

¹ We have no notion of what numbers were concerned in the Exodus from Egypt.

Some of these differences may easily be derived from the fundamental contrast between a strict monotheism and an unrestricted polytheism. Others are evidently the result of a difference in spiritual and intellectual level, since one of these religions is very close to primitive phases, while the other has risen to the heights of sublime abstraction. It may be due to these two factors that one occasionally has an impression that the contrast between the Mosaic and the Egyptian religions is a deliberate one and has been intentionally heightened - when, for instance, one of them condemns magic and sorcery in the severest terms, while in the other they proliferate with the greatest luxuriance, or when the insatiable appetite of the Egyptians for embodying their gods in clay, stone and metal (to which our museums owe so much to-day) is confronted with the harsh prohibition against making an image of any living or imagined creature.

But there is still another contrast between the two religions which is not met by the explanations we have attempted. No other people of antiquity did so much to deny death or took such pains to make existence in the next world possible. And accordingly Osiris, the god of the dead, the ruler of this other world, was the most popular and undisputed of all the gods of Egypt. On the other hand the ancient Jewish religion renounced immortality entirely; the possibility of existence continuing after death is nowhere and never mentioned. And this is all the more remarkable since later experiences have shown that belief in an after-life is perfectly well compatible with a monotheist religion.

It was our hope that the hypothesis that Moses was an Egyptian would turn out to be fruitful and illuminating in various directions. But the first conclusion we drew from that hypothesis - that the new religion which he gave to the Jews was his own Egyptian one - has been invalidated by our realization of the different, and indeed contradictory, character of the two religions.

(2)

Another possibility is opened to us by a remarkable event in the history of the Egyptian religion, an event which has only lately been recognized and appreciated. It remains possible that the religion which Moses gave to his Jewish people was nevertheless his own - that it was *an* Egyptian religion, though not *the* Egyptian religion.

In the glorious Eighteenth Dynasty, under which Egypt first became a world power, a young Pharaoh came to the throne in about the year 1375 B.C. To begin with he was called, like his father, Amenophis (IV), but later he changed his name and not only his name. This king set about forcing a new religion on his Egyptian subjects - a religion which ran contrary to their thousands-of-years-old traditions and to all the familiar habits of their lives. It was a strict monotheism, the first attempt of the kind, so far as we know, in the history of the world, and along with the belief in a single god religious intolerance was inevitably born, which had previously been alien to the ancient world and remained so long afterwards. The reign of Amenophis, however, lasted for only seventeen years. Very soon after his death in 1358 B.C., the new religion was swept away and the memory of the heretic king was proscribed. What little we know of him is derived from the ruins of the new royal capital which he built and dedicated to his god and from the inscriptions in the rock tombs adjacent to it. Whatever we can learn about this remarkable and, indeed, unique personality is deserving of the highest interest.¹

¹ Breasted calls him 'the first individual in human history'.

Every novelty must have its preliminaries and preconditions in something earlier. The origins of Egyptian monotheism can be traced back a little way with some certainty.¹ For a considerable time, tendencies had been at work among the priesthood of the sun temple at On (Heliopolis) in the direction of developing the idea of a universal god and of emphasizing the ethical side of his nature. Ma'at, the goddess of truth, order and justice, was a daughter of the sun god Re'. During the reign of Amenophis III, the father and predecessor of the reformer, the worship of the sun god had already gained a new impetus - probably in opposition to Amun of Thebes, who had become too powerful. A very ancient name of the sun god, Aten or Atum, was brought into fresh prominence, and the young king found in this Aten religion a movement ready to hand, which he did not have to be the first to inspire but of which he could become an adherent.

The political conditions in Egypt had begun at this time to exercise a lasting influence on the Egyptian religion. As a result of the military exploits of the great conqueror, Tuthmosis III, Egypt had become a world power: the empire now included Nubia in the south, Palestine, Syria and a part of Mesopotamia in the north. This imperialism was reflected in religion as universalism and monotheism. Since the Pharaoh's responsibilities now embraced not only Egypt but Nubia and Syria as well, deity too was obliged to abandon its national limitation and, just as the Pharaoh was the sole and unrestricted ruler of the world known to the Egyptians, this must also apply to the Egyptians' new deity. Moreover, with the extension of the empire's frontiers, it was natural that Egypt would become more accessible to foreign influences; some of the royal wives were Asiatic princesses,² and it is possible that direct incitements to monotheism even made their way in from Syria.

¹ What follows is in the main based on the accounts given by Breasted (1906 and 1934) and in the relevant sections of the *Cambridge Ancient History*, Vol. II.

² This may perhaps be true even of Nefertiti, the beloved wife of Amenophis.

Amenophis never denied his adherence to the sun cult of On. In the two Hymns to the Aten which have survived in the rock tombs and which were probably composed by him himself, he praises the sun as the creator and preserver of all living things both inside and outside Egypt with an ardour which is not repeated till many centuries later in the Psalms in honour of the Jewish god Yahweh. He was not content, however, with this astonishing anticipation of the scientific discovery of the effect of solar radiation. There is no doubt that he went a step further: that he did not worship the sun as a material object but as the symbol of a divine being whose energy was manifested in its rays.¹

We should not, however, be doing justice to the king if we regarded him merely as an adherent or promoter of an Aten religion already in existence before his time. His activity was a far more energetic intervention. He introduced something new, which for the first time converted the doctrine of a universal god into monotheism - the factor of exclusiveness. In one of his hymns he declares expressly: 'O thou sole God, beside whom there is no other!'² And we must not forget that in assessing the new doctrine a knowledge of its *positive* contents is not enough: its *negative* side is almost equally important - a knowledge of what it rejects. It would be a mistake, too, to suppose that the new religion was completed at a single blow and sprang to life fully armed, like Athene out of the head of Zeus. Everything suggests, rather, that in the course of the reign of Amenophis it increased little by little to ever greater clarity, consistency, harshness and intolerance. It is likely that this development came about under the influence of the violent opposition to the king's reform which arose among the priests of Amun. In the sixth year of the reign of Amenophis this antagonism had reached such a pitch that the king changed his name, of which the proscribed name of the god Amun formed a part. Instead of 'Amenophis' he now called himself 'Akhenaten'.³ But it was not only from his own name that he expunged that of the detested god: he erased it too from every inscription - even where it occurred in the name of his father, Amenophis III. Soon after changing his name Akhenaten abandoned the Amun-dominated city of Thebes and built himself a new royal capital lower down the river, which he named Akhetaten (the horizon of the Aten). Its ruined site is now known as Tell el-'Amarna.⁴

¹ 'But, however evident the Heliopolitan origin of the new state religion might be, it was not merely sun-worship; the word Aton was employed in the place of the old word for "god" (*nuter*), and the god is clearly distinguished from the material sun.' Breasted, 1906, 360. - 'It is evident that what the king was deifying was the force by which the Sun made himself felt on earth.' Breasted, 1934, 279. - Erman (1905, 66) makes a similar judgement on a formula in honour of the god: 'These are . . . words which are meant to express as abstractly as possible that it is not the heavenly body itself that is worshipped but the being which reveals itself in it.'

² Breasted, 1906, 374 *n*.

³ I adopt here the English spelling of the name (alternatively 'Akhenaton'). The king's new name has approximately the same meaning as his earlier one: 'The god is satisfied.' Cf. the German 'Gotthold' and 'Gottfried'.

⁴ It was there that in 1887 the discovery - of such great historical importance - was made of the Egyptian kings' correspondence with their friends and vassals in Asia.

The persecution by the king fell most harshly upon Amun, but not on him alone. Throughout the kingdom temples were closed, divine service forbidden, temple property confiscated. Indeed, the king's zeal went so far that he had the ancient monuments examined in order to have the word 'god' obliterated in them where it occurred in the plural.¹ It is not to be wondered at that these measures taken by Akhenaten provoked a mood of fanatical vindictiveness among the suppressed priesthood and unsatisfied common people, and this was able to find free expression after the king's death. The Aten religion had not become popular; it had probably remained restricted to a narrow circle surrounding the king's person. Akhenaten's end remains veiled in obscurity. We hear of a few short-lived, shadowy successors from his own family. His son-law, Tut'ankhaten, was already compelled to return to Thebes and to replace the name of the god Aten in his name by that of Amun. There followed a period of anarchy till in 1350 B.C. a general, Haremhab, succeeded in restoring order. The glorious Eighteenth Dynasty was at an end and simultaneously its conquests in Nubia and Asia were lost. During this gloomy interregnum the ancient religions of Egypt were re-established. The Aten religion was abolished, Akhenaten's royal city was destroyed and plundered and his memory proscribed as that of a criminal.

¹ Breasted, 1906, 363.

It is with a particular purpose that we shall now emphasize a few points among the negative characteristics of the Aten religion. In the first place, everything to do with myths, magic and sorcery is excluded from it.¹ In the next place, the manner in which the sun-god was represented was no longer, as in the past, by a small pyramid and a falcon, but - and this seems almost prosaic - by a round disk with rays proceeding from it, which end in human hands. In spite of all the exuberant art of the Amarna period, no other representation of the sun-god - no personal image of the Aten - has been found, and it may confidently be said that none will be found.² Lastly, there was complete silence about the god of the dead, Osiris, and the kingdom of the dead. Neither the hymns nor the tomb inscriptions have any knowledge of what perhaps lay closest to the hearts of the Egyptians. The contrast to the popular religion cannot be more clearly demonstrated.³

¹ Weigall (1922, 120-1) says that Akhenaten would hear nothing of a Hell against whose terrors people might protect themselves with innumerable magical formulae: 'Akhnaton flung all these formulae into the fire. Djins, bogies, spirits, monsters, demigods, demons, and Osiris himself with all his court, were swept into the blaze and reduced to ashes.'

² 'Akhnaton did not permit any graven image to be made of the Aton. The True God, said the king, had no form; and he held to this opinion throughout his life.' (Weigall, 1922, 103.)

³ 'Nothing was to be heard any more of Osiris and his kingdom.' (Erman, 1905, 70.) - 'Osiris is completely ignored. He is never mentioned in any record of Ikhnaton or in any of the tombs at Amarna.' (Breasted, 1934, 291.)

(3)

I should now like to venture on this conclusion: if Moses was an Egyptian and if he communicated his own religion to the Jews, it must have been Akhenaten's, the Aten religion.

I have already compared the Jewish religion with the popular religion of Egypt and shown the opposition between them, I must now make a comparison between the Jewish and the Aten religions in the expectation of proving their original identity. This, I am aware, will present no easy task. Thanks to the vindictiveness of the priests of Amun we may perhaps know too little of the Aten religion. We only know the Mosaic religion in its final shape, as it was fixed by the Jewish priesthood some eight hundred years later in post-exilic times. If, in spite of this unfavourable state of the material, we find a few indications which favour our hypothesis, we shall be able to set a high value on them.

There would be a short path to proving our thesis that the Mosaic religion was none other than that of the Aten - namely, if we had a confession of faith, a declaration. But I fear we shall be told that this path is closed to us. The Jewish confession of faith, as is well known, runs: 'Schema Jisroel Adonai Elohenu Adonai Echod.' If it is not merely by chance that the name of the Egyptian Aten (or Atum) sounds like the Hebrew word *Adonai* and the name of the Syrian deity Adonis, but if it is due to a primaeval kinship of speech and meaning, then the Jewish formula might be translated thus: 'Hear, O Israel: our god Aten (Adonai) is a sole god.' Unfortunately I am totally incompetent to answer this question, and I have been able to find but little about it in the literature of the subject.¹ But in all probability this is making things too easy for us. In any case we shall have to come back once more to the problems concerning the name of the god.

¹ Only a few passages in Weigall (1922, 12 and 19), to the effect that 'the god Atum, the aspect of Ra as the setting sun, was probably of common origin with Aton who was largely worshipped in North Syria', and that a 'foreign queen with her retinue may have therefore felt more sympathy with Heliopolis than with Thebes.'

The similarities as well as the differences between the two religions are easily discernible without giving us much light. Both of them were forms of a strict monotheism, and we shall be inclined *a priori* to trace back what they had in common to this fundamental characteristic. Jewish monotheism behaved in some respects even more harshly than the Egyptian: for instance in forbidding pictorial representations of any kind. The most essential difference is to be seen (apart from their gods' names) in the fact that the Jewish religion was entirely without sun worship, in which the Egyptian one still found support. When we were making the comparison with the popular religion of Egypt, we had an impression that, apart from the fundamental contrast, a factor of *intentional* contradiction played a part in the difference between the two religions. This impression seems to be justified if now, in making the comparison, we replace the Jewish religion by the Aten religion which, as we know, was developed by Akhenaten in deliberate hostility to the popular one. We were rightly surprised to find that the Jewish religion would have nothing to do with the next world or a life after death, though a doctrine of that kind would have been compatible with the strictest monotheism. But this surprise vanishes if we turn back from the Jewish to the Aten religion and suppose that this refusal was taken over from it, since for Akhenaten it was a necessity in his fight against the popular religion, in which Osiris, the god of the dead, played a greater part, perhaps, than any god in the upper world. The agreement between the Jewish and the Aten religions on this important point is the first strong argument in favour of our thesis. We shall learn that it is not the only one.

Moses did not only give the Jews a new religion; it can be stated with equal certainty that he introduced the custom of circumcision to them. This fact is of decisive importance for our problem and has scarcely ever been considered. It is true that the Biblical account contradicts this more than once. On the one hand it traces circumcision back to the patriarchal age as a mark of a covenant between God and Abraham; on the other hand it describes in a quite particularly obscure passage how God was angry with Moses for having neglected a custom which had become holy,¹ and sought to kill him; but that his wife, a Midianite, saved her husband from God's wrath by quickly performing the operation. These, however, are distortions, which should not lead us astray; later on we shall discover the reason for them. The fact remains that there is only one answer to the question of where the Jews derived the custom of circumcision from - namely, from Egypt. Herodotus, the 'father of history', tells us that the custom of circumcision had long been indigenous in Egypt, and his statements are confirmed by the findings in mummies and indeed by pictures on the walls of tombs. No other people of the Eastern Mediterranean, so far as we know, practised this custom; it may safely be presumed that the Semites, Babylonians and Sumerians were uncircumcised. The Bible story itself says this is so of the inhabitants of Canaan; it is a necessary premiss to the adventure of Jacob's daughter and the prince of Shechem.² The possibility that the Jews acquired the custom of circumcision during their sojourn in Egypt in some way other than in connection with the religious teaching of Moses may be rejected as completely without foundation. Now, taking it as certain that circumcision was a universal popular custom in Egypt, let us for a moment adopt the ordinary hypothesis that Moses was a Jew, who sought to free his compatriots from bondage in Egypt and lead them to develop an independent and self-conscious national existence in another country - which was what in fact happened. What sense could it have, in that case, that he should at the same time impose on them a troublesome custom which even, to some extent, made them into Egyptians and which must keep permanently alive their memory of Egypt - whereas his efforts could only be aimed in the opposite direction, towards alienating his people from the land of their bondage and overcoming their longing for the 'flesh-pots of Egypt'? No, the fact from which we started and the hypothesis which we added to it are so incompatible with each other that we may be bold enough to reach this conclusion: if Moses gave the Jews not only a new religion but also the commandment for circumcision, he was not a Jew but an Egyptian, and in that case the Mosaic religion was probably an Egyptian one and, in view of its contrast to the popular religion, the religion of the Aten, with which the later Jewish religion agrees in some remarkable respects.

¹ 'Heilig.'

² I am very well aware that in dealing so autocratically and arbitrarily with Biblical tradition - bringing it up to confirm my views when it suits me and unhesitatingly rejecting it when it contradicts me - I am exposing myself to serious methodological criticism and weakening the convincing force of my arguments. But this is the only way in which one can treat material of which one knows definitely that its trustworthiness has been severely impaired by the distorting influence of tendentious purposes. It is to be hoped that I shall find some degree of justification later on, when I come upon the track of these secret motives. Certainty is in any case unattainable and moreover it may be said that every other writer on the subject has adopted the same procedure.

I have pointed out that my hypothesis that Moses was not a Jew but an Egyptian created a fresh riddle. His course of conduct, which seemed easily intelligible in a Jew, was understandable in an Egyptian. If, however, we place Moses in the time of Akhenaten and suppose him in contact with that Pharaoh, the riddle vanishes and the possibility is revealed of motives which will answer all our questions. Let us start from the assumption that Moses was an aristocratic and prominent man, perhaps in fact a member of the royal house, as the legend says of him. He was undoubtedly aware of his great capacities, ambitious and energetic; he may even have played with the notion of one day being the leader of his people, of becoming the kingdom's ruler. Being close to the Pharaoh, he was a convinced adherent of the new religion, whose basic thoughts he had made his own. When the king died and the reaction set in, he saw all his hopes and prospects destroyed; if he was not prepared to abjure all the convictions that were so dear to him, Egypt had nothing more to offer him - he had lost his country. In this predicament he found an unusual solution. Akhenaten the dreamer had alienated his people and let his empire fall to pieces. The more energetic nature of Moses was more at home with the plan of founding a new kingdom, of finding a new people to whom he would present for their worship the religion which Egypt had disdained. It was, we can see, a heroic attempt to combat destiny, to compensate in two directions for the losses in which Akhenaten's catastrophe had involved him. Perhaps he was at that time Governor of the frontier province (Goshen) in which certain Semitic tribes had settled (perhaps as early as in the Hyksos period). These he chose to be his new people - a historic decision.¹ He came to an agreement with them, put himself at their head and carried the Exodus through 'by strength of hand'. In complete contrast to the Biblical tradition, we may presume that this Exodus took place peacefully and unpursued. The authority of Moses made this possible and at that time there was no central administration which might have interfered with it.

According to this construction of ours, the Exodus from Egypt would have occurred during the period between 1358 and 1350 B.C. - that is, after Akhenaten's death and before Haremhab's re-establishment of state authority.² The goal of the migration could only have been the land of Canaan. After the collapse of the Egyptian domination, hordes of warlike Aramaeans had irrupted into that region, conquering and plundering, and had shown in that way where a capable people might win fresh land for themselves. We learn of these warriors from the letters found in 1887 in the ruined city of Amarna. There they are called 'Habiru', and the name was transferred (we do not know how) to the later Jewish invaders - 'Hebrews' - who cannot be intended in the Amarna letters. South of Palestine, too, in Canaan, there lived the tribes which were the nearest relatives of the Jews who were now making their way out of Egypt.

¹ If Moses was a high official, this makes it easier to understand the role of leader which he assumed with the Jews; if he was a priest, then it was natural for him to emerge as the founder of a religion. In both these cases he would have been continuing his former profession. A prince of the royal house might easily have been both - a provincial governor and a priest. In the account given by Flavius Josephus (in his *Jewish Antiquities*), who accepts the exposure legend but seems to be in touch with traditions other than the Biblical one, Moses, as an Egyptian general, fought a victorious campaign in Ethiopia.

² This would make the Exodus about a century earlier than is supposed by most historians, who put it in the Nineteenth Dynasty under Merenptah. Or it may have happened a little later, for the official histories seem to have included the interregnum in the reign of Haremhab.

The motives which we have discovered for the Exodus as a whole apply also to the introduction of circumcision. We are familiar with the attitude adopted by people (both nations and individuals) to this primæval usage, which is scarcely understood any longer. Those who do not practise it look on it as very strange and are a little horrified by it, but those who have adopted circumcision are proud of it. They feel exalted by it, ennobled, as it were, and look down with contempt on the others, whom they regard as unclean. Even to this day a Turk will abuse a Christian as an 'uncircumcised dog'. It may be supposed that Moses, who, being an Egyptian, was himself circumcised, shared this attitude. The Jews with whom he departed from his country were to serve him as a superior substitute for the Egyptians he had left behind. On no account must the Jews be inferior to them. He wished to make them into a 'holy nation', as is expressly stated in the Biblical text, and as a mark of this consecration he introduced among them too the custom which made them at least the equals of the Egyptians. And he could only welcome it if they were to be isolated by such a sign and kept apart from the foreign peoples among whom their wanderings would lead them, just as the Egyptians themselves had kept apart from all foreigners.¹

Later on, however, Jewish tradition behaved as though it were put at a disadvantage by the inference we have been drawing. If it were to be admitted that circumcision was an Egyptian custom introduced by Moses, that would be almost as much as to recognize that the religion delivered to them by Moses was an Egyptian one too. There were good reasons for denying that fact, so the truth about circumcision must also be contradicted.

¹ Herodotus, who visited Egypt about 450 B.C., enumerates in his account of his journey characteristics of the Egyptian people which exhibit an astonishing similarity to traits familiar to us in later Jewry: 'They are altogether more religious in every respect than any other people, and differ from them too in a number of their customs. Thus they practise circumcision, which they were the first to introduce, and on grounds of cleanliness. Further they have a horror of pigs, which is no doubt related to the fact that Seth in the form of a black pig wounded Horus. And lastly and most markedly, they hold cows in the greatest honour, and would never eat or sacrifice them, because this would offend Isis with her cows horns. For that reason no Egyptian man or woman would ever kiss a Greek or use his knife or his spit or his cauldron or eat the flesh of an otherwise clean ox if it had been cut with a Greek knife . . . They look down in narrow-minded pride on other people, who are unclean and are not so close to the gods as they are.' (Erman, 1905, 181.) - We must not, of course, overlook parallels to this in the life of the Indian people. - And, incidentally, who suggested to the Jewish poet Heine in the nineteenth century A.D. that he should complain of his religion as 'the plague dragged along from the Nile valley, the unhealthy beliefs of Ancient Egypt'?

(4)

At this point I expect to be met by an objection to my hypothesis. This placed Moses, an Egyptian, in the Akhenaten period. It derived his decision to take over the Jewish people from the political circumstances in the country at that time, and it recognized the religion that he presented to or imposed on his *protégés* as the Aten religion, which had actually collapsed in Egypt itself. I expect to be told that I have brought forward this structure of conjectures with too much positiveness, for which there is no basis in the material. This objection is, I think, unjustified. I have already laid stress on the factor of doubt in my introductory remarks; I have, as it were, placed that factor outside the brackets and I may be allowed to save myself the trouble of repeating it in connection with each item *inside* them.

I may continue the discussion with a few critical remarks of my own. The kernel of my hypothesis - the dependence of Jewish monotheism on the monotheist episode in Egyptian history - has been suspected and mentioned by various writers. I spare myself the trouble of quoting these opinions here, since none of them is able to indicate how this influence can have come into operation. Even though in our view that influence remains linked to the figure of Moses, we ought also to mention some other possibilities in addition to the one we prefer. It must not be supposed that the fall of the official Aten religion brought the monotheist current in Egypt to a complete stop. The priesthood at On, from which it started, survived the catastrophe and may have continued to bring under the sway of its trend of ideas generations after Akhenaten's. Thus the action taken by Moses is still conceivable even if he did not live at the time of Akhenaten and did not fall under his personal influence, if he was only an adherent or perhaps a member of the priesthood of On. This possibility would postpone the date of the Exodus and bring it closer to the date which is usually adopted (in the thirteenth century); but it has nothing else to recommend it. Our insight into the motives of Moses would be lost and the facilitation of the Exodus by the prevailing anarchy in the country would no longer apply. The succeeding kings of the Nineteenth Dynasty established a strong *régime*. It was only during the period immediately after the heretic king's death that there was a convergence of all the conditions, external and internal alike, that were favourable to the Exodus.

The Jews possess a copious literature apart from the Bible, in which the legends and myths are to be found which grew up in the course of centuries round the imposing figure of their first leader and the founder of their religion, and which have both illuminated and obscured it. Scattered in this material there may be fragments of trustworthy tradition for which no room was found in the Pentateuch. A legend of this sort gives an engaging account of how the ambition of the man Moses found expression even in his childhood. Once when Pharaoh had taken him in his arms and playfully lifted him high in the air, the little three-year-old boy snatched the crown from the king's head and put it on his own. This portent alarmed the king, who did not fail to consult his wise men about it.¹ There are stories elsewhere of his victorious military actions as an Egyptian general in Ethiopia, and, in this connection, how he fled from Egypt because he had reason to be afraid of the envy of a party at Court or of Pharaoh himself. The Biblical account itself attributes some features to Moses to which credence may well be given. It describes him as being of an irascible nature, flaring up easily, as when, in indignation, he slew the brutal overseer who was ill-treating a Jewish workman, or when in his anger at the people's apostasy he broke the Tables of the Law which he had brought down from the Mount of God; indeed God himself punished him in the end for an impatient deed, but we are not told what it was. Since a trait of this kind is not one that would serve for his glorification, it may perhaps correspond to a historical truth. Nor can the possibility be excluded that some of the character traits which the Jews included in their early picture of their God - describing him as jealous, severe and ruthless - may have been at bottom derived from a recollection of Moses; for in fact it was not an invisible God but the man Moses who brought them out of Egypt.

¹ This anecdote, in a slightly different form, also appears in Josephus.

Another trait attributed to Moses has a special claim to our interest. Moses is said to have been 'slow of speech': he must have suffered from an inhibition or disorder of speech. Consequently, in his supposed dealings with Pharaoh, he needed the support of Aaron, who is called his brother. This again may be a historical truth and would make a welcome contribution to presenting a lively picture of the great man. But it may also have another and more important significance. It may recall, slightly distorted, the fact that Moses spoke another language and could not communicate with his Semitic neo-Egyptians without an interpreter, at all events at the beginning of their relations - a fresh confirmation, then, of the thesis that Moses was an Egyptian.

Now, however, or so it seems, our work has reached a provisional end. For the moment we can draw no further conclusions from our hypothesis that Moses was an Egyptian, whether it has been proved or not. No historian can regard the Biblical account of Moses and the Exodus as anything other than a pious piece of imaginative fiction, which has recast a remote tradition for the benefit of its own tendentious purposes. The original form of that tradition is unknown to us; we should be glad to discover what the distorting purposes were, but we are kept in the dark by our ignorance of the historical events. The fact that our reconstruction leaves no room for a number of show-pieces in the Bible story, such as the ten plagues, the passage of the Red Sea and the solemn law-giving on Mount Sinai - this does not disconcert us. But we cannot treat it as a matter of indifference if we find ourselves in contradiction to the findings of the sober historical researches of the present day.

These modern historians, of whom we may take Eduard Meyer (1906) as a representative, agree with the Bible story on one decisive point. They too are of opinion that the Jewish tribes, which later developed into the people of Israel, took on a new religion at a certain point of time. But in their view this did not take place in Egypt or at the foot of a mountain in the Sinai Peninsula, but in a certain locality known as Meribah Kadesh, an oasis distinguished by its wealth of springs and wells in the stretch of country south of Palestine, between the eastern exit from the Sinai Peninsula and the western border of Arabia. There they took over the worship of a god Yahweh, probably from the neighbouring Arabian tribe of Midianites. It seems likely that other tribes in the vicinity were also followers of this god.

Yahweh was unquestionably a volcano god. Now, as is well known, Egypt is without volcanoes and the mountains of the Sinai Peninsula have never been volcanic; on the other hand, there are volcanoes which may have been active till recent times along the western border of Arabia. So one of these mountains must have been the Sinai-Horeb which was regarded as the home of Yahweh.¹ In spite of all the revisions to which the Biblical story was subjected, the original picture of the god's character can, according to Eduard Meyer, be reconstructed: he was an uncanny, bloodthirsty demon who went about by night and shunned the light of day.²

The mediator between God and the people in the founding of this religion was named Moses. He was the son-in-law of the Midianite priest Jethro, and was keeping his flocks when he received the summons from God. He was also visited by Jethro at Kadesh and given some advice by him.

Though Eduard Meyer says, it is true, that he never doubted that there was some historical core in the story of the sojourn in Egypt and the catastrophe to the Egyptians,³ he evidently does not know how to place and what use to make of this fact which he recognizes. The only thing he is prepared to derive from Egypt is the custom of circumcision. He adds two important indications which go to confirm our previous arguments: first, that Joshua ordered the people to be circumcised in order to 'roll away the reproach of Egypt from off you', and secondly a quotation from Herodotus saying that 'the Phoenicians (no doubt the Jews) and the Syrians of Palestine themselves admit that they learnt the custom of the Egyptians'.⁴ But he has little to say in favour of an Egyptian Moses: 'The Moses we know is the ancestor of the priests of Kadesh - that is, a figure from a genealogical legend, standing in relation to a cult, and not a historical personality. Thus (apart from those who accept tradition root and branch as historical truth) no one who treats him as a historical figure has been able to give any content to him, to represent him as a concrete individual or to point out what he may have done and what his historical work may have been.'⁵

¹ At a few places in the Biblical text it is still stated that Yahweh came down from Sinai to Meribah-Kadesh.

² Meyer, 1906, 38 and 58.

³ Meyer, 1906, 49.

⁴ Meyer, 1906, 449.

⁵ Meyer, 1906, 451.

On the other hand, Meyer is never tired of insisting on the relation of Moses to Kadesh and Midian: 'The figure of Moses, which is intimately bound up with Midian and the cult-centres in the desert . . .'¹ and: 'This figure of Moses, then, is inseparably linked with Kadesh (Massah and Meribah) and this is supplemented by his being the son-in-law of the Midianite priest. His link with the Exodus, on the contrary, and the whole story of his youth are entirely secondary and simply the consequence of the interpolation of Moses into a connected and continuous legendary story.'² Meyer also points out that the themes included in the story of the youth of Moses were one and all dropped later: 'Moses in Midian is no longer an Egyptian and grandson of Pharaoh, but a shepherd to whom Yahweh revealed himself. In telling of the plagues there is no longer any talk of his former connections, though effective use might easily have been made of them, and the command to kill the sons of the Israelites is completely forgotten. In the Exodus and the destruction of the Egyptians Moses plays no part whatever: he is not even mentioned. The heroic character which the legend of his childhood presupposes is totally absent from the later Moses; he is only the man of God, a miracle-worker equipped by Yahweh with supernatural powers.'³

¹ Meyer, 1906, 49.

² Meyer, 1906, 72.

³ Meyer, 1906, 47.

We cannot dispute the impression that this Moses of Kadesh and Midian, to whom tradition could actually attribute the erection of a brazen serpent as a god of healing, is someone quite other than the aristocratic Egyptian inferred by us, who presented the people with a religion in which all magic and spells were proscribed in the strictest terms. Our Egyptian Moses is no less different, perhaps, from the Midianite Moses than is the universal god Aten from the demon Yahweh in his home on the Mount of God. And if we have any faith at all in the pronouncements of the recent historians, we shall have to admit that the thread which we have tried to spin from our hypothesis that Moses was an Egyptian has broken for the second time. And this time, as it seems, with no hope of mending.

(5)

Unexpectedly, here once more a way of escape presents itself. Efforts to see in Moses a figure that goes beyond the priest of Kadesh, and to confirm the grandeur with which tradition glorifies him, have not ceased even since Eduard Meyer. (Cf. Gressmann and others.) Then, in 1922, Ernst Sellin made a discovery which affected our problem decisively. He found in the Prophet Hosea (in the second half of the eighth century B.C.) unmistakable signs of a tradition to the effect that Moses, the founder of their religion, met with a violent end in a rising of his refractory and stiff-necked people, and that at the same time the religion he had introduced was thrown off. This tradition is not, however, restricted to Hosea; it reappears in most of the later Prophets, and indeed, according to Sellin, became the basis of all the later Messianic expectations. At the end of the Babylonian captivity a hope grew up among the Jewish people that the man who had been so shamefully murdered would return from the dead and would lead his remorseful people, and perhaps not them alone, into the kingdom of lasting bliss. The obvious connection of this with the destiny of the founder of a later religion does not concern us here.

Once again I am not, of course, in a position to judge whether Sellin has interpreted the passages from the Prophets correctly. But if he is right we may attribute historical credibility to the tradition he has recognized, for such things are not readily invented. There is no tangible motive for doing so; but if they have really happened, it is easy to understand that people will be anxious to forget them. We need not accept all the details of the tradition. In Sellin's opinion Shittim, in the country east of the Jordan, is to be regarded as the scene of the attack on Moses. But we shall soon see that that region is not acceptable for our notions.

We will borrow from Sellin his hypothesis that the Egyptian Moses was murdered by the Jews and the religion he had introduced abandoned. This allows us to spin our threads further without contradicting the authentic findings of historical research. But apart from this we shall venture to maintain independence of the authorities and to 'proceed along our own track'. The Exodus from Egypt remains our starting-point. A considerable number of people must have left the country with Moses; a small collection would not have seemed worth while to this ambitious man with his large aims in view. The immigrants had probably been living in Egypt long enough to have grown into quite a large population. But we shall certainly not be going wrong if we assume, with the majority of the authorities, that only a fraction of what was later to be the Jewish people had experienced the events in Egypt. In other words, the tribe that returned from Egypt joined up later, in the stretch of country between Egypt and Canaan, with other kindred tribes, which had been settled there for a considerable time. This union, from which sprang the people of Israel, found expression in the adoption of a new religion, common to all the tribes, the religion of Yahweh - an event which, according to Eduard Meyer, took place under Midianite influence at Kadesh. Thereafter, the people felt strong enough to undertake their invasion of the land of Canaan. It would not tally with this course of events to suppose that the catastrophe to Moses and his religion occurred in the country east of the Jordan; it must have happened long before the union of the tribes.

There can be no doubt that very different elements came together in the construction of the Jewish people; but what must have made the greatest difference among these tribes was whether they had experienced or not the sojourn in Egypt and what followed it. Having regard to this point, we may say that the nation arose out of a union of two component parts; and it fits in with this that, after a short period of political unity, it split into two pieces - the kingdom of Israel and the kingdom of Judah. History is fond of reinstatements like this, where a later fusion is undone and an earlier separation re-emerges. The most impressive example of this was afforded, as is well known, by the Reformation, which, after an interval of over a thousand years, brought to light once more the frontier between the Germany which had at one time been Roman and the Germany which had remained independent. In the instance of the Jewish people it is not possible to point to such a faithful reproduction of the old state of things; our knowledge of those times is too uncertain to allow us to assert that the settled tribes were once more to be found together in the Northern Kingdom and those who had returned from Egypt in the Southern Kingdom; but here too the later split cannot have been unrelated to the earlier joining up. The former Egyptians were probably fewer in numbers than the others, but showed themselves culturally the stronger. They exercised a more powerful influence on the further evolution of the people, because they brought along with them a tradition which the others lacked.

Perhaps they brought something else with them more tangible than a tradition. One of the greatest enigmas of Jewish prehistory is that of the origin of the Levites. They are traced back to one of the twelve tribes of Israel - that of Levi - but no tradition has ventured to say where that tribe was originally located or what portion of the conquered land of Canaan was allotted to it. They filled the most important priestly offices, but they were distinct from the priests. A Levite is not necessarily a priest; nor is it the name of a caste. Our hypothesis about the figure of Moses suggests an explanation. It is incredible that a great lord, like Moses the Egyptian, should have joined this alien people unaccompanied. He certainly must have brought a retinue with him - his closest followers, his scribes, his domestic servants. This is who the Levites originally were. The tradition which alleges that Moses was a Levite seems to be a clear distortion of the fact: the Levites were the followers of Moses. This solution is supported by the fact which I have already mentioned in my earlier essay that it is only among the Levites that Egyptian names occur later.¹ It is to be presumed that a fair number of these followers of Moses escaped the catastrophe which descended on him himself and the religion he founded. They multiplied in the course of the next generations, became fused with the people they lived among, but remained loyal to their master, preserved his memory and carried out the tradition of his doctrines. At the time of the union with the disciples of Yahweh they formed an influential minority, culturally superior to the rest.

¹ My hypothesis fits in well with Yahuda's statements on the Egyptian influence on early Jewish literature. See Yahuda, 1929.

I put it forward as a provisional hypothesis that between the fall of Moses and the establishment of the new religion at Kadesh two generations, or perhaps even a century, elapsed. I see no means of deciding whether the Neo-Egyptians (as I should like to call them here) - that is, those who returned from Egypt - met their tribal kinsmen after the latter had already adopted the Yahweh religion or earlier. The second possibility might seem the more probable. But there would be no difference in the outcome. What happened at Kadesh was a compromise, in which the share taken by the tribes of Moses is unmistakable.

Here we may once again call on the evidence afforded by circumcision, which has repeatedly been of help to us, like, as it were, a key-fossil. This custom became obligatory in the Yahweh religion as well and, since it was indissolubly linked with Egypt, its adoption can only have been a concession to the followers of Moses, who - or the Levites among them - would not renounce this mark of their holiness. So much of their old religion they wished to rescue, and in return for it they were prepared to accept the new deity and what the priests of Midian told them about it. They may possibly have gained yet other concessions. We have already mentioned that Jewish ritual prescribed certain restrictions on the use of God's name. Instead of 'Yahweh' the word 'Adonai' must be spoken. It is tempting to bring this prescription into our context, but that is only a conjecture without any other basis. The prohibition upon a god's name is, as is well known, a taboo of *primaeval* age. We do not understand why it was revived precisely in the Jewish Law; it is not impossible that this happened under the influence of a fresh motive. There is no need to suppose that the prohibition was carried through consistently; in the construction of theophorous personal names - that is, in compounds - the name of the God Yahweh might be freely used (e.g. Jochanan, Jehu, Joshua). There were, however, special circumstances connected with this name. As we know, critical Biblical research supposes that the Hexateuch has two documentary sources. These are distinguished as J and E, because one of them uses 'Jahve' as the name of God and the other 'Elohim': 'Elohim', to be sure, not 'Adonai'. But we may bear in mind a remark by one of our authorities: 'The different names are a clear indication of two originally different gods.'¹

¹ Gressmann, 1913, 54.

We brought up the retention of circumcision as evidence for the fact that the founding of the religion at Kadesh involved a compromise. We can see its nature from the concordant accounts given by J and E, which thus go back on this point to a common source (a documentary or oral tradition). Its leading purpose was to demonstrate the greatness and power of the new god Yahweh. Since the followers of Moses attached so much value to their experience of the Exodus from Egypt, this act of liberation had to be represented as due to Yahweh, and the event was provided with embellishments which gave proof of the terrifying grandeur of the volcano god - such as the pillar of smoke which changed at night into a pillar of fire and the storm which laid bare the bed of the sea for a while, so that the pursuers were drowned by the returning waters. This account brought the Exodus and the founding of the religion close together, and disavowed the long interval between them. So, too, the law-giving was represented as occurring not at Kadesh but at the foot of the Mount of God, marked by a volcanic eruption. This account, however, did grave injustice to the memory of the man Moses; it was he and not the volcano god who had liberated the people from Egypt. So a compensation was owing to him, and it consisted in the man Moses being transferred to Kadesh or to Sinai-Horeb and put in the place of the Midianite priests. We shall find later that this solution satisfied another imperatively pressing purpose. In this manner a mutual agreement, as it were, was arrived at: Yahweh, who lived on a mountain in Midian, was allowed to extend over into Egypt, and, in exchange for this, the existence and activity of Moses were extended to Kadesh and as far as the country east of the Jordan. Thus he was fused with the figure of the later religious founder, the son-in-law of the Midianite Jethro, and lent him his name of Moses. Of this second Moses, however, we can give no personal account - so completely was he eclipsed by the first, the Egyptian Moses - unless we pick out the contradictions in the Biblical description of the character of Moses. He is often pictured as domineering, hot-tempered and even violent, yet he is also described as the mildest and most patient of men. These last qualities would evidently have fitted in badly with the Egyptian Moses, who had to deal with his people in such great and difficult matters; they may have belonged to the character of the other Moses, the Midianite. We are, I think, justified in separating the two figures and in assuming that the Egyptian Moses was never at Kadesh and had never heard the name of Yahweh, and that the Midianite Moses had never been in Egypt and knew nothing of Aten. In order to solder the two figures together, tradition or legend had the task of bringing the Egyptian Moses to Midian, and we have seen that more than one explanation of this was current.

(6)

Once again I am prepared to find myself blamed for having presented my reconstruction of the early history of the people of Israel with too great and unjustified certainty. I shall not feel very severely hit by this criticism, since it finds an echo in my own judgement. I know myself that my structure has its weak spots, but it has its strong points too. On the whole my predominant impression is that it is worth while to pursue the work in the direction it has taken.

The Bible narrative that we have before us contains precious and, indeed, invaluable historical data, which, however, have been distorted by the influence of powerful tendentious purposes and embellished by the products of poetic invention. In the course of our efforts so far, we have been able to detect one of these distorting purposes. That discovery points our further path. We must uncover other similar tendentious purposes. If we find means of recognizing the distortions produced by those purposes, we shall bring to light fresh fragments of the true state of things lying behind them.

And we will begin by listening to what critical Biblical research is able to tell us about the history of the origin of the Hexateuch, the five books of Moses and the book of Joshua, which alone concern us here.¹ The earliest documentary source is accepted as J (the Yahwistic writer), who in the most recent times has been identified as the priest Ebyatar, a contemporary of King David.² Somewhat - it is not known how much - later we come to the so-called Elohist writer, who belonged to the Northern Kingdom.³ After the collapse of the Northern Kingdom in 722 B.C., a Jewish priest combined portions of J and E and made some additions of his own. His compilation is designated as JE. In the seventh century *Deuteronomy*, the fifth book, was added to this. It is supposed to have been found complete in the Temple. In the period after the destruction of the Temple (586 B.C.), during and after the Exile, the revision known as the 'Priestly Code' was compiled; and in the fifth century the work was given its final revision and since then has not been changed in its essentials.⁴

¹ *Encyclopaedia Britannica*, Eleventh Edition, Vol. III, 1910. Article 'Bible'.

² See Auerbach (1932).

³ The Yahwistic and Elohist writings were first distinguished by Astruc in 1753.

⁴ It is historically certain that the Jewish type was finally fixed as a result of the reforms of Ezra and Nehemiah in the fifth century before Christ - that is, after the Exile, under the Persian domination which was friendly to the Jews. On our reckoning, some nine hundred years had passed since the emergence of Moses. These reforms took seriously the regulations that aimed at making the entire people holy; their separation from their neighbours was made effective by the prohibition of mixed marriages; the Pentateuch, the true book of the laws, was given its final form and the revision known as the Priestly Code brought to completion. It seems certain, however, that these reforms introduced no fresh tendentious purposes, but took up and strengthened earlier trends.

The history of King David and of his period is most probably the work of a contemporary. It is genuine historical writing, five hundred years before Herodotus, the 'father of History'. It becomes easier to understand this achievement if, on the lines of our hypothesis, we think of Egyptian influence.¹ A suspicion even arises that the Israelites of that earliest period - that is to say, the scribes of Moses - may have had some share in the invention of the first alphabet.² It is, of course, beyond our knowledge to discover how far reports about former times go back to early records or to oral tradition and how long an interval of time there was in individual instances between an event and its recording. The text, however, as we possess it to-day, will tell us enough about its own vicissitudes. Two mutually opposed treatments have left their traces on it. On the one hand it has been subjected to revisions which have falsified it in the sense of their secret aims, have mutilated and amplified it and have even changed it into its reverse; on the other hand a solicitous piety has presided over it and has sought to preserve everything as it was, no matter whether it was consistent or contradicted itself. Thus almost everywhere noticeable gaps, disturbing repetitions and obvious contradictions have come about - indications which reveal things to us which it was not intended to communicate. In its implications the distortion of a text resembles a murder: the difficulty is not in perpetrating the deed, but in getting rid of its traces. We might well lend the word '*Entstellung*' the double meaning to which it has a claim but of which to-day it makes no use. It should mean not only 'to change the appearance of something' but also 'to put something in another place, to displace'. Accordingly, in many instances of textual distortion, we may nevertheless count upon finding what has been suppressed and disavowed hidden away somewhere else, though changed and torn from its context. Only it will not always be easy to recognize it.

¹ Cf. Yahuda, 1929.

² If they were subject to the prohibition against pictures they would even have had a motive for abandoning the hieroglyphic picture writing while adapting its written characters to expressing a new language. (Cf. Auerbach, 1932.)

The distorting purposes which we are anxious to lay hold of must have been at work already on the traditions before any of them were committed to writing. We have already discovered one of them, perhaps the most powerful of all. As we have said, with the setting-up of the new god, Yahweh, at Kadesh, it became necessary to do something to glorify him. It would be more correct to say: it became necessary to fit him in, to make room for him, to wipe out the traces of earlier religions. This seems to have been achieved with complete success as regards the religion of the resident tribes: we hear nothing more of it. With those returning from Egypt it was not such an easy matter; they would not let themselves be deprived of the Exodus, the man Moses or circumcision. It is true that they had been in Egypt, but they had left it, and thenceforward every trace of Egyptian influence was to be disavowed. The man Moses was dealt with by shifting him to Midian and Kadesh, and by fusing him with the priest of Yahweh who founded the religion. Circumcision, the most suspicious indication of dependence on Egypt, had to be retained but no attempts were spared to detach the custom from Egypt - all evidence to the contrary. It is only as a deliberate denial of the betraying fact that we can explain the puzzling and incomprehensibly worded passage in *Exodus*, according to which on one occasion Yahweh was angry with Moses because he had neglected circumcision, and his Midianite wife saved his life by quickly carrying out the operation. We shall presently come across another invention for making the uncomfortable piece of evidence harmless.

The fact that we find signs of efforts being made to deny explicitly that Yahweh was a new god, alien to the Jews, can scarcely be described as the appearance of a fresh tendentious purpose: it is rather a continuation of the former one. With this end in view the legends of the patriarchs of the people - Abraham, Isaac and Jacob - were introduced. Yahweh asserted that he was already the god of these forefathers; though it is true that he himself had to admit that they had not worshipped him under that name.¹ He does not add, however, what the other name was.

¹ This does not make the restrictions upon the use of this new name more intelligible, though it does make them more suspect.

And here was the opportunity for a decisive blow against the Egyptian origin of the custom of circumcision: Yahweh, it was said, had already insisted on it with Abraham and had introduced it as the token of the covenant between him and Abraham. But this was a particularly clumsy invention. As a mark that is to distinguish one person from others and prefer him to them, one would choose something that is not to be found in other people; one would *not* choose something that can be exhibited in the same way by millions of other people. An Israelite who was transplanted to Egypt would have had to acknowledge every Egyptian as a brother in the covenant, a brother in Yahweh. It is impossible that the Israelites who created the text of the Bible can have been ignorant of the fact that circumcision was indigenous in Egypt. The passage in Joshua quoted by Eduard Meyer admits this without question but for that very reason it had to be disavowed at any price.

We must not expect the mythical structures of religion to pay too much attention to logical coherence. Otherwise popular feeling might have taken justified offence against a deity who made a covenant with their forefathers with mutual obligations and then, for centuries on end, paid no attention to his human partners, till it suddenly occurred to him to manifest himself anew to their descendants. Even more puzzling is the notion of a god's all at once 'choosing' a people, declaring them to be his people and himself to be their god. I believe this is the only instance of its sort in the history of human religions. Ordinarily god and people are indissolubly linked, they are one from the very beginning of things. No doubt we sometimes hear of a people taking on a different god, but never of a god seeking a different people. We may perhaps understand this unique event better if we recall the relations between Moses and the Jewish people. Moses had stooped to the Jews, had made them his people: they were his 'chosen people'.¹

¹ Yahweh was undoubtedly a volcano god. There was no occasion for the inhabitants of Egypt to worship him. I am certainly not the first person to be struck by the resemblance of the sound of the name 'Yahweh' to the root of the other divine name 'Jupiter (Jove)'. The name 'Jochanan' is compounded with an abbreviation of the Hebrew Yahweh - in the same kind of way as 'Gotthold' and the Carthaginian equivalent 'Hannibal'. This name (Jochanan), in the forms 'Johann', 'John', 'Jean', 'Juan', has become the favourite first name in European Christendom. The Italians, in rendering it 'Giovanni' and moreover calling a day of the week 'Giovedi', are bringing to light a resemblance which may possibly mean nothing or possibly a very great deal. At this point, extensive but very uncertain prospects open up before us. It seems that, in those obscure centuries which are scarcely accessible to historical research, the countries round the eastern basin of the Mediterranean were the scene of frequent and violent volcanic eruptions, which must have made the strongest impression on their inhabitants. Evans assumes that the final destruction of the palace of Minos at Knossos too was the consequence of an earthquake. In Crete at that period (as probably in the Aegean world in general) the great mother-goddess was worshipped. The realization that she was not able to protect her house against the assaults of a stronger power may have contributed to her having to give place to a male deity, and, if so, the volcano god had the first claim to take her place. After all, Zeus always remains the 'earth-shaker'. There is little doubt that it was during those obscure ages that the mother-goddesses were replaced by male gods (who may originally perhaps have been sons). The destiny of Pallas Athene, who was no doubt the local form of the mother-goddess, is particularly impressive. She was reduced to being a daughter by the religious revolution, she was robbed of her own mother and, by having virginity imposed on her, was permanently excluded from motherhood.

The bringing-in of the patriarchs served yet another purpose. They had lived in Canaan, and their memory was linked with particular localities in that country. It is possible that they were themselves originally Canaanite heroes or local divinities, and were then seized on by the immigrant Israelites for their prehistory. By appealing to the patriarchs they were as it were asserting their indigenous character and defending themselves from the odium attaching to an alien conqueror. It was a clever twist to declare that the god Yahweh was only giving them back what their forefathers had once possessed.

In the later contributions to the text of the Bible the intention was put into effect of avoiding the mention of Kadesh. The place at which the religion was founded was fixed once and for all as the Mount of God, Sinai-Horeb. It is not easy to see the motive for this; perhaps people were unwilling to be reminded of the influence of Midian. But all later distortions, especially of the period of the Priestly Code, had another aim in view. There was no longer any need to alter accounts of events in a desired sense - for this had been done long before. But care was taken to shift back commands and institutions of the present day into early times - to base them, as a rule, on the Mosaic law-giving - so as to derive from this their claim to being holy and binding. However much the picture of the past might in this way be falsified, the procedure was not without a certain psychological justification. It reflected the fact that in the course of long ages - between the Exodus from Egypt and the fixing of the text of the Bible under Ezra and Nehemiah some eight hundred years elapsed - the Yahweh religion had had its form changed back into conformity, or even perhaps into identity, with the original religion of Moses.

And this is the essential outcome, the momentous substance, of the history of the Jewish religion.

(7)

Of all the events of early times which later poets, priests and historians undertook to work over, one stood out, the suppression of which was enjoined by the most immediate and best human motives. This was the murder of Moses, the great leader and liberator, which Sellin discovered from hints in the writings of the Prophets. Sellin's hypothesis cannot be called fantastic - it is probable enough. Moses, deriving from the school of Akhenaten, employed no methods other than did the king; he commanded, he forced his faith upon the people.¹ The doctrine of Moses may have been even harsher than that of his master. He had no need to retain the sun-god as a support: the school of On had no significance for his alien people. Moses, like Akhenaten, met with the same fate that awaits all enlightened despots. The Jewish people under Moses were just as little able to tolerate such a highly spiritualized religion and find satisfaction of their needs in what it had to offer as had been the Egyptians of the Eighteenth Dynasty. The same thing happened in both cases: those who had been dominated and kept in want rose and threw off the burden of the religion that had been imposed on them. But while the tame Egyptians waited till fate had removed the sacred figure of their Pharaoh, the savage Semites took fate into their own hands and rid themselves of their tyrant.²

¹ At that period any other method of influencing them was scarcely possible.

² It is really remarkable how little we hear in the thousands of years of Egyptian history of the violent removal or murder of a Pharaoh. A comparison with Assyrian history, for instance, must increase our surprise at this. It may, of course, be accounted for by the fact that Egyptian history was entirely written to serve official ends.

Nor can it be maintained that the surviving text of the Bible gives us no warning of such an end to Moses. The account of the 'wandering in the wilderness', which may stand for the period during which Moses ruled, describes a succession of serious revolts against his authority which were also, by Yahweh's command, suppressed with bloody punishment. It is easy to imagine that one such rebellion ended in a way different from what the text suggests. The people's defection from the new religion is also described in the text - only as an episode, it is true: namely in the story of the golden calf. In this, by an ingenious turn, the breaking of the tables of the law (which is to be understood symbolically: 'he has broken the law') is transposed on to Moses himself, and his furious indignation is assigned as its motive.

There came a time when people began to regret the murder of Moses and to seek to forget it. This was certainly so at the time of the union of the two portions of the people at Kadesh. But when the Exodus and the foundation of the religion at the oasis were brought closer together, and Moses was represented as being concerned in the latter instead of the other man, not only were the demands of the followers of Moses satisfied but the distressing fact of his violent end was successfully disavowed. In actual fact it is most unlikely that Moses could have taken part in the proceedings at Kadesh even if his life had not been cut short.

We must now make an attempt at elucidating the chronological relations of these events. We have put the Exodus in the period after the end of the Eighteenth Dynasty (1350 B.C.). It may have occurred then or a little later, since the Egyptian chroniclers have included the succeeding years of anarchy in the reign of Haremhab, which brought them to an end and lasted till 1315 B.C. The next (but also the only) fixed point for the chronology is afforded by the stela of Merenptah (1225-15 B.C.), which boasts of his victory over Isiraa (Israel) and the laying waste of her seed (?). The sense to be attached to this inscription is unfortunately doubtful, it is supposed to prove that the Israelite tribes were already at that time settled in Canaan.¹ Eduard Meyer rightly concludes from this stela that Merenptah cannot have been the Pharaoh of the Exodus, as had been lightly assumed previously. The date of the Exodus must have been earlier. The question of who was the Pharaoh of the Exodus seems to me altogether an idle one. There was no Pharaoh of the Exodus, for it occurred during an interregnum. Nor does the discovery of the stela of Merenptah throw any light on the possible date of the union and founding of the religion at Kadesh. All that we can say with certainty is that it was some time between 1350 and 1215 B.C. We suspect that the Exodus comes somewhere very near the beginning of this hundred years and the events at Kadesh not too far away from its end. We should like to claim the greater part of this period for the interval between the two occurrences. For we need a comparatively long time for the passions of the returning tribes to have cooled down after the murder of Moses and for the influence of his followers, the Levites, to have become as great as is implied by the compromise at Kadesh. Two generations, sixty years, might about suffice for this, but it is a tight fit. What is inferred from the stela of Merenptah comes too early for us, and since we recognize that in this hypothesis of ours one supposition is only based on another, we must admit that this discussion reveals a weak side of our construction. It is unlucky that everything relating to the settlement of the Jewish people in Canaan is so obscure and confused. Our only resort, perhaps, is to suppose that the name on the 'Israel' stela does not relate to the tribes whose fortunes we are trying to follow and which combined to form the later people of Israel. After all, the name of 'Habiru' (Hebrews) was transferred to these same people in the Amarna period.

¹ Eduard Meyer, 1906, 222 ff.

The union of the tribes into a nation through the adoption of a common religion, whenever it may have taken place, might easily have turned out quite an unimportant happening in world history. The new religion would have been carried away by the current of events, Yahweh would have had to take his place in the procession of departed gods in Flaubert's vision, and all twelve of his tribes would have been 'lost' and not only the ten of them which the Anglo-Saxons have been in search of for so long. The god Yahweh, to whom the Midianite Moses then presented a new people, was probably in no respect a prominent being. A coarse, narrow-minded, local god, violent and bloodthirsty, he had promised his followers to give them 'a land flowing with milk and honey' and urged them to exterminate its present inhabitants 'with the edge of the sword'. It is astonishing how much remains, in spite of all the revisions of the Biblical narratives, that allows us to recognize his original nature. It is not even certain that his religion was a genuine monotheism, that it denied the divinity of the deities of other peoples. It was enough probably that his people regarded their own god as more powerful than any foreign god. If, nevertheless, in the sequel everything took a different course from what such beginnings would have led one to expect, the cause can be found in only one fact. The Egyptian Moses had given to one portion of the people a more highly spiritualized notion of god, the idea of a single deity embracing the whole world, who was not less all-loving than all-powerful, who was averse to all ceremonial and magic and set before men as their highest aim a life in truth and justice. For, however incomplete may be the accounts we have of the ethical side of the Aten religion, it can be no unimportant fact that Akhenaten regularly referred to himself in his inscriptions as 'living in Ma'at' (truth, justice).¹ In the long run it made no difference that the people rejected the teaching of Moses (probably after a short time) and killed him himself. The *tradition* of it remained and its influence achieved (only gradually, it is true, in the course of centuries) what was denied to Moses himself. The god Yahweh had arrived at undeserved honour when, from the time of Kadesh onwards, he was credited with the deed of liberation which had been performed by Moses; but he had to pay heavily for this usurpation. The shadow of the god whose place he had taken became stronger than himself; by the end of the process of evolution, the nature of the forgotten god of Moses had come to light behind his own. No one can doubt that it was only the idea of this other god that enabled the people of Israel to survive all the blows of fate and that kept them alive to our own days.

¹ His hymns lay stress not only on the god's universality and oneness, but also on his loving care for all creatures; and they encourage joy in nature and enjoyment of its beauty. (Breasted, 1934.)

It is no longer possible to estimate the share taken by the Levites in the final victory of the Mosaic god over Yahweh. They had taken the side of Moses in the past, when the compromise was reached at Kadesh, in a still live memory of the master whose retinue and compatriots they had been. During the centuries since then they had become merged with the people or with the priesthood, and it had become the main function of the priests to develop and supervise the ritual, and besides this to preserve the holy writ and revise it in accordance with their aims. But was not all sacrifice and all ceremonial at bottom only magic and sorcery, such as had been unconditionally rejected by the old Mosaic teaching? Thereupon there arose from among the midst of the people an unending succession of men who were not linked to Moses in their origin but were enthralled by the great and mighty tradition which had grown up little by little in obscurity: and it was these men, the Prophets, who tirelessly preached the old Mosaic doctrine that the deity disdained sacrifice and ceremonial and asked only for faith and a life in truth and justice (Ma'at). The efforts of the Prophets had a lasting success; the doctrines with which they re-established the old faith became the permanent content of the Jewish religion. It is honour enough to the Jewish people that they could preserve such a tradition and produce men who gave it a voice - even though the initiative to it came from outside, from a great foreigner.

I should not feel secure in giving this account, if I could not appeal to the judgement of other enquirers with a specialist knowledge who see the significance of Moses for the Jewish religion in the same light as I do, even though they do not recognize his Egyptian origin. Thus, for instance, Sellin (1922, 52) writes: 'Consequently we must picture the true religion of Moses - his belief in the one moral God whom he preaches - as thenceforward necessarily the property of a small circle of the people. We must necessarily not expect to meet with it in the official cult, in the religion of the priests or in the beliefs of the people. We can necessarily only reckon to find an occasional spark emerging, now here and now there, from the spiritual torch which he once kindled, to find that his ideas have not entirely perished but have been silently at work here and there upon beliefs and customs, till sooner or later, through the effect of special experiences or of persons specially moved by his spirit, it has broken out more strongly once more and gained influence on wider masses of the population. It is from this point of view that the history of the ancient religion of Israel is necessarily to be regarded. Anyone who sought to construct the Mosaic religion on the lines of the religion we meet with, according to the chronicles, in the life of the people during their first five hundred years in Canaan, would be committing the gravest methodological error.' Volz (1907, 64) speaks even more clearly: it is his belief that 'the exalted work of Moses was understood and carried through to begin with only feebly and scantily, till, in the course of centuries, it penetrated more and more, and at length in the great Prophets it met with like spirits who continued the lonely man's work.'

And here, it seems, I have reached the conclusion of my study, which was directed to the single aim of introducing the figure of an Egyptian Moses into the nexus of Jewish history. Our findings may be thus expressed in the most concise formula. Jewish history is familiar to us for its dualities: *two* groups of people who came together to form the nation, *two* kingdoms into which this nation fell apart, *two* gods' names in the documentary sources of the Bible. To these we add two fresh ones: the foundation of *two* religions - the first repressed by the second but nevertheless later emerging victoriously behind it, and *two* religious founders, who are both called by the same name of Moses and whose personalities we have to distinguish from each other. All of these dualities are the necessary consequences of the first one: the fact that one portion of the people had an experience which must be regarded as traumatic and which the other portion escaped. Beyond this there would be a very great deal to discuss, to explain and to assert. Only thus would an interest in our purely historical study find its true justification. What the real nature of a tradition resides in, and what its special power rests on, how impossible it is to dispute the personal influence upon world-history of individual great men, what sacrilege one commits against the splendid diversity of human life if one recognizes only those motives which arise from material needs, from what sources some ideas (and particularly religious ones) derive their power to subject both men and peoples to their yoke - to study all this in the special case of Jewish history would be an alluring task. To continue my work on such lines as these would be to find a link with the statements I put forward twenty-five years ago in *Totem and Taboo*. But I no longer feel that I have the strength to do so.

III

MOSES, HIS PEOPLE AND MONOTHEIST RELIGION

PART I

PREFATORY NOTE I

(before March, 1938)

With the audacity of one who has little or nothing to lose, I propose for a second time to break a well-grounded intention and to add to my two essays on Moses in *Imago* the final portion which I have held back. I ended the last essay with an assertion that I knew my strength would not be enough for this. By that I meant, of course, the weakening of creative powers which goes along with old age;¹ but I was thinking of another obstacle as well.

We are living in a specially remarkable period. We find to our astonishment that progress has allied itself with barbarism. In Soviet Russia they have set about improving the living conditions of some hundred millions of people who were held firmly in subjection. They have been rash enough to withdraw the 'opium' of religion from them and have been wise enough to give them a reasonable amount of sexual liberty; but at the same time they have submitted them to the most cruel coercion and robbed them of any possibility of freedom of thought. With similar violence, the Italian people are being trained up to orderliness and a sense of duty. We feel it as a relief from an oppressive apprehension when we see in the case of the German people that a relapse into almost prehistoric barbarism can occur as well without being attached to any progressive ideas. In any case, things have so turned out that to-day the conservative democracies have become the guardians of cultural advance and that, strange to say, it is precisely the institution of the Catholic Church which puts up a powerful defence against the spread of this danger to civilization - the Church which has hitherto been the relentless foe to freedom of thought and to advances towards the discovery of the truth!

¹ I do not share the opinion of my contemporary Bernard Shaw, that human beings would only achieve anything good if they could live to be three hundred years old. A prolongation of life would achieve nothing unless many other fundamental changes were to be made in the conditions of life.

We are living here in a Catholic country under the protection of that Church, uncertain how long that protection will hold out. But so long as it lasts, we naturally hesitate to do anything that would be bound to arouse the Church's hostility. This is not cowardice, but prudence. The new enemy, to whom we want to avoid being of service, is more dangerous than the old one with whom we have already learnt to come to terms. The psycho-analytic researches which we carry on are in any case viewed with suspicious attention by Catholicism. I will not maintain that this is unjustly so. If our work leads us to a conclusion which reduces religion to a neurosis of humanity and explains its enormous power in the same way as a neurotic compulsion in our individual patients, we may be sure of drawing the resentment of our ruling powers down upon us. Not that I should have anything to say that would be new or that I did not say clearly a quarter of a century ago: but it has been forgotten in the meantime and it could not be without effect if I repeated it to-day and illustrated it from an example which offers a standard for all religious foundations. It would probably lead to our being prohibited from practising psycho-analysis. Such violent methods of suppression are, indeed, by no means alien to the Church; the fact is rather that it feels it as an invasion of its privileges if someone else makes use of those methods. But psycho-analysis, which in the course of my long life has gone everywhere, still possesses no home that could be more valuable for it than the city in which it was born and grew up.

I do not only think but I *know* that I shall let myself be deterred by this second obstacle, by the external danger, from publishing the last portion of my study on Moses. I have made yet another attempt to get the difficulty out of the way, by telling myself that my fears are based on an over-estimation of my own personal importance: that it will probably be a matter of complete indifference to the authorities what I choose to write about Moses and the origin of monotheist religions. But I feel uncertain in my judgement of this. It seems to me much more possible that malice and sensationalism will counter-balance any lack of recognition of me in the contemporary world's judgement. So I shall not give this work to the public. But that need not prevent my writing it. Especially as I have written it down already once, two years ago, so that I have only to revise it and attach it to the two essays that have preceded it. It may then be preserved in concealment till some day the time arrives when it may venture without danger into the light, or till someone who has reached the same conclusions and opinions can be told: 'there was someone in darker times who thought the same as you!'

PREFATORY NOTE II

(June, 1938)

The quite special difficulties which have weighed on me during my composition of this study relating to the figure of Moses - internal doubts as well as external obstacles - have resulted in this third and concluding essay being introduced by two different prefaces, which contradict each other and indeed cancel each other out. For in the short space of time between the two there has been a fundamental change in the author's circumstances. At the earlier date I was living under the protection of the Catholic Church, and was afraid that the publication of my work would result in the loss of that protection and would conjure up a prohibition upon the work of the adherents and students of psycho-analysis in Austria. Then, suddenly, came the German invasion and Catholicism proved, to use the words of the Bible, 'a broken reed'. In the certainty that I should now be persecuted not only for my line of thought but also for my 'race' - accompanied by many of my friends, I left the city which, from my early childhood, had been my home for seventy-eight years.

I met with the friendliest reception in lovely, free, magnanimous England. Here I now live, a welcome guest; I can breathe a sigh of relief now that the weight has been taken off me and that I am once more able to speak and write - I had almost said 'and think' - as I wish or as I must. I venture to bring the last portion of my work before the public.

There are no external obstacles remaining, or at least none to be frightened of. In the few weeks of my stay here I have received countless greetings from friends who were pleased at my arrival, and from unknown and indeed uninvolved strangers who only wanted to give expression to their satisfaction at my having found freedom and safety here. And in addition there arrived, with a frequency surprising to a foreigner, communications of another sort, which were concerned with the state of my soul, which pointed out to me the way of Christ and sought to enlighten me on the future of Israel. The good people who wrote in this way cannot have known much about me; but I expect that when this work about Moses becomes known, in a translation, among my new compatriots, I shall forfeit enough of the sympathy which a number of other people as well now feel for me.

As regards *internal* difficulties, a political revolution and a change of domicile could alter nothing. No less than before, I feel uncertain in the face of my own work; I lack the consciousness of unity and of belonging together which should exist between an author and his work. It is not as though there were an absence of conviction in the correctness of my conclusion. I acquired that a quarter of a century ago when in 1912 I wrote my book about *Totem and Taboo*, and it has only grown firmer since. From that time I have never doubted that religious phenomena are only to be understood on the pattern of the individual neurotic symptoms familiar to us - as the return of long since forgotten, important events in the *primaeval* history of the human family - and that they have to thank precisely this origin for their compulsive character and that, accordingly, they are effective on human beings by force of the historical truth of their content. My uncertainty sets in only when I ask myself whether I have succeeded in proving these theses in the example which I have chosen here of Jewish monotheism. To my critical sense this book, which takes its start from the man Moses, appears like a dancer balancing on the tip of one toe. If I could not find support in an analytic interpretation of the exposure myth and could not pass from there to Sellin's suspicion about the end of Moses, the whole thing would have had to remain unwritten. In any case, let us now take the plunge.

A

THE HISTORICAL PREMISS¹

Here, then, is the historical background of the events which have absorbed our interest. As a result of the conquests of the Eighteenth Dynasty, Egypt became a world-empire. The new imperialism was reflected in the development of the religious ideas, if not of the whole people, at least of its ruling and intellectually active upper stratum. Under the influence of the priests of the sun-god at On (Heliopolis), strengthened perhaps by impulses from Asia, the idea arose of a universal god Aten to whom restriction to a single country and a single people no longer applied. In the young Amenophis IV a Pharaoh came to the throne who had no higher interest than the development of this idea of a god. He promoted the religion of Aten into the state religion, and through him the universal god became the *only* god: everything that was told of other gods was deceit and lies. With magnificent inflexibility he resisted every temptation to magical thought, and he rejected the illusion, so dear to Egyptians in particular, of a life after death. In an astonishing presentiment of later scientific discovery he recognized in the energy of solar radiation the source of all life on earth and worshipped it as the symbol of the power of his god. He boasted of his joy in the creation and of his life in Ma'at (truth and justice).

This is the first and perhaps the clearest case of a monotheist religion in human history; a deeper insight into the historical and psychological determinants of its origin would be of immeasurable value. Care has however been taken that none too much information about the Aten religion should reach us. Already under Akhenaten's feeble successors all that he had created collapsed. The vengeance of the priesthood which he had suppressed raged against his memory; the Aten religion was abolished, the capital city of the Pharaoh, who was branded as a criminal, was destroyed and plundered. In about 1350 B.C. the Eighteenth Dynasty came to an end; after a period of anarchy, order was restored by general Haremhab, who reigned till 1315 B.C. Akhenaten's reform seemed to be an episode doomed to be forgotten.

¹ I begin with a *résumé* of the findings of my second study on Moses, the purely historical one. Those findings will not be submitted here to any fresh criticism, since they form the premiss to the psychological discussions which start out from them and constantly go back to them.

Thus far what is established historically; and now our hypothetical sequel begins. Among those in Akhenaten's *entourage* there was a man who was perhaps called Tuthmosis, like many other people at that time¹ - the name is not of great importance except that its second component must have been '-mose'. He was in a high position and a convinced adherent of the Aten religion, but, in contrast to the meditative king, he was energetic and passionate. For him the death of Akhenaten and the abolition of his religion meant the end of all his expectations. He could remain in Egypt only as an outlaw or as a renegade. Perhaps as governor of the frontier province he had come in contact with a Semitic tribe which had immigrated into it a few generations earlier. Under the necessity of his disappointment and loneliness he turned to these foreigners and with them sought compensation for his losses. He chose them as his people and tried to realize his ideals in them. After he had left Egypt with them, accompanied by his followers, he made them holy by the mark of circumcision, gave them laws and introduced them into the doctrines of the Aten religion, which the Egyptians had just thrown off. The precepts which this man Moses gave to his Jews may have been even harsher than those of his master and teacher Akhenaten, and he may, too, have given up dependence on the sun-god of On, to which Akhenaten had continued to adhere.

We must take the period of the interregnum after 1350 B.C. as the date of the Exodus from Egypt. The interval of time which followed, up to the completion of the occupation of the land of Canaan, is particularly inscrutable. Modern historical research has been able to extract two facts from the obscurity which the biblical narrative has left, or rather created, at this point. The first of these facts, discovered by Ernst Sellin, is that the Jews, who, even by the account in the Bible, were headstrong and unruly towards their law-giver and leader, rose against him one day, killed him and threw off the religion of the Aten which had been imposed on them, just as the Egyptians had thrown it off earlier. The second fact, demonstrated by Eduard Meyer, is that those Jews who had returned from Egypt united later on with closely related tribes in the region between Palestine, the Sinai Peninsula and Arabia, and that there, in a well-watered locality named Kadesh, under the influence of the Arabian Midianites, they took on a new religion, the worship of the volcano god Yahweh. Soon after this they were ready to invade Canaan as conquerors.

¹ Such as, for instance, the sculptor whose studio was found at Tell el-'Amarna.

The chronological relations of these two events to each other and to the Exodus from Egypt are very uncertain. The closest historical point of reference is provided by a stela of the Pharaoh Merenptah (who reigned till 1215 B.C.) which in the course of a report on campaigns in Syria and Palestine names 'Israel' among the defeated enemy. If we take the date of this stela as a *terminus ad quem*, we are left with about a century (from after 1350 to before 1215 B.C.) for the whole course of events, starting from the Exodus. It is possible, however, that the name 'Israel' did not yet relate to the tribes whose fortunes we are following and that in fact we have a longer interval at our disposal. The settlement in Canaan of what was later the Jewish people was certainly no rapidly completed conquest but took place in waves and over considerable periods of time. If we free ourselves from the limitation imposed by the Merenptah stela, we can all the more easily assign one generation (thirty years) to the period of Moses,¹ and allow at least two generations, but probably more, to elapse up to the time of the union at Kadesh.² The interval between Kadesh and the irruption into Canaan need only be short. The Jewish tradition, as was shown in the preceding essay, had good grounds for shortening the interval between the Exodus and the founding of the religion at Kadesh, while the reverse is in the interest of our account.

¹ This would correspond to the forty years of wandering in the wilderness of the Bible text.

² Thus we should have about 1350 (or 1340)-1320 (or 1310) B.C. for the Moses period; 1260 B.C., or preferably later, for Kadesh; the Merenptah stela before 1215 B.C.

All this, however, is still history, an attempt to fill up the gaps in our historical knowledge and in part a repetition of my second essay in *Imago*. Our interest follows the fortunes of Moses and of his doctrines, to which the rising of the Jews had only apparently put an end. From the account given by the Yahwist, which was written down in about 1000 B.C. but was certainly based on earlier records, we have discovered that the union and the founding of the religion at Kadesh were accompanied by a compromise in which the two sides are still easily distinguishable. The one partner was only concerned to disavow the novelty and foreign character of the god Yahweh and to increase his claim to the people's devotion; the other partner was anxious not to sacrifice to him precious memories of the liberation from Egypt and of the grand figure of the leader, Moses. The second side succeeded, too, in introducing both the fact and the man into the new account of prehistory, in retaining at least the external mark of the religion of Moses - circumcision - and possibly in establishing certain restrictions in the use of the name of the new god. As we have said, the representatives of these claims were the descendants of the followers of Moses, the Levites, who were separated from his contemporaries and compatriots by only a few generations and were still attached to his memory by a living recollection. The poetically embellished narrative which we attribute to the Yahwist, and to his later rival the Elohist, were like mausoleums beneath which, withdrawn from the knowledge of later generations, the true account of those early things - of the nature of the Mosaic religion and of the violent end of the great man - was, as it were, to find its eternal rest. And if we have guessed what happened correctly, there is nothing left about it that is puzzling; but it might very well have signified the final end of the Moses episode in the history of the Jewish people.

The remarkable thing, however, is that that was not the case - that the most powerful effects of the people's experience were to come to light only later and to force their way into reality in the course of many centuries. It is unlikely that Yahweh differed much in character from the gods of the surrounding peoples and tribes. It is true that he struggled with them, just as the peoples themselves fought with one another, but we cannot suppose that it came into the head of a Yahweh-worshipper of those days to deny the existence of the gods of Canaan or Moab or Amalek, and so on, any more than to deny the existence of the peoples who believed in them.

The monotheist idea, which had flared up with Akhenaten, had grown dark once more and was to remain in darkness for a long time to come. Finds in the island of Elephantine, just below the First Cataract of the Nile, have given us the surprising information that a Jewish military colony had been settled there for centuries, in whose temple, alongside of the chief god Yahu, two female deities were worshipped, one of them named Anat-Yahu. These Jews, it is true, were cut off from their mother-country and had not taken part in the religious development there; the Persian government of Egypt (of the fifth century B.C.) conveyed information to them of the new rules of worship issued from Jerusalem.¹ Going back to earlier times, we may say that the god Yahweh certainly bore no resemblance to the Mosaic god. Aten had been a pacifist like his representative on earth - or more properly, his prototype - the Pharaoh Akhenaten, who looked on passively while the world-empire conquered by his ancestors fell to pieces. No doubt Yahweh was better suited to a people who were starting out to occupy new homelands by force. And everything in the Mosaic god that deserved admiration was quite beyond the comprehension of the primitive masses.

I have already said - and on that point I have been glad to be able to claim agreement with other writers - that the central fact of the development of the Jewish religion was that in the course of time the god Yahweh lost his own characteristics and grew more and more to resemble the old god of Moses, the Aten. It is true that differences remained to which one would be inclined at a first glance to attribute great importance; but these can easily be explained.

In Egypt Aten had begun to dominate during a fortunate period of established possession, and even when the empire began to totter, his worshippers had been able to turn away from the disturbance and continued to praise and to enjoy his creations. The Jewish people were fated to experience a series of grave trials and painful events; their god became harsh and severe and, as it were, wrapped in gloom. He retained the characteristic of being a universal god, reigning over all countries and peoples, but the fact that his worship had passed over from the Egyptians to the Jews found expression in the additional belief that the Jews were his chosen people whose special obligations would eventually meet with a special reward as well. It may not have been easy for the people to reconcile a belief in being preferred by their omnipotent god with the sad experiences of their unfortunate destiny. But they did not allow themselves to be shaken in their convictions; they increased their own sense of guilt in order to stifle their doubts of God, and it may be that they pointed at last to the 'inscrutable decrees of Providence', as pious people do to this day. If they felt inclined to wonder at his allowing one violent aggressor after another to arise and overthrow and maltreat them - Assyrians, Babylonians, Persians - they could yet recognize his power in the fact that all these evil foes were themselves conquered in turn and that their empires vanished.

In three important respects the later god of the Jews became in the end like the old Mosaic god. The first and decisive point is that he was truly acknowledged as the only god, beside whom any other god was unthinkable. Akhenaten's monotheism was taken seriously by an entire people; indeed, that people clung so much to this idea that it became the main content of their intellectual life and left them no interest for other things. On this the people and the priesthood who had become dominant among them were at one. But whereas the priests exhausted their efforts in erecting the ceremonial for his worship, they came in opposition to intense currents among the people which sought to revive two others of the doctrines of Moses about his god. The voices of the Prophets never tired of declaring that God despised ceremonial and sacrifice and required only that people should believe in him and lead a life in truth and justice. And when they praised the simplicity and holiness of life in the wilderness they were certainly under the influence of the Mosaic ideals.

¹ Auerbach, 2, 1936.

It is time to raise the question of whether there is any need whatever to call in the influence of Moses as a cause of the final form taken by the Jewish idea of God, or whether it would not be enough to assume a spontaneous development to higher intellectuality during a cultural life extending over hundreds of years. There are two things to be said about this possible explanation which would put an end to all our puzzling conjectures. First, that it explains nothing. In the case of the Greeks - unquestionably a most highly gifted people - the same conditions did not lead to monotheism but to a disintegration of their polytheist religion and to the beginning of philosophical thought. In Egypt, so far as we can understand, monotheism grew up as a by-product of imperialism: God was a reflection of the Pharaoh who was the absolute ruler of a great world empire. With the Jews, political conditions were highly unfavourable for the development from the idea of an exclusive national god to that of a universal ruler of the world. And where did this tiny and powerless nation find the arrogance to declare itself the favourite child of the great Lord? The problem of the origin of monotheism among the Jews would thus remain unsolved, or we should have to be content with the common answer that it is the expression of the peculiar religious genius of that people. Genius is well known to be incomprehensible and irresponsible, and we ought therefore not to bring it up as an explanation till every other solution has failed us.¹

In addition to this, we come upon the fact that Jewish records and historical writings themselves point us the way, by asserting most definitely - this time without contradicting themselves - that the idea of a single god was brought to the people by Moses. If there is an objection to the trustworthiness of this assurance, it is that the priestly revision of the text we have before us obviously traces far too much back to Moses. Institutions such as the ritual ordinances, which date unmistakably from later times, are given out as Mosaic commandments with the plain intention of lending them authority. This certainly gives us ground for suspicion, but not enough for a rejection. For the deeper motive for an exaggeration of this kind is obvious. The priestly narrative seeks to establish continuity between its contemporary period and the remote Mosaic past; it seeks to disavow precisely what we have described as the most striking fact about Jewish religious history, namely that there is a yawning gap between the law-giving of Moses and the later Jewish religion - a gap which was at first filled by the worship of Yahweh, and was only slowly patched up afterwards. It disputes this course of events by every possible means, though its historical correctness is established beyond any doubt, since, in the particular treatment given to the Biblical text, superabundant evidence has been left to prove it. Here the priestly revision has attempted something similar to the tendentious distortion which made the new god Yahweh into the god of the Patriarchs. If we take this motive of the Priestly Code into account, we shall find it hard to withhold our belief from the assertion that Moses really did himself give the monotheist idea to the Jews. We should be all the readier to give our assent since we can say where Moses derived this idea from, which the Jewish priests certainly knew no longer.

¹ This same consideration applies, too, to the remarkable case of William Shakespeare of Stratford.

And here someone might ask what we gain by tracing Jewish to Egyptian monotheism. It merely pushes the problem a little way further back: it tells us nothing more of the genesis of the monotheist idea. The answer is that the question is not one of gain but of investigation. Perhaps we may learn something from it if we discover the real course of events.

B

THE LATENCY PERIOD AND TRADITION

We confess the belief, therefore, that the idea of a single god, as well as the rejection of magically effective ceremonial and the stress upon ethical demands made in his name, were in fact Mosaic doctrines, to which no attention was paid to begin with, but which, after a long interval had elapsed, came into operation and eventually became permanently established. How are we to explain a delayed effect of this kind and where do we meet with a similar phenomenon? It occurs to us at once that such things are not infrequently to be found in the most various spheres and that they probably come about in a number of ways which are understandable with greater or less ease. Let us take, for instance, the history of a new scientific theory, such as Darwin's theory of evolution. At first it met with embittered rejection and was violently disputed for decades; but it took no longer than a generation for it to be recognized as a great step forward towards truth. Darwin himself achieved the honour of a grave or cenotaph in Westminster Abbey. A case such as that leaves us little to unravel. The new truth awoke emotional resistances; these found expression in arguments by which the evidence in favour of the unpopular theory could be disputed; the struggle of opinions took up a certain length of time; from the first there were adherents and opponents; the number as well as the weight of the former kept on increasing till at last they gained the upper hand; during the whole time of the struggle the subject with which it was concerned was never forgotten. We are scarcely surprised that the whole course of events took a considerable length of time; and we probably do not sufficiently appreciate that what we are concerned with is a process in group psychology.

There is no difficulty in finding an analogy in the mental life of an individual corresponding precisely to this process. Such would be the case if a person learnt something new to him which, on the ground of certain evidence, he ought to recognize as true, but which contradicts some of his wishes and shocks a few convictions that are precious to him. Thereupon he will hesitate, seek for reasons to enable him to throw doubts on this new thing, and for a while will struggle with himself, till finally he admits to himself: 'All the same it *is* so, though it's not easy for me to accept it, though it's distressing to me to have to believe it.' What we learn from this is merely that it takes time for the reasoning activity of the ego to overcome the objections that are maintained by strong affective cathexes. The similarity between this case and the one we are endeavouring to understand is not very great.

The next example we turn to appears to have even less in common with our problem. It may happen that a man who has experienced some frightful accident - a railway collision, for instance - leaves the scene of the event apparently uninjured. In the course of the next few weeks, however, he develops a number of severe psychical and motor symptoms which can only be traced to his shock, the concussion or whatever else it was. He now has a 'traumatic neurosis'. It is a quite unintelligible - that is to say, a new - fact. The time that has passed between the accident and the first appearance of the symptoms is described as the 'incubation period', in a clear allusion to the pathology of infectious diseases. On reflection, it must strike us that, in spite of the fundamental difference between the two cases - the problem of traumatic neurosis and that of Jewish monotheism - there is nevertheless one point of agreement: namely, in the characteristic that might be described as 'latency'. According to our assured hypothesis, in the history of the Jewish religion there was a long period after the defection from the religion of Moses during which no sign was to be detected of the monotheist idea, of the contempt for ceremonial or of the great emphasis on ethics. We are thus prepared for the possibility that the solution of our problem is to be looked for in a particular psychological situation.

We have already repeatedly described what happened at Kadesh when the two portions of what was later to be the Jewish people came together to receive a new religion. In those, on the one hand, who had been in Egypt, memories of the Exodus and of the figure of Moses were still so strong and vivid that they demanded their inclusion in an account of early times. They were grandchildren, perhaps, of people who had known Moses himself, and some of them still felt themselves Egyptians and bore Egyptian names. But they had good motives for repressing the memory of the fate with which their leader and lawgiver had met. The determining purpose of the other portion of the people was to glorify the new god and to dispute his being foreign. Both portions had the same interest in disavowing the fact of their having had an earlier religion and the nature of its content. So it was that the first compromise came about, and it was probably soon recorded in writing. The people who had come from Egypt had brought writing and the desire to write history along with them; but it was to be a long time before historical writing realized that it was pledged to unswerving truthfulness. To begin with it had no scruples about shaping its narratives according to the needs and purposes of the moment, as though it had not yet recognized the concept of falsification. As a result of these circumstances a discrepancy was able to grow up between the written record and the oral transmission of the same material - *tradition*. What had been omitted or changed in the written record might very well have been preserved intact in tradition. Tradition was a supplement but at the same time a contradiction to historical writing. It was less subjected to the influence of distorting purposes and perhaps at some points quite exempt from them, and it might therefore be more truthful than the account that had been recorded in writing. Its trustworthiness, however, suffered from the fact that it was less stable and definite than the written account and exposed to numerous changes and alterations when it was handed on from one generation to another by oral communication. A tradition of such a kind might meet with various sorts of fate. What we should most expect would be that it would be crushed by the written account, would be unable to stand up against it, would become more and more shadowy and would finally pass into oblivion. But it might meet with other fates: one of these would be that the tradition itself would end in a written record, and we shall have to deal with yet others as we proceed.

The phenomenon of latency in the history of the Jewish religion, with which we are dealing, may be explained, then, by the circumstance that the facts and ideas which were intentionally disavowed by what may be called the official historians were in fact never lost. Information about them persisted in traditions which survived among the people. As we are assured by Sellin, indeed, there was actually a tradition about the end of Moses which flatly contradicted the official account and was far nearer the truth. The same, we may assume, also applied to other things which apparently ceased to exist at the same time as Moses - to some of the contents of the Mosaic religion, which had been unacceptable to the majority of his contemporaries.

The remarkable fact with which we are here confronted is, however, that these traditions, instead of becoming weaker with time, became more and more powerful in the course of centuries, forced their way into the later revisions of the official accounts and finally showed themselves strong enough to have a decisive influence on the thoughts and actions of the people. The determinants which made this outcome possible are for the moment, it is true, outside our knowledge.

This fact is so remarkable that we feel justified in looking at it once again. Our problem is comprised in it. The Jewish people had abandoned the Aten religion brought to them by Moses and had turned to the worship of another god who differed little from the Baalim of the neighbouring peoples. All the tendentious efforts of later times failed to disguise this shameful fact. But the Mosaic religion had not vanished without leaving a trace; some sort of memory of it had kept alive - a possibly obscured and distorted tradition. And it was this tradition of a great past which continued to operate (from the background, as it were), which gradually acquired more and more power over people's minds and which in the end succeeded in changing the god Yahweh into the Mosaic god and in re-awakening into life the religion of Moses that had been introduced and then abandoned long centuries before. That a tradition thus sunk in oblivion should exercise such a powerful effect on the mental life of a people is an unfamiliar idea to us. We find ourselves here in the field of group psychology, where we do not feel at home. We shall look about for analogies, for facts that are at least of a similar nature, even though in different fields. And facts of that sort are, I believe, to be found.

During the period at which, among the Jews, the return of the religion of Moses was in preparation, the Greek people found themselves in possession of an exceedingly rich store of tribal legends and hero-myths. It is believed that the ninth or eighth century B.C. saw the origin of the two Homeric epics, which drew their material from this circle of legends. With our present psychological insight we could, long before Schliemann and Evans, have raised the question of where it was that the Greeks obtained all the legendary material which was worked over by Homer and the great Attic dramatists in their masterpieces. The answer would have had to be that this people had probably experienced in their prehistory a period of external brilliance and cultural efflorescence which had perished in a historical catastrophe and of which an obscure tradition survived in these legends. The archaeological researches of our days have now confirmed this suspicion, which in the past would certainly have been pronounced too daring. These researches have uncovered the evidences of the impressive Minoan-Mycenaean civilization, which had probably already come to an end on the mainland of Greece before 1250 B.C. There is scarcely a hint at it to be found in the Greek historians of a later age: at most a remark that there was a time when the Cretans exercised command of the sea, and the name of King Minos and of his palace, the Labyrinth. That is all, and beyond it nothing has remained but the traditions which were seized on by the poets.

National epics of other peoples - Germans, Indians, Finns - have come to light as well. It is the business of historians of literature to investigate whether we may assume the same determinants for their origin as with the Greeks. Such an investigation would, I believe, yield a positive result. Here is the determinant which we recognize: a piece of prehistory which, immediately after it, would have been bound to appear rich in content, important, splendid, and always, perhaps, heroic, but which lies so far back, in such remote times, that only an obscure and incomplete tradition informs later generations of it. Surprise has been felt that the epic as an art-form has become extinct in later times. The explanation may be that its determining cause no longer exists. The old material was used up and for all later events historical writing took the place of tradition. The greatest heroic deeds of our days have not been able to inspire an epic, and even Alexander the Great had a right to complain that he would find no Homer.

Long-past ages have a great and often puzzling attraction for men's imagination. Whenever they are dissatisfied with their present surroundings - and this happens often enough - they turn back to the past and hope that they will now be able to prove the truth of the unextinguishable dream of a golden age.¹ They are probably still under the spell of their childhood, which is presented to them by their not impartial memory as a time of uninterrupted bliss.

If all that is left of the past are the incomplete and blurred memories which we call tradition, this offers an artist a peculiar attraction, for in that case he is free to fill in the gaps in memory according to the desires of his imagination and to picture the period which he wishes to reproduce according to his intentions. One might almost say that the vaguer a tradition has become the more serviceable it becomes for a poet. We need not therefore be surprised at the importance of tradition for imaginative writing, and the analogy with the manner in which epics are determined will make us more inclined to accept the strange hypothesis that it was the tradition of Moses which, for the Jews, altered the worship of Yahweh in the direction of the old Mosaic religion. But in other respects the two cases are still too different. On the one hand the outcome is a poem and on the other a religion; and in the latter instance we have assumed that, under the spur of tradition, it was reproduced with a faithfulness for which the instance of the epic can of course offer no counterpart. Accordingly enough of our problem is left over to justify a need for more apposite analogies.

¹ This was the situation on which Macaulay based his *Lays of Ancient Rome*. He put himself in the place of a minstrel who, depressed by the confused party strife of his own day, presented his hearers with the self-sacrifice, the unity and the patriotism of their ancestors.

C

THE ANALOGY

The only satisfying analogy to the remarkable course of events that we have found in the history of the Jewish religion lies in an apparently remote field; but it is very complete, and approaches identity. In it we once more come upon the phenomenon of latency, the emergence of unintelligible manifestations calling for an explanation and an early, and later forgotten, event as a necessary determinant. We also find the characteristic of compulsion, which forces itself on the mind along with an overpowering of logical thought - a feature which did not come into account, for instance, in the genesis of the epic.

This analogy is met with in psychopathology, in the genesis of human neuroses - in a field, that is to say, belonging to the psychology of individuals, while religious phenomena have of course to be reckoned as part of group psychology. We shall see that this analogy is not so surprising as might at first be thought - indeed that it is more like a postulate.

We give the name of *traumas* to those impressions, experienced early and later forgotten, to which we attach such great importance in the aetiology of the neuroses. We may leave on one side the question of whether the aetiology of the neuroses in general may be regarded as traumatic. The obvious objection to this is that it is not possible in every case to discover a manifest trauma in the neurotic subject's earliest history. We must often resign ourselves to saying that all we have before us is an unusual, abnormal reaction to experiences and demands which affect everyone, but are worked over and dealt with by other people in another manner which may be called normal. When we have nothing else at our disposal for explaining a neurosis but hereditary and constitutional dispositions, we are naturally tempted to say that it was not acquired but developed.

But in this connection two points must be stressed. Firstly, the genesis of a neurosis invariably goes back to very early impressions in childhood.¹ Secondly, it is true that there are cases which are distinguished as being 'traumatic' because their effects go back unmistakably to one or more powerful impressions in these early times - impressions which have escaped being dealt with normally, so that one is inclined to judge that if they had not occurred the neurosis would not have come about either. It would be enough for our purposes if we were obliged to restrict the analogy we are in search of to these traumatic cases. But the gap between the two groups appears not to be unbridgeable. It is quite possible to unite the two aetiological determinants under a single conception; it is merely a question of how one defines 'traumatic'. If we may assume that the experience acquires its traumatic character only as a result of a quantitative factor - that is to say, that in every case it is an excess in demand that is responsible for an experience evoking unusual pathological reactions - then we can easily arrive at the expedient of saying that something acts as a trauma in the case of one constitution but in the case of another would have no such effect. In this way we reach the concept of a sliding 'complemental series' as it is called, in which two factors converge in fulfilling an aetiological requirement. A less of one factor is balanced by a more of the other; as a rule both factors operate together and it is only at the two ends of the series that there can be any question of a simple motive being at work. After mentioning this, we can disregard the distinction between traumatic and non-traumatic aetiologies as irrelevant to the analogy we are in search of.

In spite of a risk of repetition, it will perhaps be as well to bring together here the facts which comprise the analogy that is significant for us. They are as follows. Our researches have shown that what we call the phenomena (symptoms) of a neurosis are the result of certain experiences and impressions which for that very reason we regard as aetiological traumas. We now have two tasks before us: to discover (1) the common characteristics of these experiences and (2) those of neurotic symptoms, and in doing so we need not avoid drawing a somewhat schematic picture.

¹ This therefore makes it nonsensical to say that one is practising psycho-analysis if one excludes from examination and consideration precisely these earliest periods - as happens in some quarters.

(1) (a) All these traumas occur in early childhood up to about the fifth year. Impressions from the time at which a child is beginning to talk stand out as being of particular interest; the periods between the ages of two and four seem to be the most important; it cannot be determined with certainty how long after birth this period of receptivity begins. (b) The experiences in question are as a rule totally forgotten, they are not accessible to memory and fall within the period of infantile amnesia, which is usually broken into by a few separate mnemonic residues, what are known as 'screen memories'. (c) They relate to impressions of a sexual and aggressive nature, and no doubt also to early injuries to the ego (narcissistic mortifications). In this connection it should be remarked that such young children make no sharp distinction between sexual and aggressive acts, as they do later. (Cf. the misunderstanding of the sexual act in a sadistic sense.) The predominance of the sexual factor is, of course, most striking and calls for theoretical consideration.

These three points - the very early appearance of these experiences (during the first five years of life), the fact of their being forgotten and their sexual-aggressive content - are closely interconnected. The traumas are either experiences on the subject's own body or sense perceptions, mostly of something seen and heard - that is, experiences or impressions. The interconnection of these three points is established by a theory, a product of the work of analysis which alone can bring about a knowledge of the forgotten experiences, or, to put it more vividly but also more incorrectly, bring them back to memory. The theory is that, in contrast to popular opinion, the sexual life of human beings (or what corresponds to it later on) exhibits an early efflorescence which comes to an end at about the fifth year and is followed by what is known as the period of latency (till puberty) in which there is no further development of sexuality and indeed what has been attained undergoes a retrogression. This theory is confirmed by the anatomical investigation of the growth of the internal genitalia; it leads us to suppose that the human race is descended from a species of animal which reached sexual maturity in five years and rouses a suspicion that the postponement of sexual life and its diphasic onset are intimately connected with the history of hominization. Human beings appear to be the only animal organisms with a latency period and sexual retardation of this kind. Investigations on the primates (which, so far as I know, are not available) would be indispensable for testing this theory. It cannot be a matter of indifference psychologically that the period of infantile amnesia coincides with this early period of sexuality. It may be that this state of things provides the true determinant for the possibility of neurosis, which is in a sense a human prerogative and from this point of view appears as a vestige - a 'survival' - of primaeval times like certain portions of our bodily anatomy.

(2) Two points must be stressed in regard to the common characteristics or peculiarities of neurotic phenomena: (a) The effects of traumas are of two kinds, positive and negative. The former are attempts to bring the trauma into operation once again - that is, to remember the forgotten experience or, better still, to make it real, to experience a repetition of it anew, or, even if it was only an early emotional relationship, to revive it in an analogous relationship with someone else. We summarize these efforts under the name of 'fixations' to the trauma and as a 'compulsion to repeat'. They may be taken up into what passes as a normal ego and, as permanent trends in it, may lend it unalterable character-traits, although, or rather precisely because, their true basis and historical origin are forgotten. Thus a man who has spent his childhood in an excessive and to-day forgotten attachment to his mother, may spend his whole life looking for a wife on whom he can make himself dependent and by whom he can arrange to be nourished and supported. A girl who was made the object of a sexual seduction in her early childhood may direct her later sexual life so as constantly to provoke similar attacks. It may easily be guessed that from such discoveries about the problem of neurosis we can penetrate to an understanding of the formation of character in general.

The negative reactions follow the opposite aim: that nothing of the forgotten traumas shall be remembered and nothing repeated. We can summarize them as 'defensive reactions'. Their principal expression are what are called 'avoidances', which may be intensified into 'inhibitions' and 'phobias'. These negative reactions too make the most powerful contributions to the stamping of character. Fundamentally they are just as much fixations to the trauma as their opposites, except that they are fixations with a contrary purpose. The symptoms of neurosis in the narrower sense are compromises in which both the trends proceeding from traumas come together, so that the share, now of one and now of the other tendency, finds preponderant expression in them. This opposition between the reactions sets up conflicts which in the ordinary course of events can reach no conclusion.

(b) All these phenomena, the symptoms as well as the restrictions on the ego and the stable character-changes, have a *compulsive* quality: that is to say that they have great psychical intensity and at the same time exhibit a far-reaching independence of the organization of the other mental processes, which are adjusted to the demands of the real external world and obey the laws of logical thinking. They are insufficiently or not at all influenced by external reality, pay no attention to it or to its psychical representatives, so that they may easily come into active opposition to both of them. They are, one might say, a State within a State, an inaccessible party, with which co-operation is impossible, but which may succeed in overcoming what is known as the normal party and forcing it into its service. If this happens, it implies a domination by an internal psychical reality over the reality of the external world and the path to a psychosis lies open. Even if things do not go so far, the practical importance of this situation can scarcely be overestimated. The inhibition upon the life of those who are dominated by a neurosis and their incapacity for living constitute a most important factor in a human society and we may recognize in their condition a direct expression of their fixation to an early portion of their past.

And now let us enquire about latency, which, in view of the analogy, is bound to interest us especially. A trauma in childhood may be followed immediately by a neurotic outbreak, an infantile neurosis, with an abundance of efforts at defence, and accompanied by the formation of symptoms. This neurosis may last a considerable time and cause marked disturbances, but it may also run a latent course and be overlooked. As a rule defence retains the upper hand in it; in any case alterations of the ego, comparable to scars, are left behind. It is only rarely that an infantile neurosis continues without interruption into an adult one. Far more often it is succeeded by a period of apparently undisturbed development - a course of things which is supported or made possible by the intervention of the physiological period of latency. Not until later does the change take place with which the definitive neurosis becomes manifest as a belated effect of the trauma. This occurs either at the irruption of puberty or some while later. In the former case it happens because the instincts, intensified by physical maturation, are able now to take up the struggle again in which they were at first defeated by the defence. In the latter case it happens because the reactions and alterations of the ego brought about by the defence now prove a hindrance in dealing with the new tasks of life, so that severe conflicts come about between the demands of the real external world and the ego, which seeks to maintain the organization which it has painstakingly achieved in its defensive struggle. The phenomenon of a latency of the neurosis between the first reactions to the trauma and the later outbreak of the illness must be regarded as typical. This latter illness may also be looked upon as an attempt at cure - as an effort once more to reconcile with the rest those portions of the ego that have been split off by the influence of the trauma and to unite them into a powerful whole *vis-à-vis* the external world. An attempt of this kind seldom succeeds, however, unless the work of analysis comes to its help, and even then not always; it ends often enough in a complete devastation or fragmentation of the ego or in its being overwhelmed by the portion which was early split off and which is dominated by the trauma.

In order to convince the reader, it would be necessary to give detailed reports of the life histories of numerous neurotics. But in view of the diffuseness and difficulty of the topic, this would completely destroy the character of the present work. It would turn into a monograph on the theory of the neuroses and even so would probably only have an effect on that minority of readers who have chosen the study and practice of psycho-analysis as their life-work. Since I am addressing myself here to a wider audience, I can only beg the reader to grant a certain provisional credence to the abridged account I have given above; and this must be accompanied by an admission on my part that the implications to which I am now leading him need only be accepted if the theories on which they are based turn out to be correct.

Nevertheless, I can attempt to tell the story of a single case which exhibits with special clarity some of the characteristics of a neurosis which I have mentioned. We must not expect, of course, that a single case will show everything and we need not feel disappointed if its subject-matter is far removed from the topic for which we are seeking an analogy.

A little boy, who, as is so often the case in middle-class families, shared his parents' bedroom during the first years of his life, had repeated, and indeed regular, opportunities of observing sexual acts between his parents - of seeing some things and hearing still more - at an age when he had scarcely learnt to speak. In his later neurosis, which broke out immediately after his first spontaneous emission, the earliest and most troublesome symptom was a disturbance of sleep. He was extraordinarily sensitive to noises at night and, once he was woken up, was unable to go to sleep again. This disturbance of sleep was a true compromise-symptom. On the one hand it was an expression of his defence against the things he had experienced at night, and on the other an attempt to re-establish the waking state in which he was able to listen to those impressions.

The child was aroused prematurely by observations of this kind to an aggressive masculinity and began to excite his little penis with his hand and to attempt various sexual attacks on his mother, thus identifying himself with his father, in whose place he was putting himself. This went on until at last his mother forbade him to touch his penis and further threatened that she would tell his father, who would punish him by taking his sinful organ away. This threat of castration had an extraordinarily powerful traumatic effect on the boy. He gave up his sexual activity and altered his character. Instead of identifying himself with his father, he was afraid of him, adopted a passive attitude to him and, by occasional naughtinesses, provoked him into administering corporal punishment; this had a sexual meaning for him, so that he was thus able to identify himself with his ill-treated mother. He clung to his mother herself more and more anxiously, as though he could not do without her love for a single moment, since he saw in it a protection against the danger of castration which threatened him from his father. In this modification of the Oedipus complex he passed his latency period, which was free from any marked disturbances. He became an exemplary boy and was quite successful at school.

So far we have followed the immediate effect of the trauma and have confirmed the fact of latency.

The arrival of puberty brought with it the manifest neurosis and disclosed its second main symptom - sexual impotence. He had forfeited the sensitivity of his penis, did not attempt to touch it, did not venture to approach a woman for sexual purposes. His sexual activity remained limited to psychical masturbation accompanied by sadistic-masochistic phantasies in which it was not hard to recognize off-shoots of his early observations of intercourse between his parents. The wave of intensified masculinity which puberty brought along with it was employed in furious hatred of his father and insubordination to him. This extreme relation to his father, reckless to the pitch of self-destruction, was responsible as well for his failure in life and his conflicts with the external world. He must be a failure in his profession because his father had forced him into it. Nor did he make any friends and he was never on good terms with his superiors.

When, burdened by these symptoms and incapacities, he at last, after his father's death, had found a wife, there emerged in him, as though they were the core of his being, character-traits which made contact with him a hard task for those about him. He developed a completely egoistic, despotic, and brutal personality, which clearly felt a need to suppress and insult other people. It was a faithful copy of his father as he had formed a picture of him in his memory: that is to say, a revival of the identification with his father which in the past he had taken on as a little boy from sexual motives. In this part of the story we recognize the *return* of the repressed, which (along with the immediate effects of the trauma and the phenomenon of latency) we have described as among the essential features of a neurosis.

D

APPLICATION

Early trauma - defence - latency - outbreak of neurotic illness - partial return of the repressed. Such is the formula which we have laid down for the development of a neurosis. The reader is now invited to take the step of supposing that something occurred in the life of the human species similar to what occurs in the life of individuals: of supposing, that is, that here too events occurred of a sexually aggressive nature, which left behind them permanent consequences but were for the most part fended off and forgotten, and which after a long latency came into effect and created phenomena similar to symptoms in their structure and purpose.

We believe that we can guess these events and we propose to show that their symptom-like consequences are the phenomena of religion. Since the emergence of the idea of evolution no longer leaves room for doubt that the human race has a prehistory, and since this is unknown - that is, forgotten - a conclusion of this kind almost carries the weight of a postulate. When we learn that in both cases the operative and forgotten traumas relate to life in the human family, we can greet this as a highly welcome, unforeseen bonus which has not been called for by our discussions up to this point.

I put forward these assertions as much as a quarter of a century ago in my *Totem and Taboo* (1912-13) and I need only repeat them here. My construction starts out from a statement of Darwin's and takes in a hypothesis of Atkinson's. It asserts that in primaeval times primitive man lived in small hordes, each under the domination of a powerful male. No date can be assigned to this, nor has it been synchronized with the geological epochs known to us: it is probable that these human creatures had not advanced far in the development of speech. An essential part of the construction is the hypothesis that the events I am about to describe occurred to all primitive men - that is, to all our ancestors. The story is told in an enormously condensed form, as though it had happened on a single occasion, while in fact it covered thousands of years and was repeated countless times during that long period. The strong male was lord and father of the entire horde and unrestricted in his power, which he exercised with violence. All the females were his property - wives and daughters of his own horde and some, perhaps, robbed from other hordes. The lot of his sons was a hard one: if they roused their father's jealousy they were killed or castrated or driven out. Their only resource was to collect together in small communities, to get themselves wives by robbery, and, when one or other of them could succeed in it, to raise themselves into a position similar to their father's in the primal horde. For natural reasons, youngest sons occupied an exceptional position. They were protected by their mother's love, and were able to take advantage of their father's increasing age and succeed him on his death. We seem to detect echoes in legends and fairy tales both of the expulsion of elder sons and of the favouring of youngest sons.

The first decisive step towards a change in this sort of 'social' organization seems to have been that the expelled brothers, living in a community, united to overpower their father and, as was the custom in those days, devoured him raw. There is no need to balk at this cannibalism; it continued far into later times. The essential point, however, is that we attribute the same emotional attitudes to these primitive men that we are able to establish by analytic investigation in the primitives of the present day - in our children. We suppose, that is, that they not only hated and feared their father but also honoured him as a model, and that each of them wished to take his place in reality. We can, if so, understand the cannibalistic act as an attempt to ensure identification with him by incorporating a piece of him.

It must be supposed that after the parricide a considerable time elapsed during which the brothers disputed with one another for their father's heritage, which each of them wanted for himself alone. A realization of the dangers and uselessness of these struggles, a recollection of the act of liberation which they had accomplished together, and the emotional ties with one another which had arisen during the period of their expulsion, led at last to an agreement among them, a sort of social contract. The first form of a social organization came about with a *renunciation of instinct*, a recognition of mutual *obligations*, the introduction of definite *institutions*, pronounced inviolable (holy) - that is to say, the beginnings of morality and justice. Each individual renounced his ideal of acquiring his father's position for himself and of possessing his mother and sisters. Thus the *taboo on incest* and the injunction to *exogamy* came about. A fair amount of the absolute power liberated by the removal of the father passed over to the women; there came a period of *matriarchy*. Recollection of their father persisted at this period of the 'fraternal alliance'. A powerful animal - at first, perhaps, always one that was feared as well - was chosen as a substitute for the father. A choice of this kind may seem strange, but the gulf which men established later between themselves and animals did not exist for primitive peoples; nor does it exist for our children, whose animal phobias we have been able to understand as fear of their father. In relation to the totem animal the original dichotomy in the emotional relation to the father (ambivalence) was wholly retained. On the one hand the totem was regarded as the clan's blood ancestor and protective spirit, who must be worshipped and protected, and on the other hand a festival was appointed at which the same fate was prepared for him that the primal father had met with. He was killed and devoured by all the tribesmen in common. (The totem meal, according to Robertson Smith.) This great festival was in fact a triumphant celebration of the combined sons' victory over their father.

What is the place of religion in this connection? I think we are completely justified in regarding totemism, with its worship of a father-substitute, with its ambivalence as shown by the totem meal, with its institution of memorial festivals and of prohibitions whose infringement was punished by death - we are justified, I say, in regarding totemism as the first form in which religion was manifested in human history and in confirming the fact of its having been linked from the first with social regulations and moral obligations. Here we can only give the most summary survey of the further developments of religion. They no doubt proceeded in parallel with the cultural advances of the human race and with the changes in the structure of human communities.

The first step away from totemism was the humanizing of the being who was worshipped. In place of the animals, human gods appear, whose derivation from the totem is not concealed. The god is still represented either in the form of an animal or at least with an animal's face, or the totem becomes the god's favourite companion, inseparable from him, or legend tells us that the god slew this precise animal, which was after all only a preliminary stage of himself. At a point in this evolution which is not easily determined great mother-goddesses appeared, probably even before the male gods, and afterwards persisted for a long time beside them. In the meantime a great social revolution had occurred. Matriarchy was succeeded by the re-establishment of a patriarchal order. The new fathers, it is true, never achieved the omnipotence of the primal father; there were many of them, who lived together in associations larger than the horde had been. They were obliged to be on good terms with one another, and remained under the limitation of social ordinances. It is likely that the mother-goddesses originated at the time of the curtailment of the matriarchy, as a compensation for the slight upon the mothers. The male deities appear first as sons beside the great mothers and only later clearly assume the features of father-figures. These male gods of polytheism reflect the conditions during the patriarchal age. They are numerous, mutually restrictive, and are occasionally subordinated to a superior high god. The next step, however, leads us to the theme with which we are here concerned - to the return of a single father-god of unlimited dominion.

It must be admitted that this historical survey has gaps in it and is uncertain at some points. But anyone who is inclined to pronounce our construction of *primaeval* history purely imaginary would be gravely underestimating the wealth and evidential value of the material contained in it. Large portions of the past, which have been linked together here into a whole, are historically attested: totemism and the male confederacies, for instance. Other portions have survived in excellent replicas. Thus authorities have often been struck by the faithful way in which the sense and content of the old totem meal is repeated in the rite of the Christian Communion, in which the believer incorporates the blood and flesh of his god in symbolic form. Numerous relics of the forgotten *primaeval* age have survived in popular legends and fairy tales, and the analytic study of the mental life of children has provided an unexpected wealth of material for filling the gaps in our knowledge of the earliest times. As contributions to our understanding of the son's relation to the father which is of such great importance, I need only bring forward animal phobias, the fear, which strikes us as so strange, of being eaten by the father, and the enormous intensity of the dread of being castrated. There is nothing wholly fabricated in our construction, nothing which could not be supported on solid foundations.

If our account of *primaeval* history is accepted as on the whole worthy of belief, two sorts of elements will be recognized in religious doctrines and rituals: on the one hand fixations to the ancient history of the family and survivals of it, and on the other hand revivals of the past and returns, after long intervals, of what has been forgotten. It is this last portion which, hitherto overlooked and therefore not understood, is to be demonstrated here in at least one impressive instance.

It is worth specially stressing the fact that each portion which returns from oblivion asserts itself with peculiar force, exercises an incomparably powerful influence on people in the mass, and raises an irresistible claim to truth against which logical objections remain powerless: a kind of '*credo quia absurdum*'. This remarkable feature can only be understood on the pattern of the delusions of psychotics. We have long understood that a portion of forgotten truth lies hidden in delusional ideas, that when this returns it has to put up with distortions and misunderstandings, and that the compulsive conviction which attaches to the delusion arises from this core of truth and spreads out on to the errors that wrap it round. We must grant an ingredient such as this of what may be called *historical* truth to the dogmas of religion as well, which, it is true, bear the character of psychotic symptoms but which, as group phenomena, escape the curse of isolation.

No other portion of the history of religion has become so clear to us as the introduction of monotheism into Judaism and its continuation in Christianity - if we leave on one side the development which we can trace no less uninterruptedly, from the animal totem to the human god with his regular companions. (Each of the four Christian evangelists still has his own favourite animal.) If we provisionally accept the world-empire of the Pharaohs as the determining cause of the emergence of the monotheist idea, we see that that idea, released from its native soil and transferred to another people was, after a long period of latency, taken hold of by them, preserved by them as a precious possession and, in turn, itself kept them alive by giving them pride in being a chosen people: it was the religion of their primal father to which were attached their hope of reward, of distinction and finally of world-dominion. This last wishful phantasy, long abandoned by the Jewish people, still survives among that people's enemies in a belief in a conspiracy by the 'Elders of Zion'. We reserve for discussion in later pages how the special peculiarities of the monotheist religion borrowed from Egypt affected the Jewish people and how it was bound to leave a permanent imprint on their character through its rejection of magic and mysticism, its invitation to advances in intellectuality and its encouragement of sublimations; how the people, enraptured by the possession of the truth, overwhelmed by the consciousness of being chosen, came to have a high opinion of what is intellectual and to lay stress on what is moral; and how their melancholy destinies and their disappointments in reality served only to intensify all these trends. For the moment we will follow their development in another direction.

The re-establishment of the primal father in his historic rights was a great step forward but it could not be the end. The other portions of the prehistoric tragedy insisted on being recognized. It is not easy to discern what set this process in motion. It appears as though a growing sense of guilt had taken hold of the Jewish people, or perhaps of the whole civilized world of the time, as a precursor to the return of the repressed material. Till at last one of these Jewish people found, in justifying a politico-religious agitator, the occasion for detaching a new - the Christian - religion from Judaism. Paul, a Roman Jew from Tarsus, seized upon this sense of guilt and traced it back correctly to its original source. He called this the 'original sin'; it was a crime against God and could only be atoned for by death. With the original sin death came into the world. In fact this crime deserving death had been the murder of the primal father who was later deified. But the murder was not remembered: instead of it there was a phantasy of its atonement, and for that reason this phantasy could be hailed as a message of redemption (*evangelium*). A son of God had allowed himself to be killed without guilt and had thus taken on himself the guilt of all men. It had to be a son, since it had been the murder of a father. It is probable that traditions from oriental and Greek mysteries had had an influence on the phantasy of redemption. What was essential in it seems to have been Paul's own contribution. In the most proper sense he was a man of an innately religious disposition: the dark traces of the past lurked in his mind, ready to break through into its more conscious regions.

That the redeemer had sacrificed himself without guilt was evidently a tendentious distortion, which offered difficulties to logical understanding. For how could someone guiltless of the act of murder take on himself the guilt of the murderers by allowing himself to be killed? In the historical reality there was no such contradiction. The 'redeemer' could be none other than the most guilty person, the ringleader of the company of brothers who had overpowered their father. We must in my judgement leave it undecided whether there was such a chief rebel and ringleader. That is possible; but we must also bear in mind that each one of the company of brothers certainly had a wish to commit the deed by himself alone and so to create an exceptional position for himself and to find a substitute for his identification with the father which was having to be given up and which was becoming merged in the community. If there was no such ringleader, then Christ was the heir to a wishful phantasy which remained unfulfilled; if there was one, then he was his successor and his reincarnation. But no matter whether what we have here is a phantasy or the return of a forgotten reality, in any case the origin of the concept of a hero is to be found at this point - the hero who always rebels against his father and kills him in some shape or other.¹ Here too is the true basis for the 'tragic guilt' of the hero of drama, which is otherwise hard to explain. It can scarcely be doubted that the hero and chorus in Greek drama represent the same rebellious hero and company of brothers; and it is not without significance that in the Middle Ages what the theatre started with afresh was the representation of the story of the Passion.

We have already said that the Christian ceremony of Holy Communion, in which the believer incorporates the Saviour's blood and flesh, repeats the content of the old totem meal - no doubt only in its affectionate meaning, expressive of veneration, and not in its aggressive meaning. The ambivalence that dominates the relation to the father was clearly shown, however, in the final outcome of the religious novelty. Ostensibly aimed at propitiating the father god, it ended in his being dethroned and got rid of. Judaism had been a religion of the father; Christianity became a religion of the son. The old God the Father fell back behind Christ; Christ, the Son, took his place, just as every son had hoped to do in primaeval times. Paul, who carried Judaism on, also destroyed it. No doubt he owed his success in the first instance to the fact that, through the idea of the redeemer, he exorcized humanity's sense of guilt; but he owed it as well to the circumstance that he abandoned the 'chosen' character of his people and its visible mark - circumcision - so that the new religion could be a universal one, embracing all men. Though a part may have been played in Paul's taking this step by his personal desire for revenge for the rejection of his innovation in Jewish circles, yet it also restored a feature of the old Aten religion - it removed a restriction which that religion had acquired when it was handed over to a new vehicle, the Jewish people.

¹ Ernest Jones has pointed out that the god Mithras, who kills the bull, might represent this ringleader boasting of his deed. It is well known for how long the worship of Mithras struggled with the young Christianity for the final victory.

In some respects the new religion meant a cultural regression as compared with the older, Jewish one, as regularly happens when a new mass of people, of a lower level, break their way in or are given admission. The Christian religion did not maintain the high level in things of the mind to which Judaism had soared. It was no longer strictly monotheist, it took over numerous symbolic rituals from surrounding peoples, it re-established the great mother-goddess and found room to introduce many of the divine figures of polytheism only lightly veiled, though in subordinate positions. Above all, it did not, like the Aten religion and the Mosaic one which followed it, exclude the entry of superstitious, magical and mystical elements, which were to prove a severe inhibition upon the intellectual development of the next two thousand years.

The triumph of Christianity was a fresh victory for the priests of Amun over Akhenaten's god after an interval of fifteen hundred years and on a wider stage. And yet in the history of religion - that is, as regards the return of the repressed - Christianity was an advance and from that time on the Jewish religion was to some extent a fossil.

It would be worth while to understand how it was that the monotheist idea made such a deep impression precisely on the Jewish people and that they were able to maintain it so tenaciously. It is possible, I think, to find an answer. Fate had brought the great deed and misdeed of primeval days, the killing of the father, closer to the Jewish people by causing them to repeat it on the person of Moses, an outstanding father-figure. It was a case of 'acting out' instead of remembering, as happens so often with neurotics during the work of analysis. To the suggestion that they should remember, which was made to them by the doctrine of Moses, they reacted, however, by disavowing their action; they remained halted at the recognition of the great father and thus blocked their access to the point from which Paul was later to start his continuation of the primal history. It is scarcely a matter of indifference or of chance that the violent killing of another great man became the starting-point of Paul's new religious creation as well. This was a man whom a small number of adherents in Judaea regarded as the Son of God and as the Messiah who had been announced, and to whom, too, a part of the childhood story invented for Moses was later carried over, but of whom in fact we know scarcely more with certainty than of Moses - whether he was really the great teacher portrayed by the Gospels or whether, rather, it was not the fact and circumstances of his death which were decisive for the importance which his figure acquired. Paul, who became his apostle, had not known him himself.

The killing of Moses by his Jewish people, recognized by Sellin from traces of it in tradition (and also, strange to say, accepted by the young Goethe without any evidence¹) thus becomes an indispensable part of our construction, an important link between the forgotten event of primaeval times and its later emergence in the form of the monotheist religions.² It is plausible to conjecture that remorse for the murder of Moses provided the stimulus for the wishful phantasy of the Messiah, who was to return and lead his people to redemption and the promised world-dominion. If Moses was this first Messiah, Christ became his substitute and successor, and Paul could exclaim to the peoples with some historical justification: 'Look! the Messiah has really come: he has been murdered before your eyes!' Then, too, there is a piece of historical truth in Christ's resurrection, for he was the resurrected Moses and behind him the returned primal father of the primitive horde, transfigured and, as the son, put in the place of the father.

The poor Jewish people, who with their habitual stubbornness continued to disavow the father's murder, atoned heavily for it in the course of time. They were constantly met with the reproach 'You killed our God!' And this reproach is true, if it is correctly translated. If it is brought into relation with the history of religions, it runs: 'You will not *admit* that you murdered God (the primal picture of God, the primal father, and his later reincarnations).' There should be an addition declaring: 'We did the same thing, to be sure, but we have *admitted* it and since then we have been absolved.' Not all the reproaches with which anti-semitism persecutes the descendants of the Jewish people can appeal to a similar justification. A phenomenon of such intensity and permanence as the people's hatred of the Jews must of course have more than one ground. It is possible to find a whole number of grounds, some of them clearly derived from reality, which call for no interpretation, and others, lying deeper and derived from hidden sources, which might be regarded as the specific reasons. Of the former, the reproach of being aliens is perhaps the weakest, since in many places dominated by anti-semitism to-day the Jews were among the oldest portions of the population or had even been there before the present inhabitants. This applies, for instance, to the city of Cologne, to which the Jews came with the Romans, before it was occupied by the Germans. Other grounds for hating the Jews are stronger - thus, the circumstances that they live for the most part as minorities among other peoples, for the communal feeling of groups requires, in order to complete it, hostility towards some extraneous minority, and the numerical weakness of this excluded minority encourages its suppression. There are, however, two other characteristics of the Jews which are quite unforgivable. First is the fact that in some respects they are different from their 'host' nations. They are not fundamentally different, for they are not Asiatics of a foreign race, as their enemies maintain, but composed for the most part of remnants of the Mediterranean peoples and heirs of the Mediterranean civilization. But they are none the less different, often in an indefinable way different, especially from the Nordic peoples, and the intolerance of groups is often, strangely enough, exhibited more strongly against small differences than against fundamental ones. The other point has a still greater effect: namely, that they defy all oppression, that the most cruel persecutions have not succeeded in exterminating them, and, indeed, that on the contrary they show a capacity for holding their own in commercial life and, where they are admitted, for making valuable contributions to every form of cultural activity.

¹ 'Israel in der Wüste'. In the Weimar Edition, 7, 170.

² On this subject see Frazer's well-known discussions in Part III of *The Golden Bough* (*The Dying God*).

The deeper motives for hatred of the Jews are rooted in the remotest past ages; they operate from the unconscious of the peoples, and I am prepared to find that at first they will not seem credible. I venture to assert that jealousy of the people which declared itself the first-born, favourite child of God the Father, has not yet been surmounted among other peoples even to-day: it is as though they had thought there was truth in the claim. Further, among the customs by which the Jews made themselves separate, that of circumcision has made a disagreeable, uncanny impression, which is to be explained, no doubt, by its recalling the dreaded castration and along with it a portion of the *primaeval* past which is gladly forgotten. And finally, as the latest motive in this series, we must not forget that all those peoples who excel to-day in their hatred of Jews became Christians only in late historic times, often driven to it by bloody coercion. It might be said that they are all 'mis-baptized'. They have been left, under a thin veneer of Christianity, what their ancestors were, who worshipped a barbarous polytheism. They have not got over a grudge against the new religion which was imposed on them; but they have displaced the grudge on to the source from which Christianity reached them. The fact that the Gospels tell a story which is set among Jews, and in fact deals only with Jews, has made this displacement easy for them. Their hatred of Jews is at bottom a hatred of Christians, and we need not be surprised that in the German National-Socialist revolution this intimate relation between the two monotheist religions finds such a clear expression in the hostile treatment of both of them.

E

DIFFICULTIES

Perhaps by what I have said I have succeeded in establishing the analogy between neurotic processes and religious events and in thus indicating the unsuspected origin of the latter. In this transference from individual to group psychology two difficulties arise, differing in their nature and importance, to which we must now turn.

The first of these is that we have here dealt with only a single instance from the copious phenomenology of religions and have thrown no light on any others. I must regretfully admit that I am unable to give more than this one example and that my expert knowledge is insufficient to complete the enquiry. From my limited information I may perhaps add that the case of the founding of the Mahommedan religion seems to me like an abbreviated repetition of the Jewish one, of which it emerged as an imitation. It appears, indeed, that the Prophet intended originally to accept Judaism completely for himself and his people. The recapture of the single great primal father brought the Arabs an extraordinary exaltation of their self-confidence, which led to great worldly successes but exhausted itself in them. Allah showed himself far more grateful to his chosen people than Yahweh did to his. But the internal development of the new religion soon came to a stop, perhaps because it lacked the depth which had been caused in the Jewish case by the murder of the founder of their religion. The apparently rationalistic religions of the East are in their core ancestor-worship and so come to a halt, too, at an early stage of the reconstruction of the past. If it is true that in primitive peoples of to-day the recognition of a supreme being is the only content of their religion, we can only regard this as an atrophy of religious development and bring it into relation with the countless cases of rudimentary neuroses which are to be observed in the other field. Why it is that in the one case just as in the other things have gone no further, our knowledge is in both cases insufficient to tell us. We can only attribute the responsibility to the individual endowment of these peoples, the direction taken by their activity and their general social condition. Moreover, it is a good rule in the work of analysis to be content to explain what is actually before one and not to seek to explain what has *not* happened.

The second difficulty about this transference to group psychology is far more important, because it poses a fresh problem of a fundamental nature. It raises the question in what form the operative tradition in the life of peoples is present - a question which does not occur with individuals, since there it is solved by the existence in the unconscious of memory-traces of the past. Let us return to our historical example. We have attributed the compromise at Kadesh to the survival of a powerful tradition among those who had returned from Egypt. This case involves no problem. According to our theory, a tradition of this kind was based on conscious memories of oral communications which people then living had received from their ancestors only two or three generations back who had themselves been participants and eye-witnesses of the events in question. But can we believe the same thing of the later centuries - that the tradition still had its basis in a knowledge normally handed on from grandfather to grandchild? It is no longer possible to say, as it was in the earlier case, who the people were who preserved this knowledge and handed it on by word of mouth. According to Sellin the tradition of the murder of Moses was always in the possession of priestly circles till eventually it found expression in writing which alone enabled Sellin to discover it. But it can only have been known to a few people; it was not public property. And is that enough to explain its effect? Is it possible to attribute to knowledge held like this by a few people the power to produce such a lasting emotion in the masses when it came to their notice? It seems, rather, as though there must have been something present in the ignorant masses, too, which was in some way akin to the knowledge of the few and went half way to meet it when it was uttered.

A decision is made still more difficult when we turn to the analogous case in *primaeval* times. It is quite certain that in the course of thousands of years the fact was forgotten that there had been a primal father with the characteristics we know and what his fate had been; nor can we suppose that there was any oral tradition of it, as we can in the case of Moses. In what sense, then, does a tradition come in question at all? In what form can it have been present?

In order to make it easier for readers who do not desire or are not prepared to plunge into a complicated psychological state of affairs, I will anticipate the outcome of the investigation that is to follow. In my opinion there is an almost complete conformity in this respect between the individual and the group: in the group too an impression of the past is retained in unconscious memory-traces.

In the case of the individual we believe we can see clearly. The memory-trace of his early experience has been preserved in him, but in a special psychological condition. The individual may be said to have known it always, just as one knows about the repressed. Here we have formed ideas, which can be confirmed without difficulty through analysis, of how something can be forgotten and how it can then reappear after a while. What is forgotten is not extinguished but only 'repressed'; its memory-traces are present in all their freshness, but isolated by 'anticathexes'. They cannot enter into communication with other intellectual processes; they are unconscious - inaccessible to consciousness. It may also be that certain portions of the repressed, having evaded the process, remain accessible to memory and occasionally emerge into consciousness; but even so they are isolated, like foreign bodies out of connection with the rest. It may be so, but it need not be so; repression may also be complete, and it is with that alternative that we shall deal in what follows.

The repressed retains its upward urge, its effort to force its way to consciousness. It achieves its aim under three conditions: (1) if the strength of the anticathexis is diminished by pathological processes which overtake the other part, what we call the ego, or by a different distribution of the cathectic energies in that ego, as happens regularly in the state of sleep; (2) if the instinctual elements attaching to the repressed receive a special reinforcement (of which the best example is the processes during puberty); and (3) if at any time in recent experience impressions or experiences occur which resemble the repressed so closely that they are able to awaken it. In the last case the recent experience is reinforced by the latent energy of the repressed, and the repressed comes into operation behind the recent experience and with its help. In none of these three alternatives does what has hitherto been repressed enter consciousness smoothly and unaltered; it must always put up with distortions which testify to the influence of the resistance (not entirely overcome) arising from the anticathexis, or to the modifying influence of the recent experience or to both.

The difference between whether a psychical process is conscious or unconscious has served us as a criterion and a means of finding our bearings. The repressed is unconscious. Now it would simplify things agreeably if this sentence admitted of reversal - if, that is, the difference between the qualities of conscious (*Cs.*) and unconscious (*Ucs.*) coincided with the distinction between 'belonging to the ego' and 'repressed'. The fact of there being isolated and unconscious things like this in our mental life would be sufficiently novel and important. But in reality the position is more complicated. It is true that everything repressed is unconscious, but it is not true that everything belonging to the ego is conscious. We notice that consciousness is a transient quality which attaches to a psychical process only in passing. For our purposes therefore we must replace 'conscious' by 'capable of being conscious' and we call this quality 'preconscious' (*Pcs.*). We then say, more correctly, that the ego is mainly preconscious (virtually conscious) but that portions of the ego are unconscious.

The establishment of this latter fact shows us that the qualities on which we have hitherto relied are insufficient to give us our bearings in the obscurity of mental life. We must introduce another distinction which is no longer qualitative but *topographical* and - what gives it special value - at the same time *genetic*. We now distinguish in our mental life (which we regard as an apparatus compounded of several agencies, districts or provinces) one region which we call the *ego* proper and another which we name the *id*. The *id* is the older of the two; the *ego* has developed out of it, like a cortical layer, through the influence of the external world. It is in the *id* that all our primary instincts are at work, all the processes in the *id* take place unconsciously. The *ego*, as we have already said, coincides with the region of the preconscious; it includes portions which normally remain unconscious. The course of events in the *id*, and their mutual interaction, are governed by quite other laws than those prevailing in the *ego*. It is in fact the discovery of these differences that has led to our new view and justifies it.

The *repressed* is to be counted as belonging to the *id* and is subject to the same mechanisms; it is distinguished from it only in respect to its genesis. The differentiation is accomplished in the earliest period of life, while the *ego* is developing out of the *id*. At that time a portion of the contents of the *id* is taken into the *ego* and raised to the preconscious state; another portion is not affected by this translation and remains behind in the *id* as the unconscious proper. In the further course of the formation of the *ego*, however, certain psychical impressions and processes in the *ego* are excluded from it by a defensive process; the characteristic of being preconscious is withdrawn from them, so that they are once more reduced to being component portions of the *id*. Here then is the 'repressed' in the *id*. So far as intercourse between the two mental provinces is concerned, we therefore assume that, on the one hand, unconscious processes in the *id* are raised to the level of the preconscious and incorporated into the *ego*, and that, on the other hand, preconscious material in the *ego* can follow the opposite path and be put back into the *id*. The fact that later on a special region - that of the 'super-ego' - is separated off in the *ego* lies outside our present interest.

All of this may appear to be far from simple. But when one has grown reconciled to this unusual spatial view of the mental apparatus, it can present no particular difficulties to the imagination. I will add the further comment that the psychical topography that I have developed here has nothing to do with the anatomy of the brain, and actually only touches it at one point. What is unsatisfactory in this picture - and I am aware of it as clearly as anyone - is due to our complete ignorance of the *dynamic* nature of the mental processes. We tell ourselves that what distinguishes a conscious idea from a preconscious one, and the latter from an unconscious one, can only be a modification, or perhaps a different distribution, of psychical energy. We talk of cathexes and hypercathexes, but beyond this we are without any knowledge on the subject or even any starting-point for a serviceable working hypothesis. Of the phenomenon of consciousness we can at least say that it was originally attached to perception. All sensations which originate from the perception of painful, tactile, auditory or visual stimuli are what are most readily conscious. Thought-processes, and whatever may be analogous to them in the *id*, are in themselves unconscious and obtain access to consciousness by becoming linked to the mnemonic residues of visual and auditory perceptions along the path of the function of speech. In animals, which lack speech, these conditions must be of a simpler kind.

The impressions of early traumas, from which we started out, are either not translated into the preconscious or are quickly put back by repression into the id-condition. Their mnemonic residues are in that case unconscious and operate from the id. We believe we can easily follow their further vicissitudes so long as it is a question of what has been experienced by the subject himself. But a fresh complication arises when we become aware of the probability that what may be operative in an individual's psychical life may include not only what he has experienced himself but also things that were innately present in him at his birth, elements with a phylogenetic origin - an *archaic heritage*. The questions then arise of what this consists in, what it contains and what is the evidence for it.

The immediate and most certain answer is that it consists in certain dispositions such as are characteristic of all living organisms: in the capacity and tendency, that is, to enter particular lines of development and to react in a particular manner to certain excitations, impressions and stimuli. Since experience shows that there are distinctions in this respect between individuals of the human species, the archaic heritage must include these distinctions; they represent what we recognize as the *constitutional* factor in the individual. Now, since all human beings, at all events in their early days, have approximately the same experiences, they react to them, too, in a similar manner; a doubt was therefore able to arise whether we should not include these reactions, along with their individual distinctions, in the archaic heritage. This doubt should be put on one side: our knowledge of the archaic heritage is not enlarged by the fact of this similarity.

Nevertheless, analytic research has brought us a few results which give us cause for thought. There is, in the first place, the universality of symbolism in language. The symbolic representation of one object by another - the same thing applies to actions - is familiar to all our children and comes to them, as it were, as a matter of course. We cannot show in regard to them how they have learnt it and must admit that in many cases learning it is impossible. It is a question of an original knowledge which adults afterwards forget. It is true that an adult makes use of the same symbols in his dreams, but he does not understand them unless an analyst interprets them to him, and even then he is reluctant to believe the translation. If he makes use of one of the very common figures of speech in which this symbolism is recorded, he is obliged to admit that its true sense has completely escaped him. Moreover, symbolism disregards differences of language; investigations would probably show that it is ubiquitous - the same for all peoples. Here, then, we seem to have an assured instance of an archaic heritage dating from the period at which language developed. But another explanation might still be attempted. It might be said that we are dealing with thought-connections between ideas - connections which had been established during the historical development of speech and which have to be repeated now every time the development of speech has to be gone through in an individual. It would thus be a case of the inheritance of an intellectual disposition similar to the ordinary inheritance of an instinctual disposition - and once again it would be no contribution to our problem.

The work of analysis has, however, brought something else to light which exceeds in its importance what we have so far considered. When we study the reactions to early traumas, we are quite often surprised to find that they are not strictly limited to what the subject himself has really experienced but diverge from it in a way which fits in much better with the model of a phylogenetic event and, in general, can only be explained by such an influence. The behaviour of neurotic children towards their parents in the Oedipus and castration complex abounds in such reactions, which seem unjustified in the individual case and only become intelligible phylogenetically - by their connection with the experience of earlier generations. It would be well worth while to place this material, which I am able to appeal to here, before the public in a collected form. Its evidential value seems to me strong enough for me to venture on a further step and to posit the assertion that the archaic heritage of human beings comprises not only dispositions but also subject-matter - memory-traces of the experience of earlier generations. In this way the compass as well as the importance of the archaic heritage would be significantly extended.

On further reflection I must admit that I have behaved for a long time as though the inheritance of memory-traces of the experience of our ancestors, independently of direct communication and of the influence of education by the setting of an example, were established beyond question. When I spoke of the survival of a tradition among a people or of the formation of a people's character, I had mostly in mind an inherited tradition of this kind and not one transmitted by communication. Or at least I made no distinction between the two and was not clearly aware of my audacity in neglecting to do so. My position, no doubt, is made more difficult by the present attitude of biological science, which refuses to hear of the inheritance of acquired characters by succeeding generations. I must, however, in all modesty confess that nevertheless I cannot do without this factor in biological evolution. The same thing is not in question, indeed, in the two cases: in the one it is a matter of acquired characters which are hard to grasp, in the other of memory-traces of external events - something tangible, as it were. But it may well be that at bottom we cannot imagine one without the other.

If we assume the survival of these memory-traces in the archaic heritage, we have bridged the gulf between individual and group psychology: we can deal with peoples as we do with an individual neurotic. Granted that at the time we have no stronger evidence for the presence of memory-traces in the archaic heritage than the residual phenomena of the work of analysis which call for a phylogenetic derivation, yet this evidence seems to us strong enough to postulate that such is the fact. If it is not so, we shall not advance a step further along the path we entered on, either in analysis or in group psychology. The audacity cannot be avoided.

And by this assumption we are effecting something else. We are diminishing the gulf which earlier periods of human arrogance had torn too wide apart between mankind and the animals. If any explanation is to be found of what are called the instincts of animals, which allow them to behave from the first in a new situation in life as though it were an old and familiar one - if any explanation at all is to be found of this instinctive life of animals, it can only be that they bring the experiences of their species with them into their own new existence - that is, that they have preserved memories of what was experienced by their ancestors. The position in the human animal would not at bottom be different. His own archaic heritage corresponds to the instincts of animals even though it is different in its compass and contents.

After this discussion I have no hesitation in declaring that men have always known (in this special way) that they once possessed a primal father and killed him.

Two further questions must now be answered. First, under what conditions does a memory of this kind enter the archaic heritage? And, secondly, in what circumstances can it become active - that is, can it advance to consciousness from its unconscious state in the id, even though in an altered and distorted shape? The answer to the first question is easy to formulate: the memory enters the archaic heritage if the event was important enough, or repeated often enough, or both. In the case of parricide both conditions are fulfilled. On the second question there is this to be said. A whole number of influences may be concerned, not all of which are necessarily known. A spontaneous development is also conceivable, on the analogy of what happens in some neuroses. What is certainly of decisive importance, however, is the awakening of the forgotten memory trace by a recent real repetition of the event. The murder of Moses was a repetition of this kind and, later, the supposed judicial murder of Christ: so that these events come into the foreground as causes. It seems as though the genesis of monotheism could not do without these occurrences. We are reminded of the poet's words:

Was unsterblich im Gesang soll leben,
Muss im Leben untergehn.¹

¹ [Literally: 'What is to live immortal in song must perish in life.'] Schiller, 'Die Götter Griechenlands'.

And lastly a remark which brings up a psychological argument. A tradition that was based only on communication could not lead to the compulsive character that attaches to religious phenomena. It would be listened to, judged, and perhaps dismissed, like any other piece of information from outside; it would never attain the privilege of being liberated from the constraint of logical thought. It must have undergone the fate of being repressed, the condition of lingering in the unconscious, before it is able to display such powerful effects on its return, to bring the masses under its spell, as we have seen with astonishment and hitherto without comprehension in the case of religious tradition. And this consideration weighs heavily in favour of our believing that things really happened in the way we have tried to picture them or at least in some similar way.

PART II

SUMMARY AND RECAPITULATION

The part of this study which follows cannot be given to the public without extensive explanations and apologies. For it is nothing other than a faithful (and often word-for-word) repetition of the first part, abbreviated in some of its critical enquiries and augmented by additions relating to the problem of how the special character of the Jewish people arose. I am aware that a method of exposition such as this is no less inexpedient than it is inartistic. I myself deplore it unreservedly. Why have I not avoided it? The answer to that is not hard for me to find, but it is not easy to confess. I found myself unable to wipe out the traces of the history of the work's origin, which was in any case unusual.

Actually it has been written twice: for the first time a few years ago in Vienna, where I did not think it would be possible to publish it. I determined to give it up; but it tormented me like an unladen ghost, and I found a way out by making two pieces of it independent and publishing them in our periodical *Imago*: the psycho-analytic starting-point of the whole thing 'Moses an Egyptian', and the historical construction erected on this 'If Moses was an Egyptian . . .'. The remainder, which included what was really open to objection and dangerous - the application to the genesis of monotheism and the view of religion in general - I held back, as I thought, forever. When, in March 1938, came the unexpected German invasion, which forced me to leave my home but also freed me from my anxiety lest my publication might conjure up a prohibition of psycho-analysis in a place where it was still tolerated. I had scarcely arrived in England before I found the temptation irresistible to make the knowledge I had held back accessible to the world, and I began to revise the third part of my study to fit it on to the two parts that had already been published. This naturally involved a partial re-arrangement of the material. I did not succeed, however, in including the whole of this material in my second version; on the other hand I could not make up my mind to give up the earlier versions entirely. And so it has come about that I have adopted the expedient of attaching a whole piece of the first presentation to the second unchanged - which has brought with it the disadvantage of involving extensive repetition.

I might, however, console myself with the reflection that the things I am treating are in any case so new and so important, apart from how far my account of them is correct, that it can be no misfortune if the public is obliged to read the same thing about them twice over. There are things which should be said more than once and which cannot be said often enough. But the reader must decide of his own free will whether to linger over the subject or to come back to it. He must not be surreptitiously led into having the same thing put before him twice in one book. It is a piece of clumsiness for which the author must take the blame. Unluckily an author's creative power does not always obey his will: the work proceeds as it can, and often presents itself to the author as something independent or even alien.

A

THE PEOPLE OF ISRAEL

If we are clear in our mind that a procedure like ours of accepting what seems to us serviceable in the material presented to us and of rejecting what does not suit us and of putting the different pieces together in accordance with psychological probability - if we are clear that a technique of this kind can give no certainty that we shall arrive at the truth, then it may justly be asked why we are undertaking this work at all. The answer is an appeal to the work's outcome. If we greatly tone down the strictness of the requirements made upon a historico-psychological investigation, it will perhaps be possible to throw light on problems which have always seemed to deserve attention and which recent events have forced upon our observation anew. As we know, of all the peoples who lived round the basin of the Mediterranean in antiquity, the Jewish people is almost the only one which still exists in name and also in substance. It has met misfortunes and ill-treatment with an unexampled capacity for resistance; it has developed special character-traits and incidentally has earned the hearty dislike of every other people. We should be glad to understand more of the source of this viability of the Jews and of how their characteristics are connected with their history.

We may start from a character-trait of the Jews which dominates their relation to others. There is no doubt that they have a particularly high opinion of themselves, that they regard themselves as more distinguished, of higher standing, as superior to other peoples - from whom they are also distinguished by many of their customs.¹ At the same time they are inspired by a peculiar confidence in life, such as is derived from the secret ownership of some precious possession, a kind of optimism: pious people would call it trust in God.

¹ The aspersion, so common in antiquity, that the Jews were 'lepers' (cf. Manetho) no doubt has the sense of a projection: 'they keep as much apart from us as though we were lepers.'

We know the reason for this behaviour and what their secret treasure is. They really regard themselves as God's chosen people, they believe that they stand especially close to him; and this makes them proud and confident. Trustworthy reports tell us that they behaved in Hellenistic times just as they do to-day, so that the complete Jew was already there; and the Greeks, among whom and alongside of whom they lived, reacted to the Jewish characteristics in the same way as their 'hosts' do to-day. It might be thought that they reacted as though they too believed in the superiority which the people of Israel claimed for themselves. If one is the declared favourite of the dreaded father, one need not be surprised at the jealousy of one's brothers and sisters, and the Jewish legend of Joseph and his brethren shows very well where this jealousy can lead. The course of world-history seemed to justify the presumption of the Jews, since, when later on it pleased God to send mankind a Messiah and redeemer, he once again chose him from the Jewish people. The other peoples might have had occasion then to say to themselves: 'Indeed, they were right, they *are* God's chosen people.' But instead of this, what happened was that redemption by Jesus Christ only intensified their hatred of the Jews, while the Jews themselves gained no advantage from this second act of favouritism, since they did not recognize the redeemer.

On the basis of our earlier discussions, we may now assert that it was the man Moses who imprinted this trait - significant for all time - upon the Jewish people. He raised their self-esteem by assuring them that they were God's chosen people, he enjoined them to holiness and pledged them to be apart from others. Not that other peoples were lacking in self-esteem. Just as to-day, so in those days each nation thought itself better than any other. But the self-esteem of the Jews was given a religious anchorage by Moses: it became a part of their religious faith. Owing to their especially intimate relation to their God they acquired a share in his grandeur. And since we know that behind the God who had chosen the Jews and freed them from Egypt stands the figure of Moses, who had done precisely that, ostensibly at God's command, we venture to declare that it was this one man Moses who created the Jews. It is to him that this people owes its tenacity of life but also much of the hostility it has experienced and still experiences.

B

THE GREAT MAN

How is it possible for a single man to evolve such extraordinary effectiveness that he can form a people out of random individuals and families, can stamp them with their definitive character and determine their fate for thousands of years? Is not a hypothesis such as this a relapse into the mode of thought which led to myths of a creator and to the worship of heroes, into times in which the writing of history was nothing more than a report of the deeds and destinies of single individuals, of rulers or conquerors? The modern tendency is rather towards tracing back the events of human history to more concealed, general and impersonal factors, to the compelling influence of economic conditions, to alterations in food habits, to advances in the use of materials and tools, to migrations brought about by increases in population and climatic changes. Individuals have no other part to play in this than as exponents or representatives of group trends, which are bound to find expression and do so in these particular individuals largely by chance.

These are perfectly justifiable lines of approach, but they give us occasion for drawing attention to an important discrepancy between the attitude taken up by our organ of thought and the arrangement of things in the world, which are supposed to be grasped by means of our thought. It is enough for our need to discover causes (which, to be sure, is imperative) if each event has *one* demonstrable cause. But in the reality lying outside us that is scarcely the case; on the contrary, each event seems to be overdetermined and proves to be the effect of several convergent causes. Frightened by the immense complication of events, our investigations take the side of one correlation as against another and set up contradictions which do not exist but have only arisen owing to a rupture of more comprehensive relations.¹ Accordingly, if the investigation of a particular case demonstrates to us the transcendent influence of a single personality, our conscience need not reproach us with having by this hypothesis flown in the face of the doctrine of the importance of the general and impersonal factors. There is room in principle for both. In the case of the genesis of monotheism, however, we can point to no external factor other than the one we have already mentioned - that this development was linked with the establishment of closer relations between different nations and with the building up of a great empire.

¹ I protest, however, against being misunderstood to say that the world is so complicated that any assertion one may make is bound to hit upon a piece of truth somewhere. No. Our thought has upheld its liberty to discover dependent relations and connections to which there is nothing corresponding in reality; and it clearly sets a very high value on this gift, since it makes such copious use of it both inside and outside of science.

Thus we reserve a place for 'great men' in the chain, or rather the network, of causes. But it may not, perhaps, be quite useless to enquire under what conditions we confer this title of honour. We shall be surprised to find that it is never quite easy to answer this question. A first formulation - 'we do so if a man possesses to a specially high degree qualities that we value greatly' - clearly misses the mark in every respect. Beauty, for instance, and muscular strength, however enviable they may be, constitute no claim to 'greatness'. It would seem, then, that the qualities have to be mental ones - psychical and intellectual distinctions. As regards these, we are held up by the consideration that nevertheless we should not unhesitatingly describe someone as a great man simply because he was extraordinarily efficient in some particular sphere. We should certainly not do so in the case of a chess master or of a virtuoso on a musical instrument; but not very easily, either, in the case of a distinguished artist or scientist. In such cases we should naturally speak of him as a great poet, painter, mathematician or physicist, or as a pioneer in the field of this or that activity; but we refrain from pronouncing him a great man. If we unhesitatingly declare that, for instance, Goethe and Leonardo da Vinci and Beethoven were great men, we must be led to it by something other than admiration for their splendid creations. If precisely such examples as these did not stand in the way, the idea would probably occur to us that the name of a 'great man' is preferably reserved for men of action - conquerors, generals, rulers - and is in recognition of the greatness of their achievement, the force of the effects to which they gave rise. But this too is unsatisfactory and is entirely contradicted by our condemnation of so many worthless figures whose effects upon their contemporary world and upon posterity can nevertheless not be disputed. Nor shall we be able to choose success as a sign of greatness, when we reflect on the majority of great men who instead of achieving success have perished in misfortune.

For the moment, then, we are inclined to decide that it is not worth while to look for a connotation of the concept of a 'great man' that is unambiguously determined. It seems to be only a loosely used and somewhat arbitrarily conferred recognition of an over-large development of certain human qualities, with some approximation to the original literal sense of 'greatness'. We must recollect, too, that we are not so much interested in the essence of great men as in the question of the means by which they affect their fellow-men. We will, however, keep this enquiry as short as possible, since it threatens to lead us far away from our goal.

Let us, therefore, take it for granted that a great man influences his fellow-men in two ways: by his personality and by the idea which he puts forward. That idea may stress some ancient wishful image of the masses, or it may point out a new wishful aim to them, or it may cast its spell over them in some other way. Occasionally - and this is undoubtedly the more primary case - the personality works by itself and the idea plays a quite trivial part. Not for a moment are we in the dark as to why a great man ever becomes important. We know that in the mass of mankind there is a powerful need for an authority who can be admired, before whom one bows down, by whom one is ruled and perhaps even ill-treated. We have learnt from the psychology of individual men what the origin is of this need of the masses. It is a longing for the father felt by everyone from his childhood onwards, for the same father whom the hero of legend boasts he has overcome. And now it may begin to dawn on us that all the characteristics with which we equipped the great man are paternal characteristics, and that the essence of great men for which we vainly searched lies in this conformity. The decisiveness of thought, the strength of will, the energy of action are part of the picture of a father - but above all the autonomy and independence of the great man, his divine unconcern which may grow into ruthlessness. One must admire him, one may trust him, but one cannot avoid being afraid of him too. We should have been led to realize this from the word itself: who but the father can have been the 'great man' in childhood?

There is no doubt that it was a mighty prototype of a father which, in the person of Moses, stooped to the poor Jewish bondsmen to assure them that they were his dear children. And no less overwhelming must have been the effect upon them of the idea of an only, eternal, almighty God, to whom they were not too mean for him to make a covenant with them and who promised to care for them if they remained loyal to his worship. It was probably not easy for them to distinguish the image of the man Moses from that of his God; and their feeling was right in this, for Moses may have introduced traits of his own personality into the character of his God - such as his wrathful temper and his relentlessness. And if, this being so, they killed their great man one day, they were only repeating a misdeed which in ancient times had been committed, as prescribed by law, against the Divine King and which, as we know, went back to a still more ancient prototype.¹

If on the one hand we thus see the figure of the great man grown to divine proportions, yet on the other hand we must recall that the father too was once a child. The great religious idea for which the man Moses stood was, on our view, not his own property: he had taken it over from King Akhenaten. And he, whose greatness as the founder of a religion is unequivocally established, may perhaps have been following hints which had reached him - from near or distant parts of Asia - through the medium of his mother or by other paths.

¹ Cf. Frazer, loc. cit.

We cannot follow the chain of events further, but if we have rightly recognized these first steps, the monotheist idea returned like a boomerang to the land of its origin. Thus it seems unfruitful to try to fix the credit due to an individual in connection with a new idea. It is clear that many have shared in its development and made contributions to it. And, again, it would obviously be unjust to break off the chain of causes at Moses and to neglect what was effected by those who succeeded him and carried on his ideas, the Jewish Prophets. The seed of monotheism failed to ripen in Egypt. The same thing might have happened in Israel after the people had thrown off the burdensome and exacting religion. But there constantly arose from the Jewish people men who revived the fading tradition, who renewed the admonitions and demands made by Moses, and who did not rest till what was lost had been established once again. In the course of constant efforts over centuries, and finally owing to two great reforms, one before and one after the Babylonian exile, the transformation was accomplished of the popular god Yahweh into the God whose worship had been forced upon the Jews by Moses. And evidence of the presence of a peculiar psychical aptitude in the masses who had become the Jewish people is revealed by the fact that they were able to produce so many individuals prepared to take on the burdens of the religion of Moses in return for the reward of being the chosen people and perhaps for some other prizes of a similar degree.

C

THE ADVANCE IN INTELLECTUALITY

In order to bring about lasting psychical results in a people, it is clearly not enough to *assure* them that they have been chosen by the deity. The fact must also be *proved* to them in some way if they are to believe it and to draw consequences from the belief. In the religion of Moses the Exodus from Egypt served as the proof; God, or Moses in his name, was never tired of appealing to this evidence of favour. The feast of the Passover was introduced in order to maintain the memory of that event, or, rather, an old-established feast was injected with the contents of that memory. Nevertheless, it was only a memory: the Exodus belonged to a hazy past. In the present, signs of God's favour were decidedly scanty; the people's history pointed rather to his *disfavour*. Primitive peoples used to depose their gods or even to castigate them, if they failed to do their duty in securing them victory, happiness and comfort. In all periods kings have been treated in no way differently from gods; an ancient identity is thus revealed: an origin from a common root. Thus, modern peoples, too, are in the habit of expelling their kings if the glory of their reign is spoilt by defeats and the corresponding losses in territory and money. Why the people of Israel, however, clung more and more submissively to their God the worse they were treated by him - that is a problem which for the moment we must leave on one side.

It may encourage us to enquire whether the religion of Moses brought the people nothing else besides an enhancement of their self-esteem owing to their consciousness of having been chosen. And indeed another factor can easily be found. That religion also brought the Jews a far grander conception of God, or, as we might put it more modestly, the conception of a grander God. Anyone who believed in this God had some kind of share in his greatness, might feel exalted himself. For an unbeliever this is not entirely self-evident; but we may perhaps make it easier to understand if we point to the sense of superiority felt by a Briton in a foreign country which has been made insecure owing to an insurrection - a feeling that is completely absent in a citizen of any small continental state. For the Briton counts on the fact that his Government will send along a warship if a hair of his head is hurt, and that the rebels understand that very well - whereas the small state possesses no warship at all. Thus, pride in the greatness of the British Empire has a root as well in the consciousness of the greater security - the protection - enjoyed by the individual Briton. This may resemble the conception of a grand God. And, since one can scarcely claim to assist God in the administration of the world, the pride in God's greatness fuses with the pride in being chosen by him.

Among the precepts of the Moses religion there is one that is of greater importance than appears to begin with. This is the prohibition against making an image of God - the compulsion to worship a God whom one cannot see. In this, I suspect, Moses was outdoing the strictness of the Aten religion. Perhaps he merely wanted to be consistent: his God would in that case have neither a name nor a countenance. Perhaps it was a fresh measure against magical abuses. But if this prohibition were accepted, it must have a profound effect. For it meant that a sensory perception was given second place to what may be called an abstract idea - a triumph of intellectuality over sensuality or, strictly speaking, an instinctual renunciation, with all its necessary psychological consequences.

This may not seem obvious at first sight, and before it can carry conviction we must recall other processes of the same character in the development of human civilization. The earliest of these and perhaps the most important is merged in the obscurity of *primaeval* ages. Its astonishing effects compel us to assert its occurrence. In our children, in adults who are neurotic, as well as in primitive peoples, we meet with the mental phenomenon which we describe as a belief in the 'omnipotence of thoughts'. In our judgement this lies in an over-estimation of the influence which our mental (in this case, intellectual) acts can exercise in altering the external world. At bottom, all magic, the precursor of our technology, rests on this premiss. All the magic of words, too, has its place here, and the conviction of the power which is bound up with the knowledge and pronouncing of a name. The 'omnipotence of thoughts' was, we suppose, an expression of the pride of mankind in the development of speech, which resulted in such an extraordinary advancement of intellectual activities. The new realm of intellectuality was opened up, in which ideas, memories and inferences became decisive in contrast to the lower psychical activity which had direct perceptions by the sense-organs as its content. This was unquestionably one of the most important stages on the path to hominization.

We can far more easily grasp another process of a later date. Under the influence of external factors into which we need not enter here and which are also in part insufficiently known, it came about that the matriarchal social order was succeeded by the patriarchal one - which, of course, involved a revolution in the juridical conditions that had so far prevailed. An echo of this revolution seems still to be audible in the *Oresteia* of Aeschylus. But this turning from the mother to the father points in addition to a victory of intellectuality over sensuality - that is, an advance in civilization, since maternity is proved by the evidence of the senses while paternity is a hypothesis, based on an inference and a premiss. Taking sides in this way with a thought-process in preference to a sense perception has proved to be a momentous step.

At some point between the two events that I have mentioned there was another which shows the most affinity to what we are investigating in the history of religion. Human beings found themselves obliged in general to recognise 'intellectual' forces - forces, that is, which cannot be grasped by the senses (particularly by the sight) but which none the less produce undoubted and indeed extremely powerful effects. If we may rely upon the evidence of language, it was movement of the air that provided the prototype of intellectuality, for intellect derives its name from a breath of wind - '*animus*', '*spiritus*', and the Hebrew '*ruach* (breath)'. This too led to the discovery of the mind as that of the intellectual principle in individual human beings. Observation found the movement of air once again in men's breathing, which ceases when they die. To this day a dying man 'breathes out his spirit'. Now, however, the world of spirits lay open to men. They were prepared to attribute the soul which they had discovered in themselves to everything in Nature. The whole world was animate; and science, which came so much later, had plenty to do in divesting part of the world of its soul once more; indeed it has not completed that task even to-day.

The Mosaic prohibition elevated God to a higher degree of intellectuality, and the way was opened to further alterations in the idea of God which we have still to describe. But we may first consider another effect of the prohibition. All such advances in intellectuality have as their consequence that the individual's self-esteem is increased, that he is made proud - so that he feels superior to other people who have remained under the spell of sensuality. Moses, as we know, conveyed to the Jews an exalted sense of being a chosen people. The dematerialization of God brought a fresh and valuable contribution to their secret treasure. The Jews retained their inclination to intellectual interests. The nation's political misfortune taught it to value at its true worth the one possession that remained to it - its literature. Immediately after the destruction of the Temple in Jerusalem by Titus, the Rabbi Jochanan ben Zakkai asked permission to open the first Torah school in Jabneh. From that time on, the Holy Writ and intellectual concern with it were what held the scattered people together.

This much is generally known and accepted. All I have wanted to do is to add that this characteristic development of the Jewish nature was introduced by the Mosaic prohibition against worshipping God in a visible form.

The pre-eminence given to intellectual labours throughout some two thousand years in the life of the Jewish people has, of course, had its effect. It has helped to check the brutality and the tendency to violence which are apt to appear where the development of muscular strength is the popular ideal. Harmony in the cultivation of intellectual and physical activity, such as was achieved by the Greek people, was denied to the Jews. In this dichotomy their decision was at least in favour of the worthier alternative.

D

RENUNCIATION OF INSTINCT

It is not obvious and not immediately understandable why an advance in intellectuality, a set-back to sensuality, should raise the self-regard both of an individual and of a people. It seems to presuppose the existence of a definite standard of value and of some other person or agency which maintains it. For an explanation let us turn to an analogous case in individual psychology which we have come to understand.

If the id in a human being gives rise to an instinctual demand of an erotic or aggressive nature, the simplest and most natural thing is that the ego, which has the apparatus of thought and the muscular apparatus at its disposal, should satisfy the demand by an action. This satisfaction of the instinct is felt by the ego as pleasure, just as its non-satisfaction would undoubtedly have become a source of unpleasure. Now a case may arise in which the ego abstains from satisfying the instinct in view of external obstacles - namely, if it perceives that the action in question would provoke a serious danger to the ego. An abstention from satisfaction of this kind, the renunciation of an instinct on account of an external hindrance - or, as we say, in obedience to the reality principle - is not pleasurable in any event. The renunciation of the instinct would lead to a lasting tension owing to unpleasure, if it were not possible to reduce the strength of the instinct itself by displacements of energy. Instinctual renunciation can, however, also be imposed for other reasons, which we correctly describe as *internal*. In the course of an individual's development a portion of the inhibiting forces in the external world are internalized and an agency is constructed in the ego which confronts the rest of the ego in an observing, criticizing and prohibiting sense. We call this new agency the *super-ego*. Thenceforward the ego, before putting to work the instinctual satisfactions demanded by the id, has to take into account not merely the dangers of the external world but also the objections of the super-ego, and it will have all the more grounds for abstaining from satisfying the instinct. But whereas instinctual renunciation, when it is for external reasons, is *only* unpleasurable, when it is for internal reasons, in obedience to the super-ego, it has a different economic effect. In addition to the inevitable unpleasurable consequences it also brings the ego a yield of pleasure - a substitutive satisfaction, as it were. The ego feels elevated; it is proud of the instinctual renunciation, as though it were a valuable achievement. We believe we can understand the mechanism of this yield of pleasure. The super-ego is the successor and representative of the individual's parents (and educators) who had supervised his actions in the first period of his life; it carries on their functions almost unchanged. It keeps the ego in a permanent state of dependence and exercises a constant pressure on it. Just as in childhood, the ego is apprehensive about risking the love of its supreme master; it feels his approval as liberation and satisfaction and his reproaches as pangs of conscience. When the ego has brought the super-ego the sacrifice of an instinctual renunciation, it expects to be rewarded by receiving more love from it. The consciousness of deserving this love is felt by it as pride. At the time when the authority had not yet been internalized as a super-ego, there could be the same relation between the threat of loss of love and the claims of instinct: there was a feeling of security and satisfaction when one had achieved an instinctual renunciation out of love for one's parents. But this happy feeling could only assume the peculiar narcissistic character of pride after the authority had itself become a portion of the ego.

What help does this explanation of the satisfaction arising from instinctual renunciation give us towards understanding the processes that we want to study - the elevation of self-regard when there are advances in intellectuality? Very little, it seems. The circumstances are quite different. There is no question of any instinctual renunciation and there is no second person or agency for whose sake the sacrifice is made. We shall soon feel doubts about this last assertion. It can be said that the great man is precisely the authority for whose sake the achievement is carried out; and, since the great man himself operates by virtue of his similarity to the father, there is no need to feel surprise if in group psychology the role of the super-ego falls to him. So that this would apply too to the man Moses in relation to the Jewish people. As regards the other point, however, no proper analogy can be established. An advance in intellectuality consists in deciding against direct sense-perception in favour of what are known as the higher intellectual processes - that is, memories, reflections and inferences. It consists, for instance, in deciding that paternity is more important than maternity, although it cannot, like the latter, be established by the evidence of the senses, and that for that reason the child should bear his father's name and be his heir. Or it declares that our God is the greatest and mightiest, although he is invisible like a gale of wind or like the soul. The rejection of a sexual or aggressive instinctual demand seems to be something quite different from this. Moreover, in the case of some advances in intellectuality - for instance, in the case of the victory of patriarchy - we cannot point to the authority which lays down the standard which is to be regarded as higher. It cannot in this case be the father, since he is only elevated into being an authority by the advance itself. Thus we are faced by the phenomenon that in the course of the development of humanity sensuality is gradually overpowered by intellectuality and that men feel proud and exalted by every such advance. But we are unable to say why this should be so. It further happens later on that intellectuality itself is overpowered by the very puzzling emotional phenomenon of faith. Here we have the celebrated '*credo quia absurdum*', and, once more, anyone who has succeeded in this regards it as a supreme achievement. Perhaps the common element in all these psychological situations is something else. Perhaps men simply pronounce that what is more difficult is higher, and their pride is merely their narcissism augmented by the consciousness of a difficulty overcome.

These are certainly not very fruitful considerations, and it might be thought that they have nothing at all to do with our enquiry as to what has determined the character of the Jewish people. That would only be to our advantage; but a certain connection with our problem is betrayed nevertheless by a fact which will concern us still more later on. The religion which began with the prohibition against making an image of God develops more and more in the course of centuries into a religion of instinctual renunciations. It is not that it would demand sexual *abstinence*; it is content with a marked restriction of sexual freedom. God, however, becomes entirely removed from sexuality and elevated into the ideal of ethical perfection. But ethics is a limitation of instinct. The Prophets are never tired of asseverating that God requires nothing other from his people than a just and virtuous conduct of life - that is, abstention from every instinctual satisfaction which is still condemned as vicious by our morality to-day as well. And even the demand for belief in him seems to take a second place in comparison with the seriousness of these ethical requirements. In this way instinctual renunciation seems to play a prominent part in the religion, even if it did not stand out in it from the first.

This is the place, however, for an interpolation, in order to avoid a misunderstanding. Even though it may seem that instinctual renunciation and the ethics founded on it do not form part of the essential content of religion, yet genetically they are most intimately connected with it. Totemism, which is the earliest form of a religion which we recognize, carries with it, as indispensable constituents of its system, a number of commands and prohibitions which have no other significance, of course, than as instinctual renunciations: the worship of the totem, which includes a prohibition against injuring or killing it, exogamy - that is, renunciation of the passionately desired mothers and sisters in the horde - the granting of equal rights to all the members of the fraternal alliance - that is, restricting the inclination to violent rivalry among them. In these regulations are to be seen the first beginnings of a moral and social order. It does not escape us that two different motives are at work here. The first two prohibitions operate on the side of the father who has been got rid of: they carry on his will, as it were. The third command - the granting of equal rights to the allied brothers - disregards the father's will; it is justified by an appeal to the necessity for permanently maintaining the new order which succeeded the father's removal. Otherwise a relapse into the earlier state would have become inevitable. It is here that social commands diverge from the others which, as we might say, are derived directly from religious connections.

The essential part of this course of events is repeated in the abbreviated development of the human individual. Here, too, it is the authority of the child's parents - essentially, that of his autocratic father, threatening him with his power to punish - which calls on him for a renunciation of instinct and which decides for him what is to be allowed and what forbidden. Later on, when Society and the super-ego have taken the parents' place, what in the child was called 'well-behaved' or 'naughty' is described as 'good' and 'evil' or 'virtuous' and 'vicious'. But it is still always the same thing - instinctual renunciation under the pressure of the authority which replaces and prolongs the father.

A further depth is added to these discoveries when we examine the remarkable concept of holiness. What is it really that seems to us 'holy' in preference to other things that we value highly and recognize as important? On the one hand, the connection of holiness or sacredness with what is religious is unmistakable. It is insisted upon emphatically: everything religious is sacred, it is the very core of sacredness. On the other hand, our judgement is disturbed by the numerous attempts to apply the characteristic of sacredness to so many other things - people, institutions, functions - which have little to do with religion. These efforts serve obvious tendentious purposes. Let us start from the prohibitive character which is so firmly attached to sacredness. What is sacred is obviously something that may not be touched. A sacred prohibition has a very strong emotional tone but has in fact no rational basis. For why, for instance, should incest with a daughter or sister be such a specially serious crime - so much worse than any other sexual intercourse? If we ask for a rational basis we shall certainly be told that all our feelings rebel against it. But that only means that people regard the prohibition as self-evident and that they know of no basis for it.

It is easy enough to show the futility of such an explanation. What is represented as insulting our most sacred feelings was a universal custom - we might call it a usage made holy - among the ruling families of the Ancient Egyptians and of other early peoples. It was taken as a matter of course that a Pharaoh should take his sister as his first and principal wife; and the later successors of the Pharaohs, the Greek Ptolemies, did not hesitate to follow that model. We are compelled, rather, to a realization that incest - in this instance between a brother and sister - was a privilege which was withheld from common mortals and reserved to kings as representatives of the gods, just as similarly, no objection was taken to incestuous relations of this kind in the world of Greek and Germanic legend. It may be suspected that the scrupulous insistence upon equality of birth among our aristocracy is a relic of this ancient privilege and it can be established that, as a result of the inbreeding practised over so many generations in the highest social strata, Europe is ruled to-day by members of a single family and a second one.

Evidence of incest among gods, kings and heroes helps us as well to deal with another attempt, which seeks to explain the horror of incest biologically and to trace it to an obscure knowledge of the damage done by inbreeding. It is not even certain, however, that there *is* any danger of damage from inbreeding let alone that primitive peoples can have recognized it and reacted against it. The uncertainty in defining the permitted and forbidden degrees of kinship argues just as little in favour of the hypothesis that a 'natural feeling' is the ultimate basis of the horror of incest.

Our construction of prehistory forces us to another explanation. The command in favour of exogamy, of which the horror of incest is the negative expression, was a product of the will of the father and carried this will on after he had been removed. Hence come the strength of its emotional tone and the impossibility of finding a rational basis for it - that is, its sacredness. We confidently expect that an investigation of all the other cases of a sacred prohibition would lead to the same conclusion as in that of the horror of incest: that what is sacred was originally nothing other than the prolongation of the will of the primal father. This would also throw light on the hitherto incomprehensible ambivalence of the words which express the concept of sacredness. It is the ambivalence which in general dominates the relation to the father. [The Latin] '*sacer*' means not only 'sacred', 'consecrated', but also something that we can only translate as 'infamous', 'detestable' (e.g. '*auri sacra fames*'). But the father's will was not only something which one might not touch, which one had to hold in high respect, but also something one trembled before, because it demanded a painful instinctual renunciation. When we hear that Moses made his people holy by introducing the custom of circumcision we now understand the deep meaning of that assertion. Circumcision is the symbolic substitute for the castration which the primal father once inflicted upon his sons in the plenitude of his absolute power, and whoever accepted that symbol was showing by it that he was prepared to submit to the father's will, even if it imposed the most painful sacrifice on him.

Going back to ethics, we may say in conclusion that a part of its precepts are justified rationally by the necessity for delimiting the rights of society as against the individual, the rights of the individual as against society and those of individuals as against one another. But what seems to us so grandiose about ethics, so mysterious and, in a mystical fashion, so self-evident, owes these characteristics to its connection with religion, its origin from the will of the father.

E

WHAT IS TRUE IN RELIGION

How enviable, to those of us who are poor in faith, do those enquirers seem who are convinced of the existence of a Supreme Being! To that great Spirit the world offers no problems, for he himself created all its institutions. How comprehensive, how exhaustive and how definitive are the doctrines of believers compared with the laborious, paltry and fragmentary attempts at explanation which are the most we are able to achieve! The divine Spirit, which is itself the ideal of ethical perfection, has planted in men the knowledge of that ideal and, at the same time, the urge to assimilate their own nature to it. They perceive directly what is higher and nobler and what is lower and more base. Their affective life is regulated in accordance with their distance from the ideal at any moment. When they approach to it - at their perihelion, as it were - they are brought high satisfaction; when, at their aphelion, they have become remote from it, the punishment is severe unpleasure. All of this is laid down so simply and so unshakeably. We can only regret that certain experiences in life and observations in the world make it impossible for us to accept the premiss of the existence of such a Supreme Being. As though the world had not riddles enough, we are set the new problem of understanding how these other people have been able to acquire their belief in the Divine Being and whence that belief obtained its immense power, which overwhelms 'reason and science'.

Let us return to the more modest problem which has occupied us hitherto. We wanted to explain the origin of the special character of the Jewish people, a character which is probably what has made their survival to the present day possible. We found that the man Moses impressed this character on them by giving them a religion which increased their self-esteem so much that they thought themselves superior to all other peoples. Thereafter they survived by keeping apart from others. Mixtures of blood interfered little with this, since what held them together was an ideal factor, the possession in common of certain intellectual and emotional wealth. The religion of Moses led to this result because (1) it allowed the people to take a share in the grandeur of a new idea of God, (2) it asserted that this people had been chosen by this great God and were destined to receive evidences of his special favour and (3) it forced upon the people an advance in intellectuality which, important enough in itself, opened the way, in addition, to the appreciation of intellectual work and to further renunciations of instinct.

This is what we have arrived at. And, though we do not wish to take back any of it, we cannot hide from ourselves that it is somehow or other unsatisfying. The cause does not, so to speak, match the effect; the fact that we want to explain seems to be of a different order of magnitude from everything by which we explain it. May it be that all the investigations we have so far made have not uncovered the whole of the motivation but only a certain superficial layer, and that behind it another very important factor awaits discovery? In view of the extraordinary complexity of all causation in life and history, something of the sort was to be expected.

Access to this deeper motivation would seem to be given at a particular point in the previous discussions. The religion of Moses did not produce its effects immediately but in a remarkably indirect manner. This does not mean to say simply that it did not work at once, that it took long periods of time, hundreds of years, to deploy its full effect, for that is self-evident when it is a question of the imprinting of a people's character. But the restriction relates to a fact which we have derived from the history of the Jewish religion or, if you like, have introduced into it. We have said that after a certain time the Jewish people rejected the religion of Moses once more - whether they did so completely or retained some of its precepts we cannot guess. If we suppose that in the long period of the seizure of Canaan and the struggle with the peoples inhabiting it the Yahweh religion did not differ essentially from the worship of the other Baalim, we shall be on historical ground in spite of all the later tendentious efforts to throw a veil over this shaming state of things.

The religion of Moses, however, had not disappeared without leaving a trace. A kind of memory of it had survived, obscured and distorted, supported, perhaps, among individual members of the priestly caste by ancient records. And it was this tradition of a great past which continued to work in the background, as it were, which gradually gained more and more power over men's minds, and which finally succeeded in transforming the god Yahweh into the god of Moses and in calling back to life the religion of Moses which had been established and then abandoned long centuries earlier.

In a previous portion of this study we have considered what assumption seems inevitable if we are to find such an achievement of tradition comprehensible.

F

THE RETURN OF THE REPRESSED

There are a quantity of similar processes among those which the analytic investigation of mental life has taught us to know. Some of them are described as pathological, others are counted among the diversity of normal events. But that matters little, since the boundaries between the two are not sharply drawn, their mechanisms are to a large extent the same, and it is of far more importance whether the alterations in question take place in the ego itself or whether they confront it as alien to it - in which case they are known as symptoms.

From the mass of material I shall first bring forward some cases which relate to the development of character. Take, for instance, the girl who has reached a state of the most decided opposition to her mother. She has cultivated all those characteristics which she has seen that her mother lacked, and has avoided everything that reminded her of her mother. We may supplement this by saying that in her early years, like every female child, she adopted an identification with her mother and that she is now rebelling against this energetically. But when this girl marries and herself becomes a wife and a mother, we need not be surprised to find that she begins to grow more and more like the mother to whom she was so antagonistic, till finally the identification with her which she surmounted is unmistakably re-established. The same thing happens too with boys; and even the great Goethe, who in the period of his genius certainly looked down upon his unbending and pedantic father, in his old age developed traits which formed a part of his father's character. The outcome can become even more striking when the contrast between the two personalities is sharper. A young man whose fate it was to grow up beside a worthless father, began by developing, in defiance of him, into a capable, trustworthy and honourable person. In the prime of life his character was reversed, and thenceforward he behaved as though he had taken this same father as a model. In order not to miss the connection with our theme, we must keep in mind the fact that at the beginning of such a course of events there is always an identification with the father in early childhood. This is afterwards repudiated, and even overcompensated, but in the end establishes itself once more.

It has long since become common knowledge that the experiences of a person's first five years exercise a determining effect on his life, which nothing later can withstand. Much that deserves knowing might be said about the way in which these early impressions maintain themselves against any influences in more mature periods of life - but it would not be relevant here. It may, however, be less well known that the strongest compulsive influence arises from impressions which impinge upon a child at a time when we would have to regard his psychical apparatus as not yet completely receptive. The fact itself cannot be doubted; but it is so puzzling that we may make it more comprehensible by comparing it with a photographic exposure which can be developed after any interval of time and transformed into a picture. I am nevertheless glad to point out that this uncomfortable discovery of ours has been anticipated by an imaginative writer, with the boldness that is permitted to poets. E. T. A. Hoffmann used to trace back the wealth of figures that put themselves at his disposal for his creative writings to the changing images and impressions which he had experienced during a journey of some weeks in a post-chaise while he was still an infant at his mother's breast. What children have experienced at the age of two and have not understood, need never be remembered by them except in dreams; they may only come to know of it through psycho-analytic treatment. But at some later time it will break into their life with obsessional impulses, it will govern their actions, it will decide their sympathies and antipathies and will quite often determine their choice of a love-object, for which it is so frequently impossible to find a rational basis. The two points at which these facts touch upon our problem cannot be mistaken.

First, there is the remoteness of the period concerned,¹ which is recognized here as the truly determining factor - in the special state of the memory, for instance, which in the case of these childhood experiences we classify as 'unconscious'. We expect to find an analogy in this with the state which we are seeking to attribute to tradition in the mental life of the people. It was not easy, to be sure, to introduce the idea of the unconscious into group psychology.

¹ Here, too, a poet may speak. In order to explain his attachment, he imagines: 'Ach, du warst in abgelebten Zeiten meine Schwester oder meine Frau.' [Literally: 'Ah, you were, in a past life, my sister or my wife.']

Regular contributions are made to the phenomena we are in search of by the mechanisms which lead to the formation of neuroses. Here again the determining events occur in early childhood times, but here the stress is not upon the *time* but upon the process by which the event is met, the reaction to it. We can describe it schematically thus. As a result of the experience, an instinctual demand arises which calls for satisfaction. The ego refuses that satisfaction, either because it is paralysed by the magnitude of the demand or because it recognizes it as a danger. The former of these grounds is the more primary one; both of them amount to the avoidance of a situation of danger. The ego fends off the danger by the process of repression. The instinctual impulse is in some way inhibited, its precipitating cause, with its attendant perceptions and ideas, is forgotten. This, however, is not the end of the process: the instinct has either retained its forces, or collects them again, or it is reawakened by some new precipitating cause. Thereupon it renews its demand, and, since the path to normal satisfaction remains closed to it by what we may call the scar of repression, somewhere, at a weak spot, it opens another path for itself to what is known as a substitutive satisfaction, which comes to light as a symptom, without the acquiescence of the ego, but also without its understanding. All the phenomena of the formation of symptoms may justly be described as the 'return of the repressed'. Their distinguishing characteristic, however, is the far-reaching distortion to which the returning material has been subjected as compared with the original. It will perhaps be thought that this last group of facts has carried us too far away from the similarity with tradition. But we ought not to regret it if it has brought us close to the problems of the renunciation of instinct.

G

HISTORICAL TRUTH

We have undertaken all these psychological diversions in order to make it more credible to us that the religion of Moses only carried through its effect on the Jewish people as a tradition. It is likely that we have not achieved more than a certain degree of probability. Let us suppose, however, that we have succeeded in completely proving it. Even so the impression would remain that we have merely satisfied the *qualitative* factor of what was demanded, but not the quantitative one as well. There is an element of grandeur about everything to do with the origin of a religion, certainly including the Jewish one, and this is not matched by the explanations we have hitherto given. Some other factor must be involved to which there is little that is analogous and nothing that is of the same kind, something unique and something of the same order of magnitude as what has come out of it, as religion itself.

Let us try to approach the subject from the opposite direction. We understand how a primitive man is in need of a god as creator of the universe, as chief of his clan, as personal protector. This god takes his position behind the dead fathers, about whom tradition still has something to say. A man of later days, of our own day, behaves in the same way. He, too, remains childish and in need of protection, even when he is grown up; he thinks he cannot do without support from his god. That much is undisputed. But it is less easy to understand why there may only be a *single* god, why precisely the advance from henotheism to monotheism acquires an overwhelming significance. No doubt it is true, as we have explained, that the believer has a share in the greatness of his god; and the greater the god the more reliable is the protection which he can offer. But a god's power does not necessarily presuppose that he is the only one. Many peoples regarded it only as a glorification of their chief god if he ruled over other deities who were inferior to him, and they did not think it diminished his greatness if there were other gods besides him. No doubt, if this god became a universal one and had all countries and peoples as his concern, it meant a sacrifice of intimacy, too. It was as though one were sharing one's god with the foreigners and one had to make up for this by the proviso that one was preferred by him. We can make the further point that the idea of a single god means in itself an advance in intellectuality, but it is impossible to rate this point so highly.

Pious believers, however, know how to fill this obvious gap in motivation adequately. They say that the idea of a single god produced such an overwhelming effect on men because it is a portion of the eternal *truth* which, long concealed, came to light at last and was then bound to carry everyone along with it. We must admit that a factor of this kind is at last something that matches the magnitude both of the subject and of its effect.

We too would like to accept this solution. But we are brought up by a doubt. The pious argument rests on an optimistic and idealistic premiss. It has not been possible to demonstrate in other connections that the human intellect has a particularly fine flair for the truth or that the human mind shows any special inclination for recognizing the truth. We have rather found, on the contrary, that our intellect very easily goes astray without any warning, and that nothing is more easily believed by us than what, without reference to the truth, comes to meet our wishful illusions. We must for that reason add a reservation to our agreement. We too believe that the pious solution contains the truth - but the *historical* truth and not the *material* truth. And we assume the right to correct a certain distortion to which this truth has been subjected on its return. That is to say, we do not believe that there is a single great god to-day, but that in *primaeval* times there was a single person who was bound to appear huge at that time and who afterwards returned in men's memory elevated to divinity.

We had assumed that the religion of Moses was to begin with rejected and half-forgotten and afterwards broke through as a tradition. We are now assuming that this process was being repeated then for the second time. When Moses brought the people the idea of a single god, it was not a novelty but signified the revival of an experience in the *primaeval* ages of the human family which had long vanished from men's conscious memory. But it had been so important and had produced or paved the way for such deeply penetrating changes in men's life that we cannot avoid believing that it had left behind it in the human mind some permanent traces, which can be compared to a tradition.

We have learnt from the psycho-analyses of individuals that their earliest impressions, received at a time when the child was scarcely yet capable of speaking, produce at some time or another effects of a compulsive character without themselves being consciously remembered. We believe we have a right to make the same assumption about the earliest experiences of the whole of humanity. One of these effects would be the emergence of the idea of a single great god - an idea which must be recognized as a completely justified memory, though, it is true, one that has been distorted. An idea such as this has a compulsive character: it *must* be believed. To the extent to which it is distorted, it may be described as a *delusion*; in so far as it brings a return of the past, it must be called the *truth*. Psychiatric delusions, too, contain a small fragment of truth and the patient's conviction extends over from this truth on to its delusional wrappings.

What follows, from here to the end, is a slightly modified repetition of the discussions in Part I.

In 1912 I attempted, in my *Totem and Taboo*, to reconstruct the ancient situation from which these consequences followed. In doing so, I made use of some theoretical ideas put forward by Darwin, Atkinson and particularly by Robertson Smith, and combined them with the findings and indications derived from psycho-analysis. From Darwin I borrowed the hypothesis that human beings originally lived in small hordes, each of which was under the despotic rule of an older male who appropriated all the females and castigated or disposed of the younger males, including his sons. From Atkinson I took, in continuation of this account, the idea that this patriarchal system ended in a rebellion by the sons, who banded together against their father, overcame him and devoured him in common. Basing myself on Robertson Smith's totem theory, I assumed that subsequently the father-horde gave place to the totemic brother-clan. In order to be able to live in peace with one another, the victorious brothers renounced the women on whose account they had, after all, killed their father, and instituted exogamy. The power of fathers was broken and the families were organized as a matriarchy. The ambivalent emotional attitude of the sons to their father remained in force during the whole of later development. A particular animal was set up in the father's place as a totem. It was regarded as ancestor and protective spirit and might not be injured or killed. But once a year the whole male community came together to a ceremonial meal at which the totem animal (worshipped at all other times) was torn to pieces and devoured in common. No one might absent himself from this meal: it was the ceremonial repetition of the killing of the father, with which social order, moral laws and religion had taken their start. The conformity between Robertson Smith's totem meal and the Christian Lord's Supper had struck a number of writers before me.

To this day I hold firmly to this construction. I have repeatedly met with violent reproaches for not having altered my opinions in later editions of my book in spite of the fact that more recent ethnologists have unanimously rejected Robertson Smith's hypotheses and have in part brought forward other, totally divergent theories. I may say in reply that these ostensible advances are well known to me. But I have not been convinced either of the correctness of these innovations or of Robertson Smith's errors. A denial is not a refutation, an innovation is not necessarily an advance. Above all, however, I am not an ethnologist but a psycho-analyst. I had a right to take out of ethnological literature what I might need for the work of analysis. The writings of Robertson Smith - a man of genius - have given me valuable points of contact with the psychological material of analysis and indications for its employment. I have never found myself on common ground with his opponents.

H

THE HISTORICAL DEVELOPMENT

I cannot here repeat the contents of *Totem and Taboo* in greater detail. But I must undertake to fill up the long stretch between that hypothetical primaeval period and the victory of monotheism in historical times. After the institution of the combination of brother-clan, matriarchy, exogamy and totemism, a development began which must be described as a slow 'return if the repressed'. Here I am not using the term 'the repressed' in its proper sense. What is in question is something in a people's life which is past, lost to view, superseded and which we venture to compare with what is repressed in the mental life of an individual. We cannot at first sight say in what form this past existed during the time of its eclipse. It is not easy for us to carry over the concepts of individual psychology into group psychology; and I do not think we gain anything by introducing the concept of a 'collective' unconscious. The content of the unconscious, indeed, is in any case a collective, universal property of mankind. For the moment, then, we will make shift with the use of analogies. The processes in the life of peoples which we are studying here are very similar to those familiar to us in psychopathology, but nevertheless not quite the same. We must finally make up our minds to adopt the hypothesis that the psychical precipitates of the primaeval period became inherited property which, in each fresh generation, called not for acquisition but only for awakening. In this we have in mind the example of what is certainly the 'innate' symbolism which derives from the period of the development of speech, which is familiar to all children without their being instructed, and which is the same among all peoples despite their different languages. What we may perhaps still lack in certainty here is made good by other products of psycho-analytic research. We find that in a number of important relations our children react, not in a manner corresponding to their own experience, but instinctively, like the animals, in a manner that is only explicable as phylogenetic acquisition.

The return of the repressed took place slowly and certainly not spontaneously but under the influence of all the changes in conditions of life which fill the history of human civilization. I cannot give a survey here of these determinants nor more than a fragmentary enumeration of the stages of this return. The father once more became the head of the family, but was not by any means so absolute as the father of the primal horde had been. The totem animal was replaced by a god in a series of transitions which are still very plain. To begin with, the god in human form still bore an animal's head; later he turned himself by preference into that particular animal, and afterwards it became sacred to him and was his favourite attendant; or he killed the animal and himself bore its name as an epithet. Between the totem animal and the god, the hero emerged, often as a preliminary step towards deification. The idea of a supreme deity seems to have started early, at first only in a shadowy manner without intruding into men's daily interests. As tribes and peoples came together into larger unities, the gods too organized themselves into families and into hierarchies. One of them was often elevated into being supreme lord over gods and men. After this, the further step was hesitatingly taken of paying respect to only one god, and finally the decision was taken of giving all power to a single god and of tolerating no other gods beside him. Only thus was it that the supremacy of the father of the primal horde was re-established and that the emotions relating to him could be repeated.

The first effect of meeting the being who had so long been missed and longed for was overwhelming and was like the traditional description of the law-giving from Mount Sinai. Admiration, awe and thankfulness for having found grace in his eyes - the religion of Moses knew none but these positive feelings towards the father-god. The conviction of his irresistibility, the submission to his will, could not have been more unquestioning in the helpless and intimidated son of the father of the horde - indeed those feelings only become fully intelligible when they are transposed into the primitive and infantile setting. A child's emotional impulses are intensely and inexhaustibly deep to a degree quite other than those of an adult; only religious ecstasy can bring them back. A rapture of devotion to God was thus the first reaction to the return of the great father.

The direction to be taken by this father-religion was in this way laid down for all time. Yet this did not bring its development to an end. Ambivalence is a part of the essence of the relation to the father: in the course of time the hostility too could not fail to stir, which had once driven the sons into killing their admired and dreaded father. There was no place in the framework of the religion of Moses for a direct expression of the murderous hatred of the father. All that could come to light was a mighty reaction against it - a sense of guilt on account of that hostility, a bad conscience for having sinned against God and for not ceasing to sin. This sense of guilt, which was uninterruptedly kept awake by the Prophets, and which soon formed an essential part of the religious system, had yet another superficial motivation, which neatly disguised its true origin. Things were going badly for the people; the hopes resting on the favour of God failed in fulfilment; it was not easy to maintain the illusion, loved above all else, of being God's chosen people. If they wished to avoid renouncing that happiness, a sense of guilt on account of their own sinfulness offered a welcome means of exculpating God: they deserved no better than to be punished by him since they had not obeyed his commandments. And, driven by the need to satisfy this sense of guilt, which was insatiable and came from sources so much deeper, they must make those commandments grow ever stricter, more meticulous and even more trivial. In a fresh rapture of moral asceticism they imposed more and more new instinctual renunciations on themselves and in that way reached - in doctrine and precept, at least - ethical heights which had remained inaccessible to the other peoples of antiquity. Many Jews regard this attainment of ethical heights as the second main characteristic and the second great achievement of their religion. The way in which it was connected with the first one - the idea of a single god - should be plain from our remarks. These ethical ideas cannot, however, disavow their origin from the sense of guilt felt on account of a suppressed hostility to God. They possess the characteristic - uncompleted and incapable of completion - of obsessional neurotic reaction-formations; we can guess, too, that they serve the secret purposes of punishment.

The further development takes us beyond Judaism. The remainder of what returned from the tragic drama of the primal father was no longer reconcilable in any way with the religion of Moses. The sense of guilt of those days was very far from being any longer restricted to the Jewish people; it had caught hold of all the Mediterranean peoples as a dull *malaise*, a premonition of calamity for which no one could suggest a reason. Historians of our day speak of an ageing of ancient civilization, but I suspect that they have only grasped accidental and contributory causes of this depressed mood of the peoples. The elucidation of this situation of depression sprang from Jewry. Irrespectively of all the approximations and preparations in the surrounding world, it was after all a Jewish man, Saul of Tarsus (who, as a Roman citizen, called himself Paul), in whose spirit the realization first emerged: 'the reason we are so unhappy is that we have killed God the father.' And it is entirely understandable that he could only grasp this piece of truth in the delusional disguise of the glad tidings: 'we are freed from all guilt since one of us has sacrificed his life to absolve us.' In this formula the killing of God was of course not mentioned, but a crime that had to be atoned by the sacrifice of a victim could only have been a murder. And the intermediate step between the delusion and the historical truth was provided by the assurance that the victim of the sacrifice had been God's son. With the strength which it derived from the source of historical truth, this new faith overthrew every obstacle. The blissful sense of being chosen was replaced by the liberating sense of redemption. But the fact of the parricide, in returning to the memory of mankind, had to overcome greater resistances than the other fact, which had constituted the subject-matter of monotheism; it was also obliged to submit to a more powerful distortion. The unnameable crime was replaced by the hypothesis of what must be described as a shadowy 'original sin'.

Original sin and redemption by the sacrifice of a victim became the foundation stones of the new religion founded by Paul. It must remain uncertain whether there was a ringleader and instigator to the murder among the band of brothers who rebelled against the primal father, or whether such a figure was created later by the imagination of creative artists in order to turn themselves into heroes, and was then introduced into the tradition. After the Christian doctrine had burst the framework of Judaism, it took up components from many other sources, renounced a number of characteristics of pure monotheism and adapted itself in many details to the rituals of the other Mediterranean peoples. It was as though Egypt was taking vengeance once more on the heirs of Akhenaten. It is worth noticing how the new religion dealt with the ancient ambivalence in the relation to the father. Its main content was, it is true, reconciliation with God the Father, atonement for the crime committed against him; but the other side of the emotional relation showed itself in the fact that the son, who had taken the atonement on himself, became a god himself beside the father and, actually, in place of the father. Christianity, having arisen out of a father-religion, became a son-religion. It has not escaped the fate of having to get rid of the father.

Only a portion of the Jewish people accepted the new doctrine. Those who refused to are still called Jews to-day. Owing to this cleavage, they have become even more sharply divided from other peoples than before. They were obliged to hear the new religious community (which, besides Jews, included Egyptians, Greeks, Syrians, Romans and eventually Germans) reproach them with having murdered God. In full, this reproach would run as follows: 'They will not accept it as true that they murdered God, whereas we admit it and have been cleansed of that guilt.' It is easy therefore to see how much truth lies behind this reproach. A special enquiry would be called for to discover why it has been impossible for the Jews to join in this forward step which was implied, in spite of all its distortions, by the admission of having murdered God. In a certain sense they have in that way taken a tragic load of guilt on themselves; they have been made to pay heavy penance for it.

Our investigation may perhaps have thrown a little light on the question of how the Jewish people have acquired the characteristics which distinguish them. Less light has been thrown on the problem of how it is that they have been able to retain their individuality till the present day. But exhaustive answers to such riddles cannot in fairness be either demanded or expected. A contribution, to be judged in view of the limitations which I mentioned at the start, is all that I can offer.

AN OUTLINE OF PSYCHO-ANALYSIS
(1940)

Intentionally left blank

AN OUTLINE OF PSYCHO-ANALYSIS

The aim of this brief work is to bring together the tenets of psycho-analysis and to state them, as it were, dogmatically - in the most concise form and in the most unequivocal terms. Its intention is naturally not to compel belief or to arouse conviction.

The teachings of psycho-analysis are based on an incalculable number of observations and experiences, and only someone who has repeated those observations on himself and on others is in a position to arrive at a judgement of his own upon it.

PART I

CHAPTER I

THE PSYCHICAL APPARATUS

Psycho-analysis makes a basic assumption, the discussion of which is reserved to philosophical thought but the justification for which lies in its results. We know two kinds of things about what we call our psyche (or mental life): firstly, its bodily organ and scene of action, the brain (or nervous system) and, on the other hand, our acts of consciousness, which are immediate data and cannot be further explained by any sort of description. Everything that lies between is unknown to us, and the data do not include any direct relation between these two terminal points of our knowledge. If it existed, it would at the most afford an exact localization of the processes of consciousness and would give us no help towards understanding them.

Our two hypotheses start out from these ends or beginnings of our knowledge. The first is concerned with localization. We assume that mental life is the function of an apparatus to which we ascribe the characteristics of being extended in space and of being made up of several portions - which we imagine, that is, as resembling a telescope or microscope or something of the kind. Notwithstanding some earlier attempts in the same direction, the consistent working-out of a conception such as this is a scientific novelty.

We have arrived at our knowledge of this psychical apparatus by studying the individual development of human beings. To the oldest of these psychical provinces or agencies we give the name of *id*. It contains everything that is inherited, that is present at birth, that is laid down in the constitution - above all, therefore, the instincts, which originate from the somatic organization and which find a first psychical expression here in forms unknown to us.¹

Under the influence of the real external world around us, one portion of the *id* has undergone a special development. From what was originally a cortical layer, equipped with the organs for receiving stimuli and with arrangements for acting as a protective shield against stimuli, a special organization has arisen which henceforward acts as an intermediary between the *id* and the external world. To this region of our mind we have given the name of *ego*.

Here are the principal characteristics of the ego. In consequence of the pre-established connection between sense perception and muscular action, the *ego* has voluntary movement at its command. It has the task of self-preservation. As regards *external* events, it performs that task by becoming aware of stimuli, by storing up experiences about them (in the memory), by avoiding excessively strong stimuli (through flight), by dealing with moderate stimuli (through adaptation) and finally by learning to bring about expedient changes in the external world to its own advantage (through activity). As regards *internal* events, in relation to the *id*, it performs that task by gaining control over the demands of the instincts, by deciding whether they are to be allowed satisfaction, by postponing that satisfaction to times and circumstances favourable in the external world or by suppressing their excitations entirely. It is guided in its activity by consideration of the tensions produced by stimuli, whether these tensions are present in it or introduced into it. The raising of these tensions is in general felt as *unpleasure* and their lowering as *pleasure*. It is probable, however, that what is felt as pleasure or unpleasure is not the *absolute* height of this tension but something in the rhythm of the changes in them. The *ego* strives after pleasure and seeks to avoid unpleasure. An increase in unpleasure that is expected and foreseen is met by a *signal of anxiety*; the occasion of such an increase, whether it threatens from without or within, is known as a *danger*. From time to time the *ego* gives up its connection with the external world and withdraws into the state of sleep, in which it makes far-reaching changes in its organization. It is to be inferred from the state of sleep that this organization consists in a particular distribution of mental energy.

¹ This oldest portion of the psychical apparatus remains the most important throughout life; moreover, the investigations of psycho-analysis started with it.

The long period of childhood, during which the growing human being lives in dependence on his parents, leaves behind it as a precipitate the formation in his ego of a special agency in which this parental influence is prolonged. It has received the name of *super-ego*. In so far as this super-ego is differentiated from the ego or is opposed to it, it constitutes a third power which the ego must take into account.

An action by the ego is as it should be if it satisfies simultaneously the demands of the id, of the super-ego and of reality - that is to say, if it is able to reconcile their demands with one another. The details of the relation between the ego and the super-ego become completely intelligible when they are traced back to the child's attitude to its parents. This parental influence of course includes in its operation not only the personalities of the actual parents but also the family, racial and national traditions handed on through them, as well as the demands of the immediate social *milieu* which they represent. In the same way, the super-ego, in the course of an individual's development, receives contributions from later successors and substitutes of his parents, such as teachers and models in public life of admired social ideals. It will be observed that, for all their fundamental difference, the id and the super-ego have one thing in common: they both represent the influences of the past - the id the influence of heredity, the super-ego the influence, essentially, of what is taken over from other people - whereas the ego is principally determined by the individual's own experience, that is by accidental and contemporary events.

This general schematic picture of a psychical apparatus may be supposed to apply as well to the higher animals which resemble man mentally. A super-ego must be presumed to be present wherever, as is the case with man, there is a long period of dependence in childhood. A distinction between ego and id is an unavoidable assumption. Animal psychology has not yet taken in hand the interesting problem which is here presented.

CHAPTER II

THE THEORY OF THE INSTINCTS

The power of the id expresses the true purpose of the individual organism's life. This consists in the satisfaction of its innate needs. No such purpose as that of keeping itself alive or of protecting itself from dangers by means of anxiety can be attributed to the id. That is the task of the ego, whose business it also is to discover the most favourable and least perilous method of obtaining satisfaction, taking the external world into account. The super-ego may bring fresh needs to the fore, but its main function remains the limitation of satisfactions.

The forces which we assume to exist behind the tensions caused by the needs of the id are called *instincts*. They represent the somatic demands upon the mind. Though they are the ultimate cause of all activity, they are of a conservative nature; the state, whatever it may be, which an organism has reached gives rise to a tendency to re-establish that state so soon as it has been abandoned. It is thus possible to distinguish an indeterminate number of instincts, and in common practice this is in fact done. For us, however, the important question arises whether it may not be possible to trace all these numerous instincts back to a few basic ones. We have found that instincts can change their aim (by displacement) and also that they can replace one another - the energy of one instinct passing over to another. This latter process is still insufficiently understood. After long hesitations and vacillations we have decided to assume the existence of only two basic instincts, *Eros* and *the destructive instinct*. (The contrast between the instincts of self-preservation and the preservation of the species, as well as the contrast between ego-love and object-love, fall within *Eros*.) The aim of the first of these basic instincts is to establish ever greater unities and to preserve them thus - in short, to bind together; the aim of the second is, on the contrary, to undo connections and so to destroy things. In the case of the destructive instinct we may suppose that its final aim is to lead what is living into an inorganic state. For this reason we also call it the *death instinct*. If we assume that living things came later than inanimate ones and arose from them, then the death instinct fits in with the formula we have proposed to the effect that instincts tend towards a return to an earlier state. In the case of *Eros* (or the love instinct) we cannot apply this formula. To do so would presuppose that living substance was once a unity which had later been torn apart and was now striving towards re-union.¹

¹ Creative writers have imagined something of the sort, but nothing like it is known to us from the actual history of living substance.

In biological functions the two basic instincts operate against each other or combine with each other. Thus, the act of eating is a destruction of the object with the final aim of incorporating it, and the sexual act is an act of aggression with the purpose of the most intimate union. This concurrent and mutually opposing action of the two basic instincts gives rise to the whole variegation of the phenomena of life. The analogy of our two basic instincts extends from the sphere of living things to the pair of opposing forces - attraction and repulsion - which rule in the inorganic world.¹

Modifications in the proportions of the fusion between the instincts have the most tangible results. A surplus of sexual aggressiveness will turn a lover into a sex-murderer, while a sharp diminution in the aggressive factor will make him bashful or impotent.

There can be no question of restricting one or the other of the basic instincts to one of the provinces of the mind. They must necessarily be met with everywhere. We may picture an initial state as one in which the total available energy of Eros, which henceforward we shall speak of as 'libido', is present in the still undifferentiated ego-id and serves to neutralize the destructive tendencies which are simultaneously present. (We are without a term analogous to 'libido' for describing the energy of the destructive instinct.) At a later stage it becomes relatively easy for us to follow the vicissitudes of the libido, but this is more difficult with the destructive instinct.

¹ This picture of the basic forces or instincts, which still arouses much opposition among analysts, was already familiar to the philosopher Empedocles of Acragas.

So long as that instinct operates internally, as a death instinct, it remains silent; it only comes to our notice when it is diverted outwards as an instinct of destruction. It seems to be essential for the preservation of the individual that this diversion should occur; the muscular apparatus serves this purpose. When the super-ego is established, considerable amounts of the aggressive instinct are fixated in the interior of the ego and operate there self-destructively. This is one of the dangers to health by which human beings are faced on their path to cultural development. Holding back aggressiveness is in general unhealthy and leads to illness (to mortification). A person in a fit of rage will often demonstrate how the transition from aggressiveness that has been prevented to self-destructiveness is brought about by diverting the aggressiveness against himself: he tears his hair or beats his face with his fists, though he would evidently have preferred to apply this treatment to someone else. Some portion of self-destructiveness remains within, whatever the circumstances; till at last it succeeds in killing the individual, not, perhaps, until his libido has been used up or fixated in a disadvantageous way. Thus it may in general be suspected that the *individual* dies of his internal conflicts but that the *species* dies of its unsuccessful struggle against the external world if the latter changes in a fashion which cannot be adequately dealt with by the adaptations which the species has acquired.

It is hard to say anything of the behaviour of the libido in the id and in the super-ego. All that we know about it relates to the ego, in which at first the whole available quota of libido is stored up. We call this state absolute, primary *narcissism*. It lasts till the ego begins to cathect the ideas of objects with libido, to transform narcissistic libido into object-libido. Throughout the whole of life the ego remains the great reservoir from which libidinal cathexes are sent out to objects and into which they are also once more withdrawn, just as an amoeba behaves with its pseudopodia. It is only when a person is completely in love that the main quota of libido is transferred on to the object and the object to some extent takes the place of the ego. A characteristic of the libido which is important in life is its *mobility*, the facility with which it passes from one object to another. This must be contrasted with the *fixation* of the libido to particular objects, which often persists throughout life.

There can be no question but that the libido has somatic sources, that it streams to the ego from various organs and parts of the body. This is most clearly seen in the case of that portion of the libido which, from its instinctual aim, is described as sexual excitation. The most prominent of the parts of the body from which this libido arises are known by the name of '*erotogenic zones*', though in fact the whole body is an erotogenic zone of this kind. The greater part of what we know about Eros - that is to say, about its exponent, the libido - has been gained from a study of the sexual function, which, indeed, on the prevailing view, even if not according to our theory, coincides with Eros. We have been able to form a picture of the way in which the sexual urge, which is destined to exercise a decisive influence on our life, gradually develops out of successive contributions from a number of component instincts, which represent particular erotogenic zones.

CHAPTER III

THE DEVELOPMENT OF THE SEXUAL FUNCTION

According to the prevailing view human sexual life consists essentially in an endeavour to bring one's own genitals into contact with those of someone of the opposite sex. With this are associated, as accessory phenomena and introductory acts, kissing this extraneous body, looking at it and touching it. This endeavour is supposed to make its appearance at puberty - that is, at the age of sexual maturity - and to serve the purposes of reproduction. Nevertheless, certain facts have always been known which do not fit into the narrow framework of this view. (1) It is a remarkable fact that there are people who are only attracted by individuals of their own sex and by their genitals. (2) It is equally remarkable that there are people whose desires behave exactly like sexual ones but who at the same time entirely disregard the sexual organs or their normal use; people of this kind are known as 'perverts'. (3) And lastly it is a striking thing that some children (who are on that account regarded as degenerate) take a very early interest in their genitals and show signs of excitation in them.

It may well be believed that psycho-analysis provoked astonishment and denials when, partly on the basis of these three neglected facts, it contradicted all the popular opinions on sexuality. Its principal findings are as follows:

- (a) Sexual life does not begin only at puberty, but starts with plain manifestations soon after birth.
- (b) It is necessary to distinguish sharply between the concepts of 'sexual' and 'genital'. The former is the wider concept and includes many activities that have nothing to do with the genitals.
- (c) Sexual life includes the function of obtaining pleasure from zones of the body - a function which is subsequently brought into the service of reproduction. The two functions often fail to coincide completely.

The chief interest is naturally focused on the first of these assertions, the most unexpected of all. It has been found that in early childhood there are signs of bodily activity to which only an ancient prejudice could deny the name of sexual and which are linked to psychical phenomena that we come across later in adult erotic life - such as fixation to particular objects, jealousy, and so on. It is further found, however, that these phenomena which emerge in early childhood form part of an ordered course of development, that they pass through a regular process of increase, reaching a climax towards the end of the fifth year, after which there follows a lull. During this lull progress is at a standstill and much is unlearned and there is much recession. After the end of this period of latency, as it is called, sexual life advances once more with puberty; we might say that it has a second efflorescence. And here we come upon the fact that the onset of sexual life is *diphasic*, that it occurs in two waves - something that is unknown except in man and evidently has an important bearing on hominization.¹ It is not a matter of indifference that the events of this early period, except for a few residues, fall a victim to *infantile amnesia*. Our views on the aetiology of the neuroses and our technique of analytic therapy are derived from these conceptions; and our tracing of the developmental processes in this early period has also provided evidence for yet other conclusions.

¹ Cf. the suggestion that man is descended from a mammal which reached sexual maturity at the age of five, but that some major external influence was brought to bear on the species and at that point interrupted the straight course of development of sexuality. Other transformations in the sexual life of man as compared with that of animals might be connected with this - such as the abolition of the periodicity of the libido and the exploitation of the part played by menstruation in the relation between the sexes.

The first organ to emerge as an erotogenic zone and to make libidinal demands on the mind is, from the time of birth onwards, the mouth. To begin with, all psychological activity is concentrated on providing satisfaction for the needs of that zone. Primarily, of course, this satisfaction serves the purpose of self-preservation by means of nourishment; but physiology should not be confused with psychology. The baby's obstinate persistence in sucking gives evidence at an early stage of a need for satisfaction which, though it originates from and is instigated by the taking of nourishment, nevertheless strives to obtain pleasure independently of nourishment and for that reason may and should be termed *sexual*

During this oral phase sadistic impulses already occur sporadically along with the appearance of the teeth. Their extent is far greater in the second phase, which we describe as the sadistic-anal one, because satisfaction is then sought in aggression and in the excretory function. Our justification for including aggressive urges under the libido is based on the view that sadism is an instinctual fusion of purely libidinal and purely destructive urges, a fusion which thenceforward persists uninterruptedly.¹

The third phase is that known as the phallic one, which is, as it were, a forerunner of the final form taken by sexual life and already much resembles it. It is to be noted that it is not the genitals of both sexes that play a part at this stage, but only the male ones (the phallus). The female genitals long remain unknown: in children's attempts to understand the sexual processes they pay homage to the venerable cloacal theory - a theory which has a genetic justification.²

With the phallic phase and in the course of it the sexuality of early childhood reaches its height and approaches its dissolution. Thereafter boys and girls have different histories. Both have begun to put their intellectual activity at the service of sexual researches; both start off from the premiss of the universal presence of the penis. But now the paths of the sexes diverge. The boy enters the Oedipus phase; he begins to manipulate his penis and simultaneously has phantasies of carrying out some sort of activity with it in relation to his mother, till, owing to the combined effect of a threat of castration and the sight of the absence of a penis in females, he experiences the greatest trauma of his life and this introduces the period of latency with all its consequences. The girl, after vainly attempting to do the same as the boy, comes to recognize her lack of a penis or rather the inferiority of her clitoris, with permanent effects on the development of her character; as a result of this first disappointment in rivalry, she often begins by turning away altogether from sexual life.

¹ The question arises whether the satisfaction of purely destructive instinctual impulses can be felt as pleasure, whether pure destructiveness without any libidinal admixture occurs. Satisfaction of the death instinct remaining in the ego seems not to produce feelings of pleasure, though masochism represents a fusion which is entirely analogous to sadism.

² The occurrence of early vaginal excitations is often asserted. But it is most probable that what is in question are excitations in the clitoris - that is, in an organ analogous to the penis. This does not invalidate our right to describe the phase as phallic.

It would be a mistake to suppose that these three phases succeed one another in a clear-cut fashion. One may appear in addition to another; they may overlap one another, may be present alongside of one another. In the early phases the different component instincts set about their pursuit of pleasure independently of one another; in the phallic phase there are the beginnings of an organization which subordinates the other urges to the primacy of the genitals and signifies the start of a co-ordination of the general urge towards pleasure into the sexual function. The complete organization is only achieved at puberty, in a fourth, genital phase. A state of things is then established in which (1) some earlier libidinal cathexes are retained, (2) others are taken into the sexual function as preparatory, auxiliary acts, the satisfaction of which produces what is known as fore-pleasure, and (3) other urges are excluded from the organization, and are either suppressed altogether (repressed) or are employed in the ego in another way, forming character-traits or undergoing sublimation with a displacement of their aims.

This process is not always performed faultlessly. Inhibitions in its development manifest themselves as the many sorts of disturbance in sexual life. When this is so, we find fixations of the libido to conditions in earlier phases, whose urge, which is independent of the normal sexual aim, is described as *perversion*. One such developmental inhibition, for instance, is homosexuality when it is manifest. Analysis shows that in every case a homosexual object-tie was present and in most cases persisted in a *latent* condition. The situation is complicated by the fact that as a rule the processes necessary for bringing about a normal outcome are not completely present or absent, but *partially* present, so that the final result remains dependent on these *quantitative* relations. In these circumstances the genital organization is, it is true, attained, but it lacks those portions of the libido which have not advanced with the rest and have remained fixated to pregenital objects and aims. This weakening shows itself in a tendency, if there is an absence of genital satisfaction or if there are difficulties in the real external world, for the libido to hark back to its earlier pregenital cathexes (*regression*).

During the study of the sexual functions we have been able to gain a first, preliminary conviction, or rather a suspicion, of two discoveries which will later be found to be important over the whole of our field. Firstly, the normal and abnormal manifestations observed by us (that is, the phenomenology of the subject) need to be described from the point of view of their dynamics and economics (in our case, from the point of view of the quantitative distribution of the libido). And secondly, the aetiology of the disorders which we study is to be looked for in the individual's developmental history - that is to say, in his early life.

CHAPTER IV

PSYCHICAL QUALITIES

I have described the structure of the psychical apparatus and the energies or forces which are active in it, and I have traced in a prominent example the way in which those energies (in the main, the libido) organize themselves into a physiological function which serves the purpose of the preservation of the species. There was nothing in all this to demonstrate the quite peculiar characteristic of what is psychical, apart, of course, from the empirical fact that this apparatus and these energies are the basis of the functions which we describe as our mental life. I will now turn to something which is uniquely characteristic of what is psychical, and which, indeed, according to a very widely held opinion, coincides with it to the exclusion of all else.

The starting-point for this investigation is provided by a fact without parallel, which defies all explanation or description - the fact of consciousness. Nevertheless, if anyone speaks of consciousness we know immediately and from our most personal experience what is meant by it.¹ Many people, both inside and outside science, are satisfied with the assumption that consciousness alone is psychical; in that case nothing remains for psychology but to discriminate among psychical phenomena between perceptions, feelings, thought-processes and volitions. It is generally agreed, however, that these conscious processes do not form unbroken sequences which are complete in themselves; there would thus be no alternative left to assuming that there are physical or somatic processes which are concomitant with the psychical ones and which we should necessarily have to recognize as more complete than the psychical sequences, since some of them would have conscious processes parallel to them but others would not. If so, it of course becomes plausible to lay the stress in psychology on these somatic processes, to see in *them* the true essence of what is psychical and to look for some other assessment of the conscious processes. The majority of philosophers, however, as well as many other people, dispute this and declare that the idea of something psychical being unconscious is self-contradictory.

¹ One extreme line of thought, exemplified in the American doctrine of behaviourism, thinks it possible to construct a psychology which disregards this fundamental fact!

But that is precisely what psycho-analysis is obliged to assert, and this is its second fundamental hypothesis. It explains the supposedly somatic concomitant phenomena as being what is truly psychical, and thus in the first instance disregards the quality of consciousness. It is not alone in doing this. Some thinkers (such as Theodor Lipps, for instance) have asserted the same thing in the same words; and the general dissatisfaction with the usual view of what is psychical has resulted in an increasingly urgent demand for the inclusion in psychological thought of a concept of the unconscious, though this demand has taken such an indefinite and obscure form that it could have no influence on science.

Now it would look as though this dispute between psycho-analysis and philosophy is concerned only with a trifling matter of definition - the question whether the name 'psychical' should be applied to one or another sequence of phenomena. In fact, however, this step has become of the highest significance. Whereas the psychology of consciousness never went beyond the broken sequences which were obviously dependent on something else, the other view, which held that the psychical is unconscious in itself, enabled psychology to take its place as a natural science like any other. The processes with which it is concerned are in themselves just as unknowable as those dealt with by other sciences, by chemistry or physics, for example; but it is possible to establish the laws which they obey and to follow their mutual relations and interdependences unbroken over long stretches - in short, to arrive at what is described as an 'understanding' of the field of natural phenomena in question. This cannot be effected without framing fresh hypotheses and creating fresh concepts; but these are not to be despised as evidence of embarrassment on our part but deserve on the contrary to be appreciated as an enrichment of science. They can lay claim to the same value as approximations that belongs to the corresponding intellectual scaffolding found in other natural sciences, and we look forward to their being modified, corrected and more precisely determined as further experience is accumulated and sifted. So too it will be entirely in accordance with our expectations if the basic concepts and principles of the new science (instinct, nervous energy, etc.) remain for a considerable time no less indeterminate than those of the older sciences (force, mass, attraction, etc.).

Every science is based on observations and experiences arrived at through the medium of our psychical apparatus. But since *our* science has as its subject that apparatus itself, the analogy ends here. We make our observations through the medium of the same perceptual apparatus, precisely with the help of the breaks in the sequence of 'psychical' events: we fill in what is omitted by making plausible inferences and translating it into conscious material. In this way we construct, as it were, a sequence of conscious events complementary to the unconscious psychical processes. The relative certainty of our psychical science is based on the binding force of these inferences. Anyone who enters deeply into our work will find that our technique holds its ground against any criticism.

In the course of this work the distinctions which we describe as psychical qualities force themselves on our notice. There is no need to characterize what we call 'conscious': it is the same as the consciousness of philosophers and of everyday opinion. Everything else psychical is in our view 'the unconscious'. We are soon led to make an important division in this unconscious. Some processes become conscious easily; they may then cease to be conscious, but can become conscious once more without any trouble: as people say, they can be reproduced or remembered. This reminds us that consciousness is in general a highly fugitive state. What is conscious is conscious only for a moment. If our perceptions do not confirm this, the contradiction is only an apparent one; it is explained by the fact that the stimuli which lead to perception may persist for considerable periods, so that meanwhile the perception of them may be repeated. The whole position is made clear in connection with the conscious perception of our thought-processes: these too may persist for some time, but they may just as well pass in a flash. Everything unconscious that behaves in this way, that can thus easily exchange the unconscious state for the conscious one, is therefore preferably described as 'capable of becoming conscious' or as *preconscious*. Experience has taught us that there is hardly a psychical process, however complicated it may be, which cannot on occasion remain preconscious, even though as a rule it will, as we say, push its way forward into consciousness. There are other psychical processes and psychical material which have no such easy access to becoming conscious but must be inferred, recognized and translated into conscious form in the manner described. For such material we reserve the name of the unconscious proper.

Thus we have attributed three qualities to psychical processes: they are either conscious, preconscious or unconscious. The division between the three classes of material which possess these qualities is neither absolute nor permanent. What is preconscious becomes conscious, as we have seen, without any assistance from us; what is unconscious can, through our efforts, be made conscious, and in the process we may have a feeling that we are often overcoming very strong resistances. When we attempt to do this with someone else, we should not forget that the conscious filling-in of the gaps in his perceptions - the construction we are presenting him with - does not mean as yet that we have made the unconscious material in question conscious to him. All that is true so far is that the material is present in him in two records, once in the conscious reconstruction he has been given, and besides this in its original unconscious state. Our continued efforts usually succeed eventually in making this unconscious material conscious to him himself, as a result of which the two records are brought to coincide. The amount of effort we have to use, by which we estimate the resistance against the material becoming conscious, varies in magnitude in individual cases. For instance, what comes about in an analytic treatment as a result of our efforts can also occur spontaneously: material which is ordinarily unconscious can transform itself into preconscious material and then becomes conscious - a thing that happens to a large extent in psychotic states. From this we infer that the maintenance of certain internal resistances is a *sine qua non* of normality. A relaxation of resistances such as this, with a consequent pushing forward of unconscious material, takes place regularly in the state of sleep, and thus brings about a necessary precondition for the construction of dreams. Conversely, preconscious material can become temporarily inaccessible and cut off by resistances, as happens when something is temporarily forgotten or escapes the memory; or a preconscious thought can even be temporarily put back into the unconscious state, as seems to be a precondition in the case of jokes. We shall see that a similar transformation back of preconscious material or processes into the unconscious state plays a great part in the causation of neurotic disorders.

The theory of the three qualities of what is psychical, as described in this generalized and simplified manner, seems likely to be a source of limitless confusion rather than a help towards clarification. But it should not be forgotten that in fact it is not a theory at all but a first stock-taking of the facts of our observations, that it keeps as close to those facts as possible and does not attempt to explain them. The complications which it reveals may bring into relief the peculiar difficulties with which our investigations have to contend. It may be suspected, however, that we shall come to a closer understanding of this theory itself if we trace out the relations between the psychical qualities and the provinces or agencies of the psychical apparatus which we have postulated - though these relations too are far from being simple.

The process of something becoming conscious is above all linked with the perceptions which our sense organs receive from the external world. From the topographical point of view, therefore, it is a phenomenon which takes place in the outermost cortex of the ego. It is true that we also receive conscious information from the inside of the body - the feelings, which actually exercise a more peremptory influence on our mental life than external perceptions; moreover, in certain circumstances the sense organs themselves transmit feelings, sensations of pain, in addition to the perceptions specific to them. Since, however, these sensations (as we call them in contrast to conscious perceptions) also emanate from the terminal organs and since we regard all these as prolongations or offshoots of the cortical layer, we are still able to maintain the assertion made above. The only distinction would be that, as regards the terminal organs of sensation and feeling, the body itself would take the place of the external world.

Conscious processes on the periphery of the ego and everything else in the ego unconscious - such would be the simplest state of affairs that we might picture. And such may in fact be the state that prevails in animals. But in men there is an added complication through which internal processes in the ego may also acquire the quality of consciousness. This is the work of the function of speech, which brings material in the ego into a firm connection with mnemonic residues of visual, but more particularly of auditory, perceptions. Thenceforward the perceptual periphery of the cortical layer can be excited to a much greater extent from inside as well, internal events such as passages of ideas and thought-processes can become conscious, and a special device is called for in order to distinguish between the two possibilities - a device known as *reality-testing*. The equation 'perception = reality (external world)' no longer holds. Errors, which can now easily arise and do so regularly in dreams, are called *hallucinations*.

The inside of the ego, which comprises above all the thought-processes, has the quality of being preconscious. This is characteristic of the ego and belongs to it alone. It would not be correct, however, to think that connection with the mnemonic residues of speech is a necessary precondition of the preconscious state. On the contrary, that state is independent of a connection with them, though the presence of that connection makes it safe to infer the preconscious nature of a process. The preconscious state, characterized on the one hand by having access to consciousness and on the other hand by its connection with the speech-residues, is nevertheless something peculiar, the nature of which is not exhausted by these two characteristics. The evidence for this is the fact that large portions of the ego, and particularly of the super-ego, which cannot be denied the characteristic of preconsciousness, none the less remain for the most part unconscious in the phenomenological sense of the word. We do not know why this must be so. We shall attempt presently to attack the problem of the true nature of the preconscious.

The sole prevailing quality in the id is that of being unconscious. Id and unconscious are as intimately linked as ego and preconscious: indeed, in the former case the connection is even more exclusive. If we look back at the developmental history of an individual and of his psychical apparatus, we shall be able to perceive an important distinction in the id. Originally, to be sure, everything was id; the ego was developed out of the id by the continual influence of the external world. In the course of this slow development certain of the contents of the id were transformed into the preconscious state and so taken into the ego; others of its contents remained in the id unchanged, as its scarcely accessible nucleus. During this development, however, the young and feeble ego put back into the unconscious state some of the material it had already taken in, dropped it, and behaved in the same way to some fresh impressions which it *might* have taken in, so that these, having been rejected, could leave a trace only in the id. In consideration of its origin we speak of this latter portion of the id as *the repressed*. It is of little importance that we are not always able to draw a sharp line between these two categories of contents in the id. They coincide approximately with the distinction between what was innately present originally and what was acquired in the course of the ego's development.

Having now decided upon the topographical dissection of the psychical apparatus into an ego and an id, with which the difference in quality between preconscious and unconscious runs parallel, and having agreed that this quality is to be regarded only as an *indication* of the difference and not as its essence, a further question faces us. What, if this is so, is the true nature of the state which is revealed in the id by the quality of being unconscious and in the ego by that of being preconscious and in what does the difference between them consist?

But of that we know nothing. And the profound obscurity of the background of our ignorance is scarcely illuminated by a few glimmers of insight. Here we have approached the still shrouded secret of the nature of the psychical. We assume, as other natural sciences have led us to expect, that in mental life some kind of energy is at work; but we have nothing to go upon which will enable us to come nearer to a knowledge of it by analogies with other forms of energy. We seem to recognize that nervous or psychical energy occurs in two forms, one freely mobile and another, by comparison, bound; we speak of cathexes and hypercathexes of psychical material, and even venture to suppose that a hypercathexis brings about a kind of synthesis of different processes - a synthesis in the course of which free energy is transformed into bound energy. Further than this we have not advanced. At any rate, we hold firmly to the view that the distinction between the unconscious and the preconscious state lies in dynamic relations of this kind, which would explain how it is that, whether spontaneously or with our assistance, the one can be changed into the other.

Behind all these uncertainties, however, there lies one new fact, whose discovery we owe to psycho-analytic research. We have found that processes in the unconscious or in the id obey different laws from those in the preconscious ego. We name these laws in their totality the *primary process*, in contrast to the *secondary process* which governs the course of events in the preconscious, in the ego. In the end, therefore, the study of psychical qualities has after all proved not unfruitful.

CHAPTER V

DREAM-INTERPRETATION AS AN ILLUSTRATION

An investigation of normal, stable states, in which the frontiers of the ego are safeguarded against the id by resistances (anticathexes) and have held firm, and in which the super-ego is not distinguished from the ego, because they work together harmoniously - an investigation of that kind would teach us little. The only thing that can help us are states of conflict and uproar, when the contents of the unconscious id have a prospect of forcing their way into the ego and into consciousness and the ego puts itself once more on the defensive against this invasion. It is only under these conditions that we can make such observations as will confirm or correct our statements about the two partners. Now, our nightly sleep is precisely a state of this sort, and for that reason psychical activity during sleep, which we perceive as dreams, is our most favourable object of study. In that way, too, we avoid the familiar reproach that we base our constructions of normal mental life on pathological findings; for dreams are regular events in the life of a normal person, however much their characteristics may differ from the productions of our waking life. Dreams, as everyone knows, may be confused, unintelligible or positively nonsensical, what they say may contradict all that we know of reality, and we behave in them like insane people, since, so long as we are dreaming, we attribute objective reality to the contents of the dream.

We find our way to the understanding ('interpretation') of a dream by assuming that what we recollect as the dream after we have woken up is not the true dream-process but only a *façade* behind which that process lies concealed. Here we have our distinction between the *manifest* content of a dream and the *latent* dream-thoughts. The process which produces the former out of the latter is described as the *dream-work*. The study of the dream-work teaches us by an excellent example the way in which unconscious material from the id (originally unconscious and repressed unconscious alike) forces its way into the ego, becomes preconscious and, as a result of the ego's opposition, undergoes the changes which we know as *dream-distortion*. There are no features of a dream which cannot be explained in this way.

It is best to begin by pointing out that the formation of a dream can be provoked in two different ways. Either, on the one hand, an instinctual impulse which is ordinarily suppressed (an unconscious wish) finds enough strength during sleep to make itself felt by the ego, or, on the other hand, an urge left over from waking life, a preconscious train of thought with all the conflicting impulses attached to it, finds reinforcement during sleep from an unconscious element. In short, dreams may arise either from the id or from the ego. The mechanism of dream-formation is in both cases the same and so also is the necessary dynamic precondition. The ego gives evidence of its original derivation from the id by occasionally ceasing its functions and allowing a reversion to an earlier state of things. This is logically brought about by its breaking off its relations with the external world and withdrawing its cathexes from the sense organs. We are justified in saying that there arises at birth an instinct to return to the intra-uterine life that has been abandoned - an instinct to sleep. Sleep is a return of this kind to the womb. Since the waking ego governs motility, that function is paralysed in sleep, and accordingly a good part of the inhibitions imposed on the unconscious id become superfluous. The withdrawal or reduction of these 'anticathexes' thus allows the id what is now a harmless amount of liberty.

The evidence of the share taken by the unconscious id in the formation of dreams is abundant and convincing. (a) Memory is far more comprehensive in dreams than in waking life. Dreams bring up recollections which the dreamer has forgotten, which are inaccessible to him when he is awake. (b) Dreams make an unrestricted use of linguistic symbols, the meaning of which is for the most part unknown to the dreamer. Our experience, however, enables us to confirm their sense. They probably originate from earlier phases in the development of speech. (c) Memory very often reproduces in dreams impressions from the dreamer's early childhood of which we can definitely assert not only that they had been forgotten but that they had become unconscious owing to repression. That explains the help - usually indispensable - given us by dreams in the attempts we make during the analytic treatment of neuroses to reconstruct the dreamer's early life. (d) Furthermore, dreams bring to light material which cannot have originated either from the dreamer's adult life or from his forgotten childhood. We are obliged to regard it as part of the *archaic heritage* which a child brings with him into the world, before any experience of his own, influenced by the experiences of his ancestors. We find the counterpart of this phylogenetic material in the earliest human legends and in surviving customs. Thus dreams constitute a source of human prehistory which is not to be despised.

But what makes dreams so invaluable in giving us insight is the circumstance that, when the unconscious material makes its way into the ego, it brings its own modes of working along with it. This means that the preconscious thoughts in which the unconscious material has found its expression are handled in the course of the dream-work as though they were unconscious portions of the id; and, in the case of the alternative method of dream-formation, the preconscious thoughts which have obtained reinforcement from an unconscious instinctual impulse are brought down to the unconscious state. It is only in this way that we learn the laws which govern the passage of events in the unconscious and the respects in which they differ from the rules that are familiar to us in waking thought. Thus the dream-work is essentially an instance of the unconscious working-over of preconscious thought-processes. To take an analogy from history: invading conquerors govern a conquered country, not according to the judicial system which they find in force there, but according to their own. It is, however, an unmistakable fact that the outcome of the dream-work is a compromise. The ego-organization is not yet paralysed, and its influence is to be seen in the distortion imposed on the unconscious material and in what are often very ineffective attempts at giving the total result a form not too unacceptable to the ego (*secondary revision*). In our analogy this would be an expression of the continued resistance of the defeated people.

The laws that govern the passage of events in the unconscious, which come to light in this manner, are remarkable enough and suffice to explain most of what seems strange to us about dreams. Above all there is a striking tendency to *condensation*, an inclination to form fresh unities out of elements which in our waking thought we should certainly have kept separate. As a consequence of this, a single element of the manifest dream often stands for a whole number of latent dream-thoughts as though it were a combined allusion to all of them; and in general the compass of the manifest dream is extraordinarily small in comparison with the wealth of material from which it has sprung. Another peculiarity of the dream-work, not entirely independent of the former one, is the ease with which psychical intensities (cathexes) are *displaced* from one element to another, so that it often happens that an element which was of little importance in the dream-thoughts appears as the clearest and accordingly most important feature of the manifest dream, and, *vice versa*, that essential elements of the dream-thoughts are represented in the manifest dream only by slight allusions. Moreover, as a rule the existence of quite insignificant points in common between two elements is enough to allow the dream-work to replace one by the other in all further operations. It will easily be imagined how greatly these mechanisms of condensation and displacement can increase the difficulty of interpreting a dream and of revealing the relations between the manifest dream and the latent dream-thoughts. From the evidence of the existence of these two tendencies to condensation and displacement our theory infers that in the unconscious id the energy is in a freely mobile state and that the id sets more store by the possibility of discharging quantities of excitation than by any other consideration;¹ and our theory makes use of these two peculiarities in defining the character of the primary process we have attributed to the id.

¹ An analogy may be seen in the behaviour of a non-commissioned officer who accepts a reprimand from his superior in silence but vents his anger on the first innocent private he comes across.

The study of the dream-work has taught us many other characteristics of the processes in the unconscious which are as remarkable as they are important; but we must only mention a few of them here. The governing rules of logic carry no weight in the unconscious; it might be called the Realm of the Illogical. Urges with contrary aims exist side by side in the unconscious without any need arising for an adjustment between them. Either they have no influence whatever on each other, or, if they have, no decision is reached, but a compromise comes about which is nonsensical since it embraces mutually incompatible details. With this is connected the fact that contraries are not kept apart but treated as though they were identical, so that in the manifest dream any element may also have the meaning of its opposite. Certain philologists have found that the same held good in the most ancient languages and that contraries such as 'strong-weak', 'light-dark' and 'high-deep' were originally expressed by the same roots, until two different modifications of the primitive word distinguished between the two meanings. Residues of this original double meaning seem to have survived even in a highly developed language like Latin in its use of words such as '*altus*' ('high' and 'deep') and '*sacer*' ('sacred' and 'infamous').

In view of the complication and ambiguity of the relations between the manifest dream and the latent content lying behind it, it is of course justifiable to ask how it is at all possible to deduce the one from the other and whether all we have to go on is a lucky guess, assisted perhaps by a translation of the symbols that occur in the manifest dream. It may be said in reply that in the great majority of cases the problem can be satisfactorily solved, but only with the help of the associations provided by the dreamer himself to the elements of the manifest content. Any other procedure is arbitrary and can yield no certain result. But the dreamer's associations bring to light intermediate links which we can insert in the gap between the two and by aid of which we can reinstate the latent content of the dream and 'interpret' it. It is not to be wondered at if this work of interpretation (acting in a direction opposite to the dream-work) fails occasionally to arrive at complete certainty.

It remains for us to give a dynamic explanation of why the sleeping ego takes on the task of the dream-work at all. The explanation is fortunately easy to find. With the help of the unconscious, every dream that is in process of formation makes a demand upon the ego - for the satisfaction of an instinct, if the dream originates from the id; for the solution of a conflict, the removal of a doubt or the forming of an intention, if the dream originates from a residue of preconscious activity in waking life. The sleeping ego, however, is focused on the wish to maintain sleep; it feels this demand as a disturbance and seeks to get rid of the disturbance. The ego succeeds in doing this by what appears to be an act of compliance: it meets the demand with what is in the circumstances a harmless *fulfilment of a wish* and so gets rid of it. This replacement of the demand by the fulfilment of a wish remains the essential function of the dream-work. It may perhaps be worth while to illustrate this by three simple examples - a hunger dream, a dream of convenience and a dream prompted by sexual desire. A need for food makes itself felt in a dreamer during his sleep: he has a dream of a delicious meal and sleeps on. The choice, of course, was open to him either of waking up and eating something or of continuing his sleep. He decided in favour of the latter and satisfied his hunger by means of the dream - for the time being, at all events, for if his hunger had persisted he would have had to wake up nevertheless. Here is the second example. A sleeper had to wake up so as to be in time for his work at the hospital. But he slept on, and had a dream that he was already at the hospital - but as a patient, who has no need to get up. Or again, a desire becomes active during the night for the enjoyment of a forbidden sexual object, the wife of a friend of the sleeper. He has a dream of sexual intercourse - not, indeed, with this person but with someone else of the same name to whom he is in fact indifferent; or his struggle against the desire may find expression in his mistress remaining altogether anonymous.

Naturally, every case is not so simple. Especially in dreams which have originated from undealt-with residues of the previous day, and which have only obtained an unconscious reinforcement during the state of sleep, it is often no easy task to uncover the unconscious motive force and its wish-fulfilment; but we may assume that it is always there. The thesis that dreams are the fulfilments of wishes will easily arouse scepticism when it is remembered how many dreams have an actually distressing content or even wake the dreamer in anxiety, quite apart from the numerous dreams without any definite feeling-tone. But the objection based on anxiety dreams cannot be sustained against analysis. It must not be forgotten that dreams are invariably the product of a conflict, that they are a kind of compromise-structure. Something that is a satisfaction for the unconscious id may for that very reason be a cause of anxiety for the ego.

As the dream-work proceeds, sometimes the unconscious will press forward more successfully and sometimes the ego will defend itself with greater energy. Anxiety dreams are mostly those whose content has undergone the least distortion. If the demand made by the unconscious is too great for the sleeping ego to be in a position to fend it off by the means at its disposal, it abandons the wish to sleep and returns to waking life. We shall be taking every experience into account if we say that a dream is invariably an *attempt* to get rid of a disturbance of sleep by means of a wish-fulfilment, so that the dream is a guardian of sleep. The attempt may succeed more or less completely; it may also fail, and in that case the sleeper wakes up, apparently woken precisely by the dream. So, too, there are occasions when that excellent fellow the night-watchman, whose business it is to guard the little township's sleep, has no alternative but to sound the alarm and waken the sleeping townspeople.

I will close this discussion with a comment which will justify the length of time I have spent on the problem of the interpretation of dreams. Experience has shown that the unconscious mechanisms which we have come to know from our study of the dream-work and which gave us the explanation of the formation of dreams also help us to understand the puzzling symptoms which attract our interest to neuroses and psychoses. A conformity of such a kind cannot fail to excite high hopes in us.

PART II

THE PRACTICAL TASK

CHAPTER VI

THE TECHNIQUE OF PSYCHO-ANALYSIS

A dream, then, is a psychosis, with all the absurdities, delusions and illusions of a psychosis. A psychosis of short duration, no doubt, harmless, even entrusted with a useful function, introduced with the subject's consent and terminated by an act of his will. None the less it is a psychosis, and we learn from it that even so deep-going an alteration of mental life as this can be undone and can give place to the normal function. Is it too bold, then, to hope that it must also be possible to submit the dreaded spontaneous illnesses of mental life to our influence and bring about their cure?

We already know a number of things preliminary to such an undertaking. According to our hypothesis it is the ego's task to meet the demands raised by its three dependent relations to reality, to the id and to the super-ego - and nevertheless at the same time to preserve its own organization and maintain its own autonomy. The necessary precondition of the pathological states under discussion can only be a relative or absolute weakening of the ego which makes the fulfilment of its tasks impossible. The severest demand on the ego is probably the keeping down of the instinctual claims of the id, to accomplish which it is obliged to maintain large expenditures of energy on anticathexes. But the demands made by the super-ego too may become so powerful and so relentless that the ego may be paralysed, as it were, in the face of its other tasks. We may suspect that, in the economic conflicts which arise at this point, the id and the super-ego often make common cause against the hard-pressed ego which tries to cling to reality in order to retain its normal state. If the other two become too strong, they succeed in loosening and altering the ego's organization, so that its proper relation to reality is disturbed or even brought to an end. We have seen it happen in dreaming: when the ego is detached from the reality of the external world, it slips down, under the influence of the internal world, into psychosis.

Our plan of cure is based on these discoveries. The ego is weakened by the internal conflict and we must go to its help. The position is like that in a civil war which has to be decided by the assistance of an ally from outside. The analytic physician and the patient's weakened ego, basing themselves on the real external world, have to band themselves together into a party against the enemies, the instinctual demands of the id and the conscientious demands of the super-ego. We form a pact with each other. The sick ego promises us the most complete candour - promises, that is, to put at our disposal all the material which its self-perception yields it; we assure the patient of the strictest discretion and place at his service our experience in interpreting material that has been influenced by the unconscious. Our knowledge is to make up for his ignorance and to give his ego back its mastery over lost provinces of his mental life. This pact constitutes the analytic situation.

No sooner have we taken this step than a first disappointment awaits us, a first warning against over-confidence. If the patient's ego is to be a useful ally in our common work, it must, however hard it may be pressed by the hostile powers, have retained a certain amount of coherence and some fragment of understanding for the demands of reality. But this is not to be expected of the ego of a psychotic; it cannot observe a pact of this kind, indeed it can scarcely enter into one. It will very soon have tossed us away and the help we offer it and sent us to join the portions of the external world which no longer mean anything to it. Thus we discover that we must renounce the idea of trying our plan of cure upon psychotics - renounce it perhaps for ever or perhaps only for the time being, till we have found some other plan better adapted for them.

There is, however, another class of psychical patients who clearly resemble the psychotics very closely - the vast number of people suffering severely from neuroses. The determinants of their illness as well as its pathogenic mechanisms must be the same or at least very similar. But their ego has proved more resistant and has become less disorganized. Many of them, in spite of their maladies and the inadequacies resulting from them, have been able to maintain themselves in real life. These neurotics may show themselves ready to accept our help. We will confine our interest to *them* and see how far and by what methods we are able to 'cure' them.

With the neurotics, then, we make our pact: complete candour on one side and strict discretion on the other. This looks as though we were only aiming at the post of a secular father confessor. But there is a great difference, for what we want to hear from our patient is not only what he knows and conceals from other people; he is to tell us too what he does *not* know. With this end in view we give him a more detailed definition of what we mean by candour. We pledge him to obey the *fundamental rule* of analysis, which is henceforward to govern his behaviour towards us. He is to tell us not only what he can say intentionally and willingly, what will give him relief like a confession, but everything else as well that his self-observation yields him, everything that comes into his head, even if it is *disagreeable* for him to say it, even if it seems to him *unimportant* or actually *nonsensical*. If he can succeed after this injunction in putting his self-criticism out of action, he will present us with a mass of material - thoughts, ideas, recollections - which are already subject to the influence of the unconscious, which are often its direct derivatives, and which thus put us in a position to conjecture his repressed unconscious material and to extend, by the information we give him, his ego's knowledge of his unconscious.

But it is far from being the case that his ego is content to play the part of passively and obediently bringing us the material we require and of believing and accepting our translation of it. A number of other things happen, a few of which we might have foreseen but others of which are bound to surprise us. The most remarkable thing is this. The patient is not satisfied with regarding the analyst in the light of reality as a helper and adviser who, moreover, is remunerated for the trouble he takes and who would himself be content with some such role as that of a guide on a difficult mountain climb. On the contrary, the patient sees in him the return, the reincarnation, of some important figure out of his childhood or past, and consequently transfers on to him feelings and reactions which undoubtedly applied to this prototype. This fact of transference soon proves to be a factor of undreamt-of importance, on the one hand an instrument of irreplaceable value and on the other hand a source of serious dangers. This transference is *ambivalent*: it comprises positive (affectionate) as well as negative (hostile) attitudes towards the analyst, who as a rule is put in the place of one or other of the patient's parents, his father or mother. So long as it is positive it serves us admirably. It alters the whole analytic situation; it pushes to one side the patient's rational aim of becoming healthy and free from his ailments. Instead of it there emerges the aim of pleasing the analyst and of winning his applause and love. It becomes the true motive force of the patient's collaboration; his weak ego becomes strong; under its influence he achieves things that would ordinarily be beyond his power; he leaves off his symptoms and seems apparently to have recovered - merely for the sake of the analyst. The analyst may shamefacedly admit to himself that he set out on a difficult undertaking without any suspicion of the extraordinary powers that would be at his command.

Moreover, the relation of transference brings with it two further advantages. If the patient puts the analyst in the place of his father (or mother), he is also giving him the power which his super-ego exercises over his ego, since his parents were, as we know, the origin of his super-ego. The new super-ego now has an opportunity for a sort of *after-education* of the neurotic; it can correct mistakes for which his parents were responsible in educating him. But at this point a warning must be given against misusing this new influence. However much the analyst may be tempted to become a teacher, model and ideal for other people and to create men in his own image, he should not forget that that is not his task in the analytic relationship, and indeed that he will be disloyal to his task if he allows himself to be led on by his inclinations. If he does, he will only be repeating a mistake of the parents who crushed their child's independence by their influence, and he will only be replacing the patient's earlier dependence by a new one. In all his attempts at improving and educating the patient the analyst should respect his individuality. The amount of influence which he may legitimately allow himself will be determined by the degree of developmental inhibition present in the patient. Some neurotics have remained so infantile that in analysis too they can only be treated as children.

Another advantage of transference, too, is that in it the patient produces before us with plastic clarity an important part of his life-story, of which he would otherwise have probably given us only an insufficient account. He acts it before us, as it were, instead of reporting it to us.

And now for the other side of the situation. Since the transference reproduces the patient's relation with his parents, it takes over the ambivalence of that relation as well. It almost inevitably happens that one day his positive attitude towards the analyst changes over into the negative, hostile one. This too is as a rule a repetition of the past. His obedience to his father (if it is his father that is in question), his courting of his father's favour, had its roots in an erotic wish directed towards him. Some time or other that demand will press its way forward in the transference as well and insist on being satisfied. In the analytic situation it can only meet with frustration. Real sexual relations between patients and analysts are out of the question, and even the subtler methods of satisfaction, such as the giving of preference, intimacy and so on, are only sparingly granted by the analyst. A rejection of this kind is taken as the occasion for the change-over; probably things happened in the same way in the patient's childhood.

The therapeutic successes that occurred under the sway of the positive transference are open to the suspicion of being of a *suggestive* nature. If the negative transference gains the upper hand, they are blown away like chaff before the wind. We observe with horror that all our trouble and labour hitherto have been in vain. Indeed, what we might have regarded as a permanent intellectual gain by the patient, his understanding of psycho-analysis and his reliance on its efficacy, suddenly vanish. He behaves like a child who has no power of judgement of his own but blindly believes anyone whom he loves and no one who is a stranger to him. The danger of these states of transference evidently lies in the patient's misunderstanding their nature and taking them for fresh real experiences instead of reflections of the past. If he (or she) becomes aware of the strong erotic desire that lies concealed behind the positive transference, he believes that he has fallen passionately in love; if the transference changes over, then he feels insulted and neglected, he hates the analyst as his enemy and is ready to abandon the analysis. In both these extreme cases he has forgotten the pact that he made at the beginning of the treatment and has become useless for continuing the common work. It is the analyst's task constantly to tear the patient out of his menacing illusion and to show him again and again that what he takes to be new real life is a reflection of the past. And lest he should fall into a state in which he is inaccessible to all evidence, the analyst takes care that neither the love nor the hostility reach an extreme height. This is effected by preparing him in good time for these possibilities and by not overlooking the first signs of them. Careful handling of the transference on these lines is as a rule richly rewarded. If we succeed, as we usually can, in enlightening the patient on the true nature of the phenomena of transference, we shall have struck a powerful weapon out of the hand of his resistance and shall have converted dangers into gains. For a patient never forgets again what he has experienced in the form of transference; it carries a greater force of conviction than anything he can acquire in other ways.

We think it most undesirable if the patient *acts* outside the transference instead of remembering. The ideal conduct for our purposes would be that he should behave as normally as possible outside the treatment and express his abnormal reactions only in the transference.

The method by which we strengthen the weakened ego has as a starting-point an extending of its self-knowledge. That is not, of course, the whole story but it is a first step. The loss of such knowledge signifies for the ego a surrender of power and influence; it is the first tangible sign that it is being hemmed in and hampered by the demands of the id and the super-ego. Accordingly, the first part of the help we have to offer is intellectual work on our side and encouragement to the patient to collaborate in it. This first kind of activity, as we know, is intended to pave the way to another, more difficult, task. We shall not lose sight of the dynamic element in this task, even during its preliminary stage. We gather the material for our work from a variety of sources - from what is conveyed to us by the information given us by the patient and by his free associations, from what he shows us in his transferences, from what we arrive at by interpreting his dreams and from what he betrays by his slips or *parapraxes*. All this material helps us to make constructions about what happened to him and has been forgotten as well as about what is happening in him now without his understanding it. But in all this we never fail to make a strict distinction between *our* knowledge and *his* knowledge. We avoid telling him at once things that we have often discovered at an early stage, and we avoid telling him the whole of what we think we have discovered. We reflect carefully over when we shall impart the knowledge of one of our constructions to him and we wait for what seems to us the suitable moment - which it is not always easy to decide. As a rule we put off telling him of a construction or explanation till he himself has so nearly arrived at it that only a single step remains to be taken, though that step is in fact the decisive synthesis. If we proceeded in another way and overwhelmed him with our interpretations before he was prepared for them, our information would either produce no effect or it would provoke a violent outbreak of *resistance* which would make the progress of our work more difficult or might even threaten to stop it altogether. But if we have prepared everything properly, it often happens that the patient will at once confirm our construction and himself recollect the internal or external event which he had forgotten. The more exactly the construction coincides with the details of what has been forgotten the easier will it be for him to assent. On that particular matter *our* knowledge will then have become *his* knowledge as well.

With the mention of resistance we have reached the second and more important part of our task. We have already learnt that the ego protects itself against the invasion of undesired elements from the unconscious and repressed id by means of anticathexes, which must remain intact if it is to function normally. The more hard-pressed the ego feels, the more convulsively it clings (as though in a fright) to these anticathexes, in order to protect what remains of itself from further irruptions. But this defensive purpose does not by any means accord with the aims of our treatment. What we desire, on the contrary, is that the ego, emboldened by the certainty of our help, shall dare to take the offensive in order to reconquer what has been lost. And it is here that we become aware of the strength of these anticathexes in the form of *resistances* to our work. The ego draws back in alarm from such undertakings, which seem dangerous and threaten unpleasure; it must be constantly encouraged and soothed if it is not to fail us. This resistance, which persists throughout the whole treatment and is renewed at every fresh piece of work, is known, not quite correctly, as the *resistance due to repression*. We shall find that it is not the only one that faces us. It is interesting to notice that in this situation the party-divisions are to some extent reversed: for the ego struggles against our instigation, while the unconscious, which is ordinarily our opponent, comes to our help, since it has a natural 'upward drive' and desires nothing better than to press forward across its settled frontiers into the ego and so to consciousness. The struggle which develops, if we gain our end and can induce the ego to overcome its resistances, is carried through under our direction and with our assistance. Its outcome is a matter of indifference: whether it results in the ego accepting, after a fresh examination, an instinctual demand which it has hitherto rejected, or whether it dismisses it once more, this time for good and all. In either case a permanent danger has been disposed of, the compass of the ego has been extended and a wasteful expenditure of energy has been made unnecessary.

The overcoming of resistances is the part of our work that requires the most time and the greatest trouble. It is worth while, however, for it brings about an advantageous alteration of the ego which will be maintained independently of the outcome of the transference and will hold good in life. We have also worked simultaneously at getting rid of the alteration of the ego which had been brought about under the influence of the unconscious; for whenever we have been able to detect any of its derivatives in the ego we have pointed out their illegitimate origin and have instigated the ego to reject them. It will be remembered that it was one of the necessary preconditions of our pact of assistance that any such alteration of the ego due to the intrusion of unconscious elements should not have gone beyond a certain amount.

The further our work proceeds and the more deeply our insight penetrates into the mental life of neurotics, the more clearly two new factors force themselves on our notice, which demand the closest attention as sources of resistance. Both of them are completely unknown to the patient, neither of them could be taken into account when our pact was made; nor do they arise from the patient's ego. They may both be embraced under the single name of 'need to be ill or to suffer', but they have different origins though in other respects they are of a kindred nature. The first of these two factors is the sense of guilt or consciousness of guilt, as it is called, though the patient does not feel it and is not aware of it. It is evidently the portion of the resistance contributed by a super-ego that has become particularly severe and cruel. The patient must not become well but must remain ill, for he deserves no better. This resistance does not actually interfere with our intellectual work, but it makes it inoperative; indeed, it often allows us to remove one form of neurotic suffering, but is ready at once to replace it by another, or perhaps by some somatic illness. The sense of guilt also explains the cure or improvement of severe neuroses which we occasionally observe after real misfortunes: all that matters is that the patient should be miserable - in what way is of no consequence. The uncomplaining resignation with which such people often put up with their hard fate is most remarkable, but also revealing. In warding off this resistance we are obliged to restrict ourselves to making it conscious and attempting to bring about the slow demolition of the hostile super-ego.

It is less easy to demonstrate the existence of another resistance, our means of combating which are specially inadequate. There are some neurotics in whom, to judge by all their reactions, the instinct of self-preservation has actually been reversed. They seem to aim at nothing other than self-injury and self-destruction. It is possible too that the people who in fact do in the end commit suicide belong to this group. It is to be assumed that in such people far-reaching defusions of instinct have taken place, as a result of which there has been a liberation of excessive quantities of the destructive instinct directed inwards. Patients of this kind are not able to tolerate recovery through our treatment and fight against it with all their strength. But we must confess that this is a case which we have not yet succeeded in completely explaining.

Let us once more glance over the situation which we have reached in our attempt at bringing help to the patient's neurotic ego. That ego is no longer able to fulfil the task set it by the external world (including human society). Not all of its experiences are at its disposal, a large proportion of its store of memories have escaped it. Its activity is inhibited by strict prohibitions from the super-ego, its energy is consumed in vain attempts at fending off the demands of the id. Beyond this, as a result of continuous irruptions by the id, its organization is impaired, it is no longer capable of any proper synthesis, it is torn by mutually opposed urges, by unsettled conflicts and by unsolved doubts. To start with, we get the patient's thus weakened ego to take part in the purely intellectual work of interpretation, which aims at provisionally filling the gaps in his mental assets, and to transfer to us the authority of his super-ego; we encourage it to take up the struggle over each individual demand made by the id and to conquer the resistances which arise in connection with it. At the same time we restore order in the ego by detecting the material and urges which have forced their way in from the unconscious, and expose them to criticism by tracing them back to their origin. We serve the patient in various functions, as an authority and a substitute for his parents, as a teacher and educator; and we have done the best for him if, as analysts, we raise the mental processes in his ego to a normal level, transform what has become unconscious and repressed into preconscious material and thus return it once more to the possession of his ego. On the patient's side a few rational factors work in our favour, such as the need for recovery which has its motive in his sufferings, and the intellectual interest that we may awaken in him in the theories and revelations of psycho-analysis; but of far greater force is the positive transference with which he meets us. Fighting against us, on the other hand, are the negative transference, the ego's resistance due to repression (that is, its unpleasure at having to lay itself open to the hard work imposed on it), the sense of guilt arising from its relation to the super-ego and the need to be ill due to deep-going changes in the economics of his instincts. The share taken by the last two factors decides whether the case is to be regarded as slight or severe. Apart from these, a few other factors may be discerned as having a favourable or unfavourable bearing. A certain psychological inertia, a sluggishness of the libido, which is unwilling to abandon its fixations cannot be welcome to us; the patient's capacity for sublimating his instincts plays a large part and so does his capacity for rising above the crude life of the instincts; so, too, does the relative power of his intellectual functions.

We shall not be disappointed, but, on the contrary, we shall find it entirely intelligible, if we reach the conclusion that the final outcome of the struggle we have engaged in depends on *quantitative* relations - on the quota of energy we are able to mobilize in the patient to our advantage as compared with the sum of energy of the powers working against us. Here once again God is on the side of the big battalions. It is true that we do not always succeed in winning, but at least we can usually recognize why we have not won. Those who have been following our discussion only out of therapeutic interest will perhaps turn away in contempt after this admission. But here we are concerned with therapy only in so far as it works by psychological means; and for the time being we have no other. The future may teach us to exercise a direct influence, by means of particular chemical substances, on the amounts of energy and their distribution in the mental apparatus. It may be that there are other still undreamt-of possibilities of therapy. But for the moment we have nothing better at our disposal than the technique of psycho-analysis, and for that reason, in spite of its limitations, it should not be despised.

CHAPTER VII

AN EXAMPLE OF PSYCHO-ANALYTIC WORK

We have arrived at a general acquaintance with the psychical apparatus, with the parts, organs and agencies of which it is composed, with the forces which operate in it and with the functions allotted to its parts. The neuroses and psychoses are the states in which disturbances in the functioning of the apparatus come to expression. We have chosen the neuroses as the subjects of our study because they alone seem accessible to the psychological methods of our intervention. While we are trying to influence them, we collect observations which give us a picture of their origin and of the manner in which they arise.

I will state in advance one of our chief findings before proceeding with my description. The neuroses (unlike infectious diseases, for instance) have no specific determinants. It would be idle to seek in them for pathogenic excitants. They shade off by easy transitions into what is described as the normal; and, on the other hand, there is scarcely any state recognized as normal in which indications of neurotic traits could not be pointed out. Neurotics have approximately the same innate dispositions as other people, they have the same experiences and they have the same tasks to perform. Why is it, then, that they live so much worse and with so much greater difficulty and, in the process, suffer more feelings of unpleasure, anxiety and pain?

We need not be at a loss to find an answer to this question. Quantitative *disharmonies* are what must be held responsible for the inadequacy and sufferings of neurotics. The determining cause of all the forms taken by human mental life, is, indeed, to be sought in the reciprocal action between innate dispositions and accidental experiences. Now a particular instinct may be too strong or too weak innately, or a particular capacity may be stunted or insufficiently developed in life. On the other hand, external impressions and experiences may make demands of differing strength on different people; and what one person's constitution can deal with may prove an unmanageable task for another's. These quantitative differences will determine the variety of the results.

We shall very soon feel, however, that this explanation is unsatisfactory: it is too general, it explains too much. The aetiology put forward applies to every case of mental suffering, misery and disablement, but not every such state can be termed neurotic. The neuroses have specific characteristics, they are miseries of a particular kind. So we must after all expect to find particular causes for them. Or we may adopt the supposition that, among the tasks with which mental life has to deal, there are a few on which it can especially easily come to grief; so that the peculiarity of the phenomena of neurosis, which are often so very remarkable, would follow from this without our needing to withdraw our earlier assertions. If it remains true that the neuroses do not differ in any essential respect from the normal, their study promises to yield us valuable contributions to our knowledge of the normal. It may be that we shall thus discover the 'weak points' in a normal organization.

The supposition we have just made finds confirmation. Analytic experiences teach us that there is in fact one instinctual demand attempts to deal with which most easily fail or succeed imperfectly and that there is one period of life which comes in question exclusively or predominantly in connection with the generation of a neurosis. These two factors - the nature of the instinct and the period of life concerned - call for separate consideration, although they are closely enough connected.

We can speak with a fair degree of certainty about the part played by the period of life. It seems that neuroses are acquired only in early childhood (up to the age of six), even though their symptoms may not make their appearance till much later. The childhood neurosis may become manifest for a short time or may even be overlooked. In every case the later neurotic illness links up with the prelude in childhood. It is possible that what are known as traumatic neuroses (due to excessive fright or severe somatic shocks, such as railway collisions, burial under falls of earth, and so on) are an exception to this: their relations to determinants in childhood have hitherto eluded investigation. There is no difficulty in accounting for this aetiological preference for the first period of childhood. The neuroses are, as we know, disorders of the ego; and it is not to be wondered at if the ego, so long as it is feeble, immature and incapable of resistance, fails to deal with tasks which it could cope with later on with the utmost ease. In these circumstances instinctual demands from within, no less than excitations from the external world, operate as 'traumas', particularly if they are met half way by certain innate dispositions. The helpless ego fends them off by means of attempts at flight (*repression*), which later turn out to be inefficient and which involve permanent restrictions on further development. The damage inflicted on the ego by its first experiences gives us the appearance of being disproportionately great; but we have only to take as an analogy the differences in the results produced by the prick of a needle into a mass of cells in the act of cell-division (as in Roux's experiments) and into the fully grown animal which eventually develops out of them. No human individual is spared such traumatic experiences; none escapes the repressions to which they give rise. These questionable reactions on the part of the ego may perhaps be indispensable for the attainment of another aim which is set for the same period of life: in the space of a few years the little primitive creature must turn into a civilized human being; he must pass through an immensely long stretch of human cultural development in an almost uncannily abbreviated form. This is made possible by hereditary disposition; but it can almost never be achieved without the additional help of upbringing, of parental influence, which, as a precursor of the super-ego, restricts the ego's activity by prohibitions and punishments, and encourages or compels the setting-up of repressions. We must therefore not forget to include the influence of civilization among the determinants of neurosis. It is easy, as we can see, for a barbarian to be healthy; for a civilized man the task is hard. The desire for a powerful, uninhibited ego may seem to us intelligible; but, as we are taught by the times we live in, it is in the profoundest sense hostile to civilization. And since the demands of civilization are represented by family upbringing, we must bear in mind the part played by this biological characteristic of the human species - the prolonged period of its childhood dependence - in the aetiology of the neuroses.

As regards the other point - the specific instinctual factor - we come upon an interesting discrepancy between theory and experience. Theoretically there is no objection to supposing that any sort of instinctual demand might occasion the same repressions and their consequences; but our observation shows us invariably, so far as we can judge, that the excitations that play this pathogenic part arise from the component instincts of sexual life. The symptoms of neuroses are, it might be said, without exception either a substitutive satisfaction of some sexual urge or measures to prevent such a satisfaction; and as a rule they are compromises between the two, of the kind that come about in accordance with the laws operating between contraries in the unconscious. The gap in our theory cannot at present be filled; our decision is made more difficult by the fact that most of the urges of sexual life are not of a purely erotic nature but have arisen from alloys of the erotic instinct with portions of the destructive instinct. But it cannot be doubted that the instincts which manifest themselves physiologically as sexuality play a prominent, unexpectedly large part in the causation of the neuroses - whether it is an exclusive one remains to be decided. It must also be borne in mind that in the course of cultural development no other function has been so energetically and extensively repudiated as precisely the sexual one. Theory must rest satisfied with a few hints that betray a deeper connection: the fact that the first period of childhood, during which the ego begins to be differentiated from the id, is also the period of the early sexual efflorescence which is brought to an end by the period of latency; that it can hardly be a matter of chance that this momentous early period subsequently falls a victim to infantile amnesia; and lastly, that biological changes in sexual life (such as the function's diphasic onset which we have already mentioned, the disappearance of the periodic character of sexual excitation and the transformation in the relation between female menstruation and male excitation) - that these innovations in sexuality must have been of high importance in the evolution of animals into man. It is left for the science of the future to bring these still isolated data together into a new understanding. It is not in psychology but in biology that there is a gap here. We shall not be wrong, perhaps, in saying that the weak point in the ego's organization seems to lie in its attitude to the sexual function, as though the biological antithesis between self-preservation and the preservation of the species had found a psychological expression at that point.

Analytic experience has convinced us of the complete truth of the assertion so often to be heard that the child is psychologically father to the adult and that the events of his first years are of paramount importance for his whole later life. It will thus be of special interest to us if there is something that may be described as the central experience of this period of childhood. Our attention is first attracted by the effects of certain influences which do not apply to all children, though they are common enough - such as the sexual abuse of children by adults, their seduction by other children (brothers or sisters) slightly their seniors, and, what we should not expect, their being deeply stirred by seeing or hearing at first hand sexual behaviour between adults (their parents) mostly at a time at which one would not have thought they could either be interested in or understand any such impressions, or be capable of remembering them later. It is easy to confirm the extent to which such experiences arouse a child's susceptibility and force his own sexual urges into certain channels from which they cannot afterwards depart. Since these impressions are subjected to repression either at once or as soon as they seek to return as memories, they constitute the determinant for the neurotic compulsion which will subsequently make it impossible for the ego to control the sexual function and will probably cause it to turn away from that function permanently. If this latter reaction occurs, the result will be a neurosis; if it is absent, a variety of perversions will develop, or the function, which is of immense importance not only for reproduction but also for the entire shaping of life, will become totally unmanageable.

However instructive cases of this kind may be, a still higher degree of interest must attach to the influence of a situation which every child is destined to pass through and which follows inevitably from the factor of the prolonged period during which a child is cared for by other people and lives with his parents. I am thinking of the *Oedipus complex*, so named because its essential substance is to be found in the Greek legend of King Oedipus, which has fortunately been preserved for us in a version by a great dramatist. The Greek hero killed his father and took his mother to wife. That he did so unwittingly, since he did not know them as his parents, is a deviation from the analytic facts which we can easily understand and which, indeed, we shall recognize as inevitable.

At this point we must give separate accounts of the development of boys and girls (of males and females), for it is now that the difference between the sexes finds psychological expression for the first time. We are faced here by the great enigma of the biological fact of the duality of the sexes: it is an ultimate fact for our knowledge, it defies every attempt to trace it back to something else. Psycho-analysis has contributed nothing to clearing up this problem, which clearly falls wholly within the province of biology. In mental life we only find reflections of this great antithesis; and their interpretation is made more difficult by the fact, long suspected, that no individual is limited to the modes of reaction of a single sex but always finds some room for those of the opposite one, just as his body bears, alongside of the fully developed organs of one sex, atrophied and often useless rudiments of those of the other. For distinguishing between male and female in mental life we make use of what is obviously an inadequate empirical and conventional equation: we call everything that is strong and active male, and everything that is weak and passive female. This fact of psychological bisexuality, too, embarrasses all our enquiries into the subject and makes them harder to describe.

A child's first erotic object is the mother's breast that nourishes it; love has its origin in attachment to the satisfied need for nourishment. There is no doubt that, to begin with, the child does not distinguish between the breast and its own body; when the breast has to be separated from the body and shifted to the '*outside*' because the child so often finds it absent, it carries with it as an '*object*' a part of the original narcissistic libidinal cathexis. This first object is later completed into the person of the child's mother, who not only nourishes it but also looks after it and thus arouses in it a number of other physical sensations, pleasurable and unpleasurable. By her care of the child's body she becomes its first seducer. In these two relations lies the root of a mother's importance, unique, without parallel, established unalterably for a whole lifetime as the first and strongest love-object and as the prototype of all later love-relations - for both sexes. In all this the phylogenetic foundation has so much the upper hand over personal accidental experience that it makes no difference whether a child has really sucked at the breast or has been brought up on the bottle and never enjoyed the tenderness of a mother's care. In both cases the child's development takes the same path; it may be that in the second case its later longing grows all the greater. And for however long it is fed at its mother's breast, it will always be left with a conviction after it has been weaned that its feeding was too short and too little.

This preface is not superfluous, for it can heighten our realization of the intensity of the Oedipus complex. When a boy (from the age of two or three) has entered the phallic phase of his libidinal development, is feeling pleasurable sensations in his sexual organ and has learnt to procure these at will by manual stimulation, he becomes his mother's lover. He wishes to possess her physically in such ways as he has divined from his observations and intuitions about sexual life, and he tries to seduce her by showing her the male organ which he is proud to own. In a word, his early awakened masculinity seeks to take his father's place with her; his father has hitherto in any case been an envied model to the boy, owing to the physical strength he perceives in him and the authority with which he finds him clothed. His father now becomes a rival who stands in his way and whom he would like to get rid of. If while his father is away he is allowed to share his mother's bed and if when his father returns he is once more banished from it, his satisfaction when his father disappears and his disappointment when he emerges again are deeply felt experiences. This is the subject of the Oedipus complex, which the Greek legend has translated from the world of a child's phantasy into pretended reality. Under the conditions of our civilization it is invariably doomed to a frightening end.

The boy's mother has understood quite well that his sexual excitation relates to herself. Sooner or later she reflects that it is not right to allow it to continue. She thinks she is doing the correct thing in forbidding him to handle his genital organ. Her prohibition has little effect; at the most it brings about some modification in his method of obtaining satisfaction. At last his mother adopts the severest measures; she threatens to take away from him the thing he is defying her with. Usually, in order to make the threat more frightening and more credible, she delegates its execution to the boy's father, saying that she will tell him and that he will cut the penis off. Strange to say, this threat operates only if another condition is fulfilled before or afterwards. In itself it seems too inconceivable to the boy that such a thing could happen. But if at the time of the threat he can recall the appearance of female genitals or if shortly afterwards he has a sight of them - of genitals, that is to say, which really lack this supremely valued part, then he takes what he has heard seriously and, coming under the influence of the *castration complex*, experiences the severest trauma of his young life.¹

¹ Castration has a place too in the Oedipus legend, for the blinding with which Oedipus punishes himself after the discovery of his crime is, by the evidence of dreams, a symbolic substitute for castration. The possibility cannot be excluded that a phylogenetic memory-trace may contribute to the extraordinarily terrifying effect of the threat - a memory-trace from the prehistory of the primal family, where the jealous father actually robbed his son of his genitals if the latter became troublesome to him as a rival with a woman. The primaeval custom of circumcision, another symbolic substitute for castration, can only be understood as an expression of submission to the father's will. (Cf. the puberty rites of primitive peoples.) No investigation has yet been made of the form taken by the events described above among peoples and in civilizations which do not suppress masturbation in children.

The results of the threat of castration are multifarious and incalculable; they affect the whole of a boy's relations with his father and mother and subsequently with men and women in general. As a rule the child's masculinity is unable to stand up to this first shock. In order to preserve his sexual organ he renounces the possession of his mother more or less completely; his sexual life often remains permanently encumbered by the prohibition. If a strong feminine component, as we call it, is present in him, its strength is increased by this intimidation of his masculinity. He falls into a passive attitude to his father, such as he attributes to his mother. It is true that as a result of the threat he has given up masturbation, but not the activities of his imagination accompanying it. On the contrary, since these are now the only form of sexual satisfaction remaining to him, he indulges in them more than before and in these phantasies, though he still continues to identify himself with his father, he also does so, simultaneously and perhaps predominantly, with his mother. Derivatives and modified products of these early masturbatory phantasies usually make their way into his later ego and play a part in the formation of his character. Apart from this encouragement of his femininity, fear and hatred of his father gain greatly in intensity. The boy's masculinity withdraws, as it were, into a defiant attitude towards his father, which will dominate his later behaviour in human society in a compulsive fashion. A residue of his erotic fixation to his mother is often left in the form of an excessive dependence on her, and this persists as a kind of bondage to women. He no longer ventures to love his mother, but he cannot risk not being loved by her, for in that case he would be in danger of being betrayed by her to his father and handed over to castration. The whole experience, with all its antecedents and consequences, of which my account has only been able to give a selection, is subjected to a highly energetic repression, and, as is made possible by the laws operating in the unconscious id, all the mutually contending emotional impulses and reactions which are set going at that time are preserved in the unconscious and ready to disturb the later development of the ego after puberty. When the somatic process of sexual maturation puts fresh life into the old libidinal fixations which had apparently been surmounted, sexual life will turn out to be inhibited, without homogeneity and fallen apart into mutually conflicting urges.

It is no doubt true that the impact of the threat of castration upon a boy's budding sexual life does not always have these dreaded consequences. It will depend once again on *quantitative* relations how much damage is done and how much avoided. The whole occurrence, which may probably be regarded as the central experience of the years of childhood, the greatest problem of early life and the strongest source of later inadequacy, is so completely forgotten that its reconstruction during the work of analysis is met in adults by the most decided disbelief. Indeed, aversion to it is so great that people try to silence any mention of the proscribed subject and the most obvious reminders of it are overlooked by a strange intellectual blindness. One may hear it objected, for instance, that the legend of King Oedipus has in fact no connection with the construction made by analysis: the cases are quite different, since Oedipus did not know that it was his father that he killed and his mother that he married. What is overlooked in this is that a distortion of this kind is inevitable if an attempt is made at a poetic handling of the material, and that there is no introduction of extraneous material but only a skilful employment of the factors presented by the theme. The ignorance of Oedipus is a legitimate representation of the unconscious state into which, for adults, the whole experience has fallen; and the coercive power of the oracle, which makes or should make the hero innocent, is a recognition of the inevitability of the fate which has condemned every son to live through the Oedipus complex. Again it was pointed out from psycho-analytic quarters how easily the riddle of another dramatic hero, Shakespeare's procrastinator, Hamlet, can be solved by reference to the Oedipus complex, since the prince came to grief over the task of punishing someone else for what coincided with the substance of his own Oedipus wish - whereupon the general lack of understanding on the part of the literary world showed how ready is the mass of mankind to hold fast to its infantile repressions.¹

Yet more than a century before the emergence of psycho-analysis the French philosopher Diderot bore witness to the importance of the Oedipus complex by expressing the difference between the primitive and civilized worlds in this sentence: 'Si le petit sauvage était abandonné à lui-même, qu'il conservât toute son imbécillité, et qu'il réunît au peu de raison de l'enfant au berceau la violence des passions de l'homme de trente ans, il tordrait le col à son père et coucherait avec sa mère.'² I venture to say that if psycho-analysis could boast of no other achievement than the discovery of the repressed Oedipus complex, that alone would give it a claim to be included among the precious new acquisitions of mankind.

¹ The name 'William Shakespeare' is very probably a pseudonym behind which a great unknown lies concealed. Edward de Vere, Earl of Oxford, a man who has been thought to be identifiable with the author of Shakespeare's works, lost a beloved and admired father while he was still a boy and completely repudiated his mother, who contracted a new marriage very soon after her husband's death.

² ['If the little savage were left to himself, preserving all his foolishness and adding to the small sense of a child in the cradle the violent passions of a man of thirty, he would strangle his father and lie with his mother.']

The effects of the castration complex in little girls are more uniform and no less profound. A female child has, of course, no need to fear the loss of a penis; she must, however, react to the fact of not having received one. From the very first she envies boys its possession; her whole development may be said to take place under the colours of envy for the penis. She begins by making vain attempts to do the same as boys and later, with greater success, makes efforts to compensate for her defect - efforts which may lead in the end to a normal feminine attitude. If during the phallic phase she tries to get pleasure like a boy by the manual stimulation of her genitals, it often happens that she fails to obtain sufficient satisfaction and extends her judgement of inferiority from her stunted penis to her whole self. As a rule she soon gives up masturbating, since she has no wish to be reminded of the superiority of her brother or playmate, and turns away from sexuality altogether.

If a little girl persists in her first wish - to grow into a boy - in extreme cases she will end as a manifest homosexual, and otherwise she will exhibit markedly masculine traits in the conduct of her later life, will choose a masculine vocation, and so on. The other path leads by way of abandoning the mother she has loved: the daughter, under the influence of her envy for the penis, cannot forgive her mother for having sent her into the world so insufficiently equipped. In her resentment over this she gives up her mother and puts someone else in her place as the object of her love - her father. If one has lost a love-object, the most obvious reaction is to identify oneself with it, to replace it from within, as it were, by identification. This mechanism now comes to the little girl's help. Identification with her mother can take the place of attachment to her mother. The little daughter puts herself in her mother's place, as she has always done in her games; she tries to take her mother's place with her father, and begins to hate the mother she used to love, and from two motives: from jealousy as well as from mortification over the penis she has been denied. Her new relation to her father may start by having as its content a wish to have his penis at her disposal, but it culminates in another wish - to have a baby from him as a gift. The wish for a baby has thus taken the place of the wish for a penis, or has at all events split off from it.

It is an interesting thing that the relation between the Oedipus complex and the castration complex should take such a different shape - an opposite one, in fact - in the case of females as compared to that of males. In males, as we have seen, the threat of castration brings the Oedipus complex to an end; in females we find that, on the contrary, it is their lack of a penis that forces them into their Oedipus complex. It does little harm to a woman if she remains in her feminine Oedipus attitude. (The term 'Electra complex' has been proposed for it.) She will in that case choose her husband for his paternal characteristics and be ready to recognize his authority. Her longing to possess a penis, which is in fact unappeasable, may find satisfaction if she can succeed in completing her love for the organ by extending it to the bearer of the organ, just as happened earlier when she progressed from her mother's breast to her mother as a whole person.

If we ask an analyst what his experience has shown to be the mental structures least accessible to influence in his patients, the answer will be: in a woman her wish for a penis, in a man his feminine attitude towards his own sex, a precondition of which would, of course, be the loss of his penis.

PART III

THE THEORETICAL YIELD

CHAPTER VIII

THE PSYCHICAL APPARATUS AND THE EXTERNAL WORLD

All of the general discoveries and hypotheses which I brought forward in the first chapter were, of course, arrived at by laborious and patient detailed work of the kind of which I have given an example in the previous chapter. We may now feel tempted to make a survey of the increases in knowledge that we have achieved by work such as this and to consider what paths we have opened for further advances. In this connection we may be struck by the fact that we have so often been obliged to venture beyond the frontiers of the science of psychology. The phenomena with which we were dealing do not belong to psychology alone; they have an organic and biological side as well, and accordingly in the course of our efforts at building up psycho-analysis we have also made some important biological discoveries and have not been able to avoid framing new biological hypotheses.

But let us for the moment keep to psychology. We have seen that it is not scientifically feasible to draw a line of demarcation between what is psychically normal and abnormal; so that that distinction, in spite of its practical importance, possesses only a conventional value. We have thus established a right to arrive at an understanding of the normal life of the mind from a study of its disorders - which would not be admissible if these pathological states, neuroses and psychoses, had specific causes operating in the manner of foreign bodies.

The study of a mental disorder occurring during sleep, which is transient and harmless and which, indeed, performs a useful function, has given us a key to the understanding of the mental diseases which are permanent and injurious to life. And we may now venture on the assertion that the psychology of consciousness was no better capable of understanding the normal functioning of the mind than of understanding dreams. The data of conscious self-perception, which alone were at its disposal, have proved in every respect inadequate to fathom the profusion and complexity of the processes of the mind, to reveal their interconnections and so to recognize the determinants of their disturbances.

The hypothesis we have adopted of a psychical apparatus extended in space, expediently put together, developed by the exigencies of life, which gives rise to the phenomena of consciousness only at one particular point and under certain conditions - this hypothesis has put us in a position to establish psychology on foundations similar to those of any other science, such, for instance, as physics. In our science as in the others the problem is the same: behind the attributes (qualities) of the object under examination which are presented directly to our perception, we have to discover something else which is more independent of the particular receptive capacity of our sense organs and which approximates more closely to what may be supposed to be the real state of affairs. We have no hope of being able to reach the latter itself, since it is evident that everything new that we have inferred must nevertheless be translated back into the language of our perceptions, from which it is simply impossible for us to free ourselves. But herein lies the very nature and limitation of our science. It is as though we were to say in physics: 'If we could see clearly enough we should find that what appears to be a solid body is made up of particles of such and such a shape and size and occupying such and such relative positions.' In the meantime we try to increase the efficiency of our sense organs to the furthest possible extent by artificial aids; but it may be expected that all such efforts will fail to affect the ultimate outcome. Reality will always remain 'unknowable'. The yield brought to light by scientific work from our primary sense perceptions will consist in an insight into connections and dependent relations which are present in the external world, which can somehow be reliably reproduced or reflected in the internal world of our thought and a knowledge of which enables us to 'understand' something in the external world, to foresee it and possibly to alter it. Our procedure in psycho-analysis is quite similar. We have discovered technical methods of filling up the gaps in the phenomena of our consciousness, and we make use of those methods just as a physicist makes use of experiment. In this manner we infer a number of processes which are in themselves 'unknowable' and interpolate them in those that are conscious to us. And if, for instance, we say: 'At this point an unconscious memory intervened', what that means is: 'At this point something occurred of which we are totally unable to form a conception, but which, if it had entered our consciousness, could only have been described in such and such a way.'

Our justification for making such inferences and interpolations and the degree of certainty attaching to them of course remain open to criticism in each individual instance; and it cannot be denied that it is often extremely difficult to arrive at a decision - a fact which finds expression in the lack of agreement among analysts. The novelty of the problem is to blame for this - that is to say, a lack of training. But there is besides this a special factor inherent in the subject itself; for in psychology, unlike physics, we are not always concerned with things which can only arouse a cool scientific interest. Thus we shall not be very greatly surprised if a woman analyst who has not been sufficiently convinced of the intensity of her own wish for a penis also fails to attach proper importance to that factor in her patients. But such sources of error, arising from the personal equation, have no great importance in the long run. If one looks through old text-books on the use of the microscope, one is astonished to find the extraordinary demands which were made on the personality of those who made observations with that instrument while its technique was still young - of all of which there is no question to-day.

I cannot undertake to attempt a complete picture here of the psychical apparatus and its activities; I should find myself hindered, among other things, by the circumstance that psycho-analysis has not yet had time to study all those functions equally. I shall therefore content myself with a detailed recapitulation of the account in my opening chapter.

The core of our being, then, is formed by the obscure *id*, which has no direct communication with the external world and is accessible even to our own knowledge only through the medium of another agency. Within this *id* the organic *instincts* operate, which are themselves compounded of fusions of two primal forces (Eros and destructiveness) in varying proportions and are differentiated from one another by their relation to organs or systems of organs. The one and only urge of these instincts is towards satisfaction, which is expected to arise from certain changes in the organs with the help of objects in the external world. But immediate and unheeding satisfaction of the instincts, such as the *id* demands, would often lead to perilous conflicts with the external world and to extinction. The *id* knows no solicitude about ensuring survival and no anxiety; or it would perhaps be more correct to say that, though it can generate the sensory elements of anxiety, it cannot make use of them. The processes which are possible in and between the assumed psychical elements in the *id* (the *primary process*) differ widely from those which are familiar to us through conscious perception in our intellectual and emotional life; nor are they subject to the critical restrictions of logic, which repudiates some of these processes as invalid and seeks to undo them.

The id, cut off from the external world, has a world of perception of its own. It detects with extraordinary acuteness certain changes in its interior, especially oscillations in the tension of its instinctual needs, and these changes become conscious as feelings in the pleasure-unpleasure series. It is hard to say, to be sure, by what means and with the help of what sensory terminal organs these perceptions come about. But it is an established fact that self-perceptions - coenaesthetic feelings and feelings of pleasure-unpleasure - govern the passage of events in the id with despotic force. The id obeys the inexorable pleasure principle. But not the id alone. It seems that the activity of the other psychical agencies too is able only to modify the pleasure principle but not to nullify it; and it remains a question of the highest theoretical importance, and one that has not yet been answered, when and how it is ever possible for the pleasure principle to be overcome. The consideration that the pleasure principle demands a reduction, at bottom the extinction perhaps, of the tensions of instinctual needs (that is, *Nirvana*) leads to the still unassessed relations between the pleasure principle and the two primal forces, Eros and the death instinct.

The other agency of the mind, which we believe we know best and in which we recognize ourselves most easily - what is known as the *ego* - has been developed out of the id's cortical layer, which, through being adapted to the reception and exclusion of stimuli, is in direct contact with the external world (*reality*). Starting from conscious perception it has subjected to its influence ever larger regions and deeper strata of the id, and, in the persistence with which it maintains its dependence on the external world, it bears the indelible stamp of its origin (as it might be 'Made in Germany'). Its psychological function consists in raising the passage in the id to a higher dynamic level (perhaps by transforming freely mobile energy into bound energy, such as corresponds to the preconscious state); its constructive function consists in interpolating, between the demand made by an instinct and the action that satisfies it, the activity of thought which, after taking its bearings in the present and assessing earlier experiences, endeavours by means of experimental actions to calculate the consequences of the course of action proposed. In this way the ego comes to a decision on whether the attempt to obtain satisfaction is to be carried out or postponed or whether it may not be necessary for the demand by the instinct to be suppressed altogether as being dangerous. (Here we have the *reality principle*.) Just as the id is directed exclusively to obtaining pleasure, so the ego is governed by considerations of safety. The ego has set itself the task of self-preservation, which the id appears to neglect. It makes use of the sensations of anxiety as a signal to give a warning of dangers that threaten its integrity. Since memory traces can become conscious just as perceptions do, especially through their association with residues of speech, the possibility arises of a confusion which would lead to a mistaking of reality. The ego guards itself against this possibility by the institution of *reality-testing*, which is allowed to fall into abeyance in dreams on account of the conditions prevailing in the state of sleep. The ego, which seeks to maintain itself in an environment of overwhelming mechanical forces, is threatened by dangers which come in the first instance from external reality; but dangers do not threaten it from there alone. Its own id is a source of similar dangers, and that for two different reasons. In the first place, an excessive strength of instinct can damage the ego in a similar way to an excessive 'stimulus' from the external world. It is true that the former cannot destroy it; but it can destroy its characteristic dynamic organization and change the ego back into a portion of the id. In the second place, experience may have taught the ego that the satisfaction of some instinctual demand which is not in itself intolerable would involve dangers in the external world, so that an instinctual demand of that kind itself becomes a danger. Thus the ego is fighting on two fronts: it has to defend its existence against an external world which threatens it with annihilation as well as against an internal world that makes excessive demands. It adopts the same methods of defence against both, but its defence against the internal enemy is particularly inadequate. As a result of having originally been identical with this latter enemy and of having lived with it since on the most intimate terms, it has great difficulty in escaping from the internal dangers. They persist as threats, even if they can be temporarily held down.

We have heard how the weak and immature ego of the first period of childhood is permanently damaged by the stresses put upon it in its efforts to fend off the dangers that are peculiar to that period of life. Children are protected against the dangers that threaten them from the external world by the solicitude of their parents; they pay for this security by a fear of *loss of love* which would deliver them over helpless to the dangers of the external world. This factor exerts a decisive influence on the outcome of the conflict when a boy finds himself in the situation of the Oedipus complex, in which the threat to his narcissism by the danger of castration, reinforced from *primaevae* sources, takes possession of him. Driven by the combined operation of these two influences, the contemporary real danger and the remembered one with its phylogenetic basis, the child embarks on his attempts at defence - repressions - which are effective for the moment but nevertheless turn out to be psychologically inadequate when the later re-animation of sexual life brings a reinforcement to the instinctual demands which have been repudiated in the past. If this is so, it would have to be said from a biological standpoint that the ego comes to grief over the task of mastering the excitations of the early sexual period, at a time when its immaturity makes it incompetent to do so. It is in this lagging of ego development behind libidinal development that we see the essential precondition of neurosis; and we cannot escape the conclusion that neuroses could be avoided if the childish ego were spared this task - if, that is to say, the child's sexual life were allowed free play, as happens among many primitive peoples. It may be that the aetiology of neurotic illnesses is more complicated than we have here described it; if so, we have at least brought out one essential part of the aetiological complex. Nor should we forget the phylogenetic influences, which are represented in some way in the id in forms that we are not yet able to grasp, and which must certainly act upon the ego more powerfully in that early period than later. On the other hand, the realization dawns on us that such an early attempt at damming up the sexual instinct, so decided a partisanship by the young ego in favour of the external as opposed to the internal world, brought about by the prohibition of infantile sexuality, cannot be without its effect on the individual's later readiness for culture. The instinctual demands forced away from direct satisfaction are compelled to enter on new paths leading to substitutive satisfaction, and in the course of these *détours* they may become desexualized and their connection with their original instinctual aims may become looser. And at this point we may anticipate the thesis that many of the highly valued assets of our civilization were acquired at the cost of sexuality and by the restriction of sexual motive forces.

We have repeatedly had to insist on the fact that the ego owes its origin as well as the most important of its acquired characteristics to its relation to the real external world. We are thus prepared to assume that the ego's pathological states, in which it most approximates once again to the id, are founded on a cessation or slackening of that relation to the external world. This tallies very well with what we learn from clinical experience - namely, that the precipitating cause of the outbreak of a psychosis is either that reality has become intolerably painful or that the instincts have become extraordinarily intensified - both of which, in view of the rival claims made on the ego by the id and the external world, must lead to the same result. The problem of psychoses would be simple and perspicuous if the ego's detachment from reality could be carried through completely. But that seems to happen only rarely or perhaps never. Even in a state so far removed from the reality of the external world as one of hallucinatory confusion, one learns from patients after their recovery that at the time in some corner of their mind (as they put it) there was a normal person hidden, who, like a detached spectator, watched the hubbub of illness go past him. I do not know if we may assume that this is so in general, but I can report the same of other psychoses with a less tempestuous course. I call to mind a case of chronic paranoia in which after each attack of jealousy a dream conveyed to the analyst a correct picture of the precipitating cause, free from any delusion. An interesting contrast was thus brought to light: while we are accustomed to discover from the dreams of neurotics jealousies which are alien to their waking lives, in this psychotic case the delusion which dominated the patient in the day-time was corrected by his dream. We may probably take it as being generally true that what occurs in all these cases is a psychical *split*. Two psychical attitudes have been formed instead of a single one - one, the normal one, which takes account of reality, and another which under the influence of the instincts detaches the ego from reality. The two exist alongside of each other. The issue depends on their relative strength. If the second is or becomes the stronger, the necessary precondition for a psychosis is present. If the relation is reversed, then there is an apparent cure of the delusional disorder. Actually it has only retreated into the unconscious - just as numerous observations lead us to believe that the delusion existed ready-made for a long time before its manifest irruption.

The view which postulates that in all psychoses there is a *splitting of the ego* could not call for so much notice if it did not turn out to apply to other states more like the neuroses and, finally, to the neuroses themselves. I first became convinced of this in cases *fetishism*. This abnormality, which may be counted as one of the perversions, is, as is well known, based on the patient (who is almost always male) not recognizing the fact that females have no penis - a fact which is extremely undesirable to him since it is a proof of the possibility of his being castrated himself. He therefore disavows his own sense-perception which showed him that the female genitals lack a penis and holds fast to the contrary conviction. The disavowed perception does not, however, remain entirely without influence for, in spite of everything, he has not the courage to assert that he actually saw a penis. He takes hold of something else instead - a part of the body or some other object - and assigns it the role of the penis which he cannot do without. It is usually something that he in fact saw at the moment at which he saw the female genitals, or it is something that can suitably serve as a symbolic substitute for the penis. Now it would be incorrect to describe this process when a fetish is constructed as a splitting of the ego; it is a compromise formed with the help of displacement, such as we have been familiar with in dreams. But our observations show us still more. The creation of the fetish was due to an intention to destroy the evidence for the possibility of castration, so that fear of castration could be avoided. If females, like other living creatures, possess a penis, there is no need to tremble for the continued possession of one's own penis. Now we come across fetishists who have developed the same fear of castration as non-fetishists and react in the same way to it. Their behaviour is therefore simultaneously expressing two contrary premisses. On the one hand they are disavowing the fact of their perception - the fact that they saw no penis in the female genitals; and on the other hand they are recognizing the fact that females have no penis and are drawing the correct conclusions from it. The two attitudes persist side by side throughout their lives without influencing each other. Here is what may rightly be called a splitting of the ego. This circumstance also enables us to understand how it is that fetishism is so often only partially developed. It does not govern the choice of object exclusively but leaves room for a greater or lesser amount of normal sexual behaviour; sometimes, indeed, it retires into playing a modest part or is limited to a mere hint. In fetishists, therefore, the detachment of the ego from the reality of the external world has never succeeded completely.

It must not be thought that fetishism presents an exceptional case as regards a splitting of the ego; it is merely a particularly favourable subject for studying the question. Let us return to our thesis that the childish ego, under the domination of the real world, gets rid of undesirable instinctual demands by what are called repressions. We will now supplement this by further asserting that, during the same period of life, the ego often enough finds itself in the position of fending off some demand from the external world which it feels distressing and that this is effected by means of a *disavowal* of the perceptions which bring to knowledge this demand from reality. Disavowals of this kind occur very often and not only with fetishists; and whenever we are in a position to study them they turn out to be half-measures, incomplete attempts at detachment from reality. The disavowal is always supplemented by an acknowledgement; two contrary and independent attitudes always arise and result in the situation of there being a splitting of the ego. Once more the issue depends on which of the two can seize hold of the greater intensity.

The facts of this splitting of the ego, which we have just described, are neither so new nor so strange as they may at first appear. It is indeed a universal characteristic of neuroses that there are present in the subject's mental life, as regards some particular behaviour, two different attitudes, contrary to each other and independent of each other. In the case of neuroses, however, one of these attitudes belongs to the ego and the contrary one, which is repressed, belongs to the id. The difference between this case and the other is essentially a topographical or structural one, and it is not always easy to decide in an individual instance with which of the two possibilities one is dealing. They have, however, the following important characteristic in common. Whatever the ego does in its efforts of defence, whether it seeks to disavow a portion of the real external world or whether it seeks to reject an instinctual demand from the internal world, its success is never complete and unqualified. The outcome always lies in two contrary attitudes, of which the defeated, weaker one, no less than the other, leads to psychical complications. In conclusion, it is only necessary to point out how little of all these processes becomes known to us through our conscious perception.

CHAPTER IX

THE INTERNAL WORLD

We have no way of conveying knowledge of a complicated set of simultaneous events except by describing them successively; and thus it happens that all our accounts are at fault to begin with owing to one-sided simplification and must wait till they can be supplemented, built on to, and so set right.

The picture of an ego which mediates between the id and the external world, which takes over the instinctual demands of the former in order to lead them to satisfaction, which derives perceptions from the latter and uses them as memories, which, intent on its self-preservation, puts itself in defence against excessively strong claims from both sides and which, at the same time, is guided in all its decisions by the injunctions of a modified pleasure principle - this picture in fact applies to the ego only up to the end of the first period of childhood, till about the age of five. At about that time an important change has taken place. A portion of the external world has, at least partially, been abandoned as an object and has instead, by identification, been taken into the ego and thus become an integral part of the internal world. This new psychical agency continues to carry on the functions which have hitherto been performed by the people in the external world: it observes the ego, gives it orders, judges it and threatens it with punishments, exactly like the parents whose place it has taken. We call this agency the *super-ego* and are aware of it in its judicial functions as our *conscience*. It is a remarkable thing that the super-ego often displays a severity for which no model has been provided by the real parents, and moreover that it calls the ego to account not only for its deeds but equally for its thoughts and unexecuted intentions, of which the super-ego seems to have knowledge. This reminds us that the hero of the Oedipus legend too felt guilty for his deeds and submitted himself to self-punishment, although the coercive power of the oracle should have acquitted him of guilt in our judgement and his own. The super-ego is in fact the heir to the Oedipus complex and is only established after that complex has been disposed of. For that reason its excessive severity does not follow a real model but corresponds to the strength of the defence used against the temptation of the Oedipus complex. Some suspicion of this state of things lies, no doubt, at the bottom of the assertion made by philosophers and believers that the moral sense is not instilled into men by education or acquired by them in their social life but is implanted in them from a higher source.

So long as the ego works in full harmony with the super-ego it is not easy to distinguish between their manifestations; but tensions and estrangements between them make themselves very plainly visible. The torments caused by the reproaches of conscience correspond precisely to a child's fear of loss of love, a fear the place of which has been taken by the moral agency. On the other hand, if the ego has successfully resisted a temptation to do something which would be objectionable to the super-ego, it feels raised in its self-esteem and strengthened in its pride, as though it had made some precious acquisition. In this way the super-ego continues to play the part of an external world for the ego, although it has become a portion of the internal world. Throughout later life it represents the influence of a person's childhood, of the care and education given him by his parents and of his dependence on them - a childhood which is prolonged so greatly in human beings by a family life in common. And in all this it is not only the personal qualities of these parents that is making itself felt, but also everything that had a determining effect on them themselves, the tastes and standards of the social class in which they lived and the innate dispositions and traditions of the race from which they sprang. Those who have a liking for generalizations and sharp distinctions may say that the external world, in which the individual finds himself exposed after being detached from his parents, represents the power of the present; that his id, with its inherited trends, represents the organic past; and that the super-ego, which comes to join them later, represents more than anything the cultural past, which a child has, as it were, to repeat as an after-experience during the few years of his early life. It is unlikely that such generalizations can be universally correct. Some portion of the cultural acquisitions have undoubtedly left a precipitate behind them in the id; much of what is contributed by the super-ego will awaken an echo in the id; not a few of the child's new experiences will be intensified because they are repetitions of some primaeval phylogenetic experience.

'Was du ererbt von deinen Vätern hast,
Erwirb es, um es zu besitzen.'¹

Thus the super-ego takes up a kind of intermediate position between the id and the external world; it unites in itself the influences of the present and the past. In the establishment of the super-ego we have before us, as it were, an example of the way in which the present is changed into the past. . . .

ANALYSIS TERMINABLE AND INTERMINABLE

I

Experience has taught us that psycho-analytic therapy - the freeing of someone from his neurotic symptoms, inhibitions and abnormalities of character - is a time-consuming business. Hence, from the very first, attempts have been made to shorten the duration of analyses. Such endeavours required no justification; they could claim to be based on the strongest considerations of reason and expediency. But there was probably still at work in them as well some trace of the impatient contempt with which the medical science of an earlier day regarded the neuroses as being uncalled-for consequences of invisible injuries. If it had now become necessary to attend to them, they should at least be disposed of as quickly as possible.

A particularly energetic attempt in this direction was made by Otto Rank, following upon his book, *The Trauma of Birth* (1924). He supposed that the true source of neurosis was the act of birth, since this involves the possibility of a child's 'primal fixation' to his mother not being surmounted but persisting as a 'primal repression'. Rank hoped that if this primal trauma were dealt with by a subsequent analysis the whole neurosis would be got rid of. Thus this one small piece of analytic work would save the necessity for all the rest. And a few months should be enough to accomplish this. It cannot be disputed that Rank's argument was bold and ingenious; but it did not stand the test of critical examination. Moreover, it was a child of its time, conceived under the stress of the contrast between the post-war misery of Europe and the 'prosperity' of America, and designed to adapt the tempo of analytic therapy to the haste of American life. We have not heard much about what the implementation of Rank's plan has done for cases of sickness. Probably not more than if the fire-brigade, called to deal with a house that had been set on fire by an overturned oil-lamp, contented themselves with removing the lamp from the room in which the blaze had started. No doubt a considerable shortening of the brigade's activities would be effected by this means. The theory and practice of Rank's experiment are now things of the past - no less than American 'prosperity' itself.

I myself had adopted another way of speeding up an analytic treatment even before the war. At that time I had taken on the case of a young Russian, a man spoilt by wealth, who had come to Vienna in a state of complete helplessness, accompanied by a private doctor and an attendant.¹ In the course of a few years it was possible to give him back a large amount of his independence, to awaken his interest in life and to adjust his relations to the people most important to him. But there progress came to a stop. We advanced no further in clearing up the neurosis of his childhood, on which his later illness was based, and it was obvious that the patient found his present position highly comfortable and had no wish to take any step forward which would bring him nearer to the end of his treatment. It was a case of the treatment inhibiting itself: it was in danger of failing as a result of its - partial - success. In this predicament I resorted to the heroic measure of fixing a time limit for the analysis. At the beginning of a year's work I informed the patient that the coming year was to be the last one of his treatment, no matter what he achieved in the time still left to him. At first he did not believe me, but once he was convinced that I was in deadly earnest, the desired change set in. His resistances shrank up, and in these last months of his treatment he was able to reproduce all the memories and to discover all the connections which seemed necessary for understanding his early neurosis and mastering his present one. When he left me in the midsummer of 1914, with as little suspicion as the rest of us of what lay so shortly ahead, I believed that his cure was radical and permanent.

¹ See my paper published with the patient's consent, 'From the History of an Infantile Neurosis' (1918*b*). It contains no detailed account of the young man's adult illness, which is touched on only when its connection with his infantile neurosis absolutely requires it.

In a footnote added to this patient's case history in 1923, I have already reported that I was mistaken. When, towards the end of the war, he returned to Vienna, a refugee and destitute, I had to help him to master a part of the transference which had not been resolved. This was accomplished in a few months, and I was able to end my footnote with the statement that 'since then the patient has felt normal and has behaved unexceptionably, in spite of the war having robbed him of his home, his possessions, and all his family relationships'. Fifteen years have passed since then without disproving the truth of this verdict; but certain reservations have become necessary. The patient has stayed on in Vienna and has kept a place in society, if a humble one. But several times during this period his good state of health has been interrupted by attacks of illness which could only be construed as offshoots of his perennial neurosis. Thanks to the skill of one of my pupils, Dr. Ruth Mack Brunswick, a short course of treatment has on each occasion brought these conditions to an end. I hope that Dr. Mack Brunswick herself will shortly report on the circumstances. Some of these attacks were still concerned with residual portions of the transference; and, where this was so, short-lived though they were, they showed a distinctly paranoid character. In other attacks, however, the pathogenic material consisted of pieces of the patient's childhood history, which had not come to light while I was analysing him and which now came away - the comparison is unavoidable - like sutures after an operation, or small fragments of necrotic bone. I have found the history of this patient's recovery scarcely less interesting than that of his illness.

I have subsequently employed this fixing of a time-limit in other cases as well, and I have also taken the experiences of other analysts into account. There can be only one verdict about the value of this blackmailing device: it is effective provided that one hits the right time for it. But it cannot guarantee to accomplish the task completely. On the contrary, we may be sure that, while part of the material will become accessible under the pressure of the threat, another part will be kept back and thus become buried, as it were, and lost to our therapeutic efforts. For once the analyst has fixed the time-limit he cannot extend it; otherwise the patient would lose all faith in him. The most obvious way out would be for the patient to continue his treatment with another analyst, although we know that such a change will involve a fresh loss of time and abandoning fruits of work already done. Nor can any general rule be laid down as to the right time for resorting to this forcible technical device; the decision must be left to the analyst's tact. A miscalculation cannot be rectified. The saying that a lion only springs once must apply here.

II

The discussion of the technical problem of how to accelerate the slow progress of an analysis leads us to another, more deeply interesting question: is there such a thing as a natural end to an analysis - is there any possibility at all of bringing an analysis to such an end? To judge by the common talk of analysts it would seem to be so, for we often hear them say, when they are deploring or excusing the recognized imperfections of some fellow-mortal: 'His analysis was not finished' or 'he was never analysed to the end.'

We must first of all decide what is meant by the ambiguous phrase 'the end of an analysis'. From a practical standpoint it is easy to answer. An analysis is ended when the analyst and the patient cease to meet each other for the analytic session. This happens when two conditions have been approximately fulfilled: first, that the patient shall no longer be suffering from his symptoms and shall have overcome his anxieties and his inhibitions; and secondly, that the analyst shall judge that so much repressed material has been made conscious, so much that was unintelligible has been explained, and so much internal resistance conquered, that there is no need to fear a repetition of the pathological processes concerned. If one is prevented by external difficulties from reaching this goal, it is better to speak of an *incomplete* analysis rather than of an *unfinished* one.

The other meaning of the 'end' of an analysis is much more ambitious. In this sense of it, what we are asking is whether the analyst has had such a far-reaching influence on the patient that no further change could be expected to take place in him if his analysis were continued. It is as though it were possible by means of analysis to attain to a level of absolute psychical normality - a level, moreover, which we could feel confident would be able to remain stable, as though, perhaps, we had succeeded in resolving every one of the patient's repressions and in filling in all the gaps in his memory. We may first consult our experience to enquire whether such things do in fact happen, and then turn to our theory to discover whether there is any *possibility* of their happening.

Every analyst will have treated a few cases which have had this gratifying outcome. He has succeeded in clearing up the patient's neurotic disturbance, and it has not returned and has not been replaced by any other such disturbance. Nor are we without some insight into the determinants of these successes. The patient's ego had not been noticeably altered and the aetiology of his disturbance had been essentially traumatic. The aetiology of every neurotic disturbance is, after all, a mixed one. It is a question either of the instincts being excessively strong - that is to say, recalcitrant to taming by the ego - or of the effects of early (i.e. premature) traumas which the immature ego was unable to master. As a rule there is a combination of both factors, the constitutional and the accidental. The stronger the constitutional factor, the more readily will a trauma lead to a fixation and leave behind a developmental disturbance; the stronger the trauma, the more certainly will its injurious effects become manifest even when the instinctual situation is normal. There is no doubt that an aetiology of the traumatic sort offers by far the more favourable field for analysis. Only when a case is a predominantly traumatic one will analysis succeed in doing what it is so superlatively able to do; only then will it, thanks to having strengthened the patient's ego, succeed in replacing by a correct solution the inadequate decision made in his early life. Only in such cases can one speak of an analysis having been definitively ended. In them, analysis has done all that it should and does not need to be continued. It is true that, if the patient who has been restored in this way never produces another disorder calling for analysis, we do not know how much his immunity may not be due to a kind fate which has spared him ordeals that are too severe.

A constitutional strength of instinct and an unfavourable alteration of the ego acquired in its defensive struggle in the sense of its being dislocated and restricted - these are the factors which are prejudicial to the effectiveness of analysis and which may make its duration interminable. One is tempted to make the first factor - strength of instinct - responsible as well for the emergence of the second - the alteration of the ego; but it seems that the latter too has an aetiology of its own. And, indeed, it must be admitted that our knowledge of these matters is as yet insufficient. They are only now becoming the subject of analytic study. In this field the interest of analysts seems to me to be quite wrongly directed. Instead of an enquiry into how a cure by analysis comes about (a matter which I think has been sufficiently elucidated) the question should be asked of what are the obstacles that stand in the way of such a cure.

This brings me to two problems which arise directly out of analytic practice, as I hope to show by the following examples. A certain man, who had himself practised analysis with great success, came to the conclusion that his relations both to men and women - to the men who were his competitors and to the woman whom he loved - were nevertheless not free from neurotic impediments; and he therefore made himself the subject of an analysis by someone else whom he regarded as superior to himself. This critical illumination of his own self had a completely successful result. He married the woman he loved and turned into a friend and teacher of his supposed rivals. Many years passed in this way, during which his relations with his former analyst also remained unclouded. But then, for no assignable external reason, trouble arose. The man who had been analysed became antagonistic to the analyst and reproached him for having failed to give him a complete analysis. The analyst, he said, ought to have known and to have taken into account the fact that a transference-relation can never be purely positive; he should have given his attention to the possibilities of a negative transference. The analyst defended himself by saying that, at the time of the analysis, there was no sign of a negative transference. But even if he had failed to observe some very faint signs of it - which was not altogether ruled out, considering the limited horizon of analysis in those early days - it was still doubtful, he thought, whether he would have had the power to activate a topic (or, as we say, a 'complex') by merely pointing it out, so long as it was not currently active in the patient himself at the time. To activate it would certainly have required some unfriendly piece of behaviour in reality on the analyst's part. Furthermore, he added, not every good relation between an analyst and his subject during and after analysis was to be regarded as a transference; there were also friendly relations which were based on reality and which proved to be viable.

I now pass on to my second example, which raises the same problem. An unmarried woman, no longer young, had been cut off from life since puberty by an inability to walk, owing to severe pains in the legs. Her condition was obviously of a hysterical nature, and it had defied many kinds of treatment. An analysis lasting three-quarters of a year removed the trouble and restored to the patient, an excellent and worthy person, her right to a share in life. In the years following her recovery she was consistently unfortunate. There were disasters in her family, and financial losses, and, as she grew older, she saw every hope of happiness in love and marriage vanish. But the one-time invalid stood up to all this valiantly and was a support to her family in difficult times. I cannot remember whether it was twelve or fourteen years after the end of her analysis that, owing to profuse haemorrhages, she was obliged to undergo a gynaecological examination. A myoma was found, which made a complete hysterectomy advisable. From the time of this operation, the woman became ill once more. She fell in love with her surgeon, wallowed in masochistic phantasies about the fearful changes in her inside - phantasies with which she concealed her romance - and proved inaccessible to a further attempt at analysis. She remained abnormal to the end of her life. The successful analytic treatment took place so long ago that we cannot expect too much from it; it was in the earliest years of my work as an analyst. No doubt the patient's second illness may have sprung from the same source as her first one which had been successfully overcome: it may have been a different manifestation of the same repressed impulses, which the analysis had only incompletely resolved. But I am inclined to think that, were it not for the new trauma, there would have been no fresh outbreak of neurosis.

These two examples, which have been purposely selected from a large number of similar ones, will suffice to start a discussion of the topics we are considering. The sceptical, the optimistic and the ambitious will take quite different views of them. The first will say that it is now proved that even a successful analytic treatment does not protect the patient, who at the time has been cured, from falling ill later on of another neurosis - for, indeed, of a neurosis derived from the same instinctual root - that is to say, from a recurrence of his old trouble. The others will consider that this is not proved. They will object that the two examples date from the early days of analysis, twenty and thirty years ago, respectively; and that since then we have acquired deeper insight and wider knowledge, and that our technique has changed in accordance with our new discoveries. To-day, they will say, we may demand and expect that an analytic cure shall prove permanent, or at least that if a patient falls ill again, his new illness shall not turn out to be a revival of his earlier instinctual disturbance, manifesting itself in new forms. Our experience, they will maintain, does not oblige us to restrict so materially the demands that can be made upon our therapeutic method.

My reason for choosing these two examples is, of course, precisely because they lie so far back in the past. It is obvious that the more recent the successful outcome of an analysis is, the less utilizable it is for our discussion, since we have no means of predicting what the later history of the recovery will be. The optimists' expectations clearly presuppose a number of things which are not precisely self-evident. They assume, firstly, that there really is a possibility of disposing of an instinctual conflict (or, more correctly, a conflict between the ego and an instinct) definitively and for all time; secondly, that while we are treating someone for one instinctual conflict we can, as it were, inoculate him against the possibility of any other such conflicts; and thirdly, that we have the power, for purposes of prophylaxis, to stir up a pathogenic conflict of this sort which is not betraying itself at the time by any indications, and that it is wise to do so. I throw out these questions without proposing to answer them now. Perhaps it may not be possible at present to give any certain answer to them at all.

Some light may probably be thrown on them by theoretical considerations. But another point has already become clear: if we wish to fulfil the more exacting demands upon analytic therapy, our road will not lead us to, or by way of, a shortening of its duration.

III

An analytic experience which now extends over several decades, and a change which has taken place in the nature and mode of my activity, encourage me to attempt to answer the questions before us. In earlier days I treated quite a large number of patients, who, as was natural, wanted to be dealt with as quickly as possible. Of late years I have been mainly engaged in training analyses; a relatively small number of severe cases of illness remained with me for continuous treatment, interrupted, however, by longer or shorter intervals. With them, the therapeutic aim was no longer the same. There was no question of shortening the treatment; the purpose was radically to exhaust the possibilities of illness in them and to bring about a deep-going alteration of their personality.

Of the three factors which we have recognized as being decisive for the success or otherwise of analytic treatment - the influence of traumas, the constitutional strength of the instincts and alterations of the ego - what concerns us here is only the second, the strength of the instincts. A moment's reflection raises a doubt whether the restrictive use of the adjective 'constitutional' (or 'congenital') is essential. However true it may be that the constitutional factor is of decisive importance from the very beginning, it is nevertheless conceivable that a reinforcement of instinct coming later in life might produce the same effects. If so, we should have to modify our formula and say 'the strength of the instincts *at the time*' instead of 'the *constitutional* strength of the instincts'. The first of our questions was: 'Is it possible by means of analytic therapy to dispose of a conflict between an instinct and the ego, or of a pathogenic instinctual demand upon the ego, permanently and definitively?' To avoid misunderstanding it is not unnecessary, perhaps, to explain more exactly what is meant by 'permanently disposing of an instinctual demand'. Certainly not 'causing the demand to disappear so that nothing more is ever heard from it again'. This is in general impossible, nor is it at all to be desired. No, we mean something else, something which may be roughly described as a 'taming' of the instinct. That is to say, the instinct is brought completely into the harmony of the ego, becomes accessible to all the influences of the other trends in the ego and no longer seeks to go its independent way to satisfaction. If we are asked by what methods and means this result is achieved, it is not easy to find an answer. We can only say: 'So muss denn doch die Hexe dran!' - the Witch Metapsychology. Without metapsychological speculation and theorizing - I had almost said 'phantasying' - we shall not get another step forward. Unfortunately, here as elsewhere, what our Witch reveals is neither very clear nor very detailed. We have only a single clue to start from - though it is a clue of the highest value - namely, the antithesis between the primary and the secondary processes; and to that antithesis I shall at this point turn.

If now we take up our first question once more, we find that our new line of approach inevitably leads us to a particular conclusion. The question was whether it is possible to dispose of an instinctual conflict permanently and definitively - i.e. to 'tame' an instinctual demand in that fashion. Formulated in these terms, the question makes no mention at all of the strength of the instinct; but it is precisely on this that the outcome depends. Let us start from the assumption that what analysis achieves for neurotics is nothing other than what normal people bring about for themselves without its help. Everyday experience, however, teaches us that in a normal person any solution of an instinctual conflict only holds good for a particular strength of instinct, or, more correctly, only for a particular relation between the strength of the instinct and the strength of the ego.¹ If the strength of the ego diminishes, whether through illness or exhaustion, or from some similar cause, all the instincts which have so far been successfully tamed may renew their demands and strive to obtain substitutive satisfactions in abnormal ways.² Irrefutable proof of this statement is supplied by our nightly dreams; they react to the sleeping attitude assumed by the ego with an awakening of instinctual demands.

¹ Or, to be perfectly accurate, where that relation falls within certain limits.

² Here we have a justification of the claim to aetiological importance of such non-specific factors as overwork, shock, etc. These factors have always been assured of general recognition, but have had to be pushed into the background precisely by psycho-analysis. It is impossible to define health except in metapsychological terms: i.e. by reference to the dynamic relations between the agencies of the mental apparatus which have been recognized - or (if that is preferred) inferred or conjectured - by us.

The material on the other side is equally unambiguous. Twice in the course of individual development certain instincts are considerably reinforced: at puberty, and, in women, at the menopause. We are not in the least surprised if a person who was not neurotic before becomes so at these times. When his instincts were not so strong, he succeeded in taming them; but when they are reinforced he can no longer do so. The repressions behave like dams against the pressure of water. The same effects which are produced by these two physiological reinforcements of instinct, may be brought about in an irregular fashion by accidental causes at any other period of life. Such reinforcements may be set up by fresh traumas, enforced frustrations, or the collateral influence of instincts upon one another. The result is always the same, and it underlines the irresistible power of the quantitative factor in the causation of illness.

I feel as though I ought to be ashamed of so much ponderous exposition, seeing that everything I have said has long been familiar and self-evident. It is a fact that we have always behaved as if we knew all this; but, for the most part, our theoretical concepts have neglected to attach the same importance to the *economic* line of approach as they have to the *dynamic* and *topographical* ones. My excuse is therefore that I am drawing attention to this neglect.

Before we decide on an answer to this question, however, we must consider an objection whose force lies in the fact that we are probably predisposed in its favour. Our arguments, it will be said, are all deduced from the processes which take place spontaneously between the ego and the instincts, and they presuppose that analytic therapy can accomplish nothing which does not, under favourable and normal conditions, occur of itself. But is this really so? Is it not precisely the claim of our theory that analysis produces a state which never does arise spontaneously in the ego and that this newly created state constitutes the essential difference between a person who has been analysed and a person who has not? Let us bear in mind what this claim is based on. All repressions take place in early childhood; they are primitive defensive measures taken by the immature, feeble ego. In later years no fresh repressions are carried out; but the old ones persist, and their services continue to be made use of by the ego for mastering the instincts. New conflicts are disposed of by what we call 'after-repression'. We may apply to these infantile repressions our general statement that repressions depend absolutely and entirely on the relative strength of the forces involved and that they cannot hold out against an increase in the strength of the instincts. Analysis, however, enables the ego, which has attained greater maturity and strength, to undertake a revision of these old repressions; a few are demolished, while others are recognized but constructed afresh out of more solid material. These new dams are of quite a different degree of firmness from the earlier ones; we may be confident that they will not give way so easily before a rising flood of instinctual strength. Thus the real achievement of analytic therapy would be the subsequent correction of the original process of repression, a correction which puts an end to the dominance of the quantitative factor.

Thus far our theory, which we cannot give up except under irresistible compulsion. And what does our *experience* have to say to this? Perhaps our experience is not yet wide enough for us to come to a settled conclusion. It confirms our expectations often enough, but not always. One has an impression that one ought not to be surprised if it should turn out in the end that the difference between a person who has not been analysed and the behaviour of a person after he has been analysed is not so thorough-going as we aim at making it and as we expect and maintain it to be. If this is so, it would mean that analysis *sometimes* succeeds in eliminating the influence of an increase in instinct, but not invariably, or that the effect of analysis is limited to increasing the power of resistance of the inhibitions, so that they are equal to much greater demands than before the analysis or if no analysis had taken place. I really cannot commit myself to a decision on this point, nor do I know whether a decision is possible at the present time.

There is, however, another angle from which we can approach this problem of the variability in the effect of analysis. We know that the first step towards attaining intellectual mastery of our environment is to discover generalizations, rules and laws which bring order into chaos. In doing this we simplify the world of phenomena; but we cannot avoid falsifying it, especially if we are dealing with processes of development and change. What we are concerned with is discerning a *qualitative* alteration, and as a rule in doing so we neglect, at any rate to begin with, a *quantitative* factor. In the real world, transitions and intermediate stages are far more common than sharply differentiated opposite states. In studying developments and changes we direct our attention solely to the outcome; we readily overlook the fact that such processes are usually more or less incomplete - that is to say, that they are in fact only partial alterations. A shrewd satirist of old Austria, Johann Nestroy, once said: 'Every step forward is only half as big as it looks at first.' It is tempting to attribute a quite general validity to this malicious dictum. There are nearly always residual phenomena, a partial hanging-back. When an open-handed Maecenas surprises us by some isolated trait of miserliness, or when a person who is consistently over-kind suddenly indulges in a hostile action, such 'residual phenomena' are invaluable for genetic research. They show us that these praiseworthy and precious qualities are based on compensation and overcompensation which, as was to have been expected, have not been absolutely and fully successful. Our first account of the development of the libido was that an original oral phase gave way to a sadistic-anal phase and that this was in turn succeeded by a phallic-genital one. Later research has not contradicted this view, but it has corrected it by adding that these replacements do not take place all of a sudden but gradually, so that portions of the earlier organization always persist alongside of the more recent one, and even in normal development the transformation is never complete and residues of earlier libidinal fixations may still be retained in the final configuration. The same thing is to be seen in quite other fields. Of all the erroneous and superstitious beliefs of mankind that have supposedly been surmounted there is not one whose residues do not live on among us to-day in the lower strata of civilized peoples or even in the highest strata of cultural society. What has once come to life clings tenaciously to its existence. One feels inclined to doubt sometimes whether the dragons of primaeval days are really extinct.

Applying these remarks to our present problem, I think that the answer to the question of how to explain the variable results of our analytic therapy might well be that we, too, in endeavouring to replace repressions that are insecure by reliable ego-syntonic controls, do not always achieve our aim to its full extent - that is, do not achieve it thoroughly enough. The transformation is achieved, but often only partially: portions of the old mechanisms remain untouched by the work of analysis. It is difficult to prove that this is really so; for we have no other way of judging what happens but by the outcome which we are trying to explain. Nevertheless, the impressions one receives during the work of analysis do not contradict this assumption; indeed, they seem rather to confirm it. But we must not take the clarity of our own insight as a measure of the conviction which we produce in the patient. His conviction may lack 'depth', as one might say; it is always a question of the quantitative factor, which is so easily overlooked. If this is the correct answer to our question, we may say that analysis, in claiming to cure neuroses by ensuring control over instinct, is always right in theory but not always right in practice. And this is because it does not always succeed in ensuring to a sufficient degree the foundations on which a control of instinct is based. The cause of such a partial failure is easily discovered. In the past, the quantitative factor of instinctual strength opposed the ego's defensive efforts; for that reason we called in the work of analysis to help; and now that same factor sets a limit to the efficacy of this new effort. If the strength of the instinct is excessive, the mature ego, supported by analysis, fails in its task, just as the helpless ego failed formerly. Its control over instinct is improved, but it remains imperfect because the transformation in the defensive mechanism is only incomplete. There is nothing surprising in this, since the power of the instruments with which analysis operates is not unlimited but restricted, and the final upshot always depends on the relative strength of the psychological agencies which are struggling with one another.

No doubt it is desirable to shorten the duration of analytic treatment, but we can only achieve our therapeutic purpose by increasing the power of analysis to come to the assistance of the ego. Hypnotic influence seemed to be an excellent instrument for our purposes; but the reasons for our having to abandon it are well known. No substitute for hypnosis has yet been found. From this point of view we can understand how such a master of analysis as Ferenczi came to devote the last years of his life to therapeutic experiments, which, unhappily, proved to be vain.

IV

The two further questions - whether, while we are treating one instinctual conflict, we can protect a patient from future conflicts, and whether it is feasible and expedient, for prophylactic purposes, to stir up a conflict which is not at the time manifest - must be treated together; for obviously the first task can only be carried out in so far as the second one is - that is, in so far as a possible future conflict is turned into an actual present one upon which influence is then brought to bear. This new way of stating the problem is at bottom only an extension of the earlier one. Whereas in the first instance we were considering how to guard against a return of the same conflict, we are now considering how to guard against its possible replacement by *another* conflict. This sounds a very ambitious proposal, but all we are trying to do is to make clear what limits are set to the efficacy of analytic therapy.

However much our therapeutic ambition may be tempted to undertake such tasks, experience flatly rejects the notion. If an instinctual conflict is not a currently active one, is not manifesting itself, we cannot influence it even by analysis. The warning that we should let sleeping dogs lie, which we have so often heard in connection with our efforts to explore the psychical underworld, is peculiarly inapposite when applied to the conditions of mental life. For if the instincts are causing disturbances, it is a proof that the dogs are not sleeping; and if they seem really to be sleeping, it is not in our power to awaken them. This last statement, however, does not seem to be quite accurate and calls for a more detailed discussion. Let us consider what means we have at our disposal for turning an instinctual conflict which is at the moment latent into one which is currently active. Obviously there are only two things that we can do. We can bring about situations in which the conflict does become currently active, or we can content ourselves with discussing it in the analysis and pointing out the possibility of its arising. The first of these two alternatives can be carried out in two ways: in reality, or in the transference - in either case by exposing the patient to a certain amount of real suffering through frustration and the damming up of libido. Now it is true that we already make use of a technique of this kind in our ordinary analytic procedure. What would otherwise be the meaning of the rule that analysis must be carried out 'in a state of frustration'? But this is a technique which we use in treating a conflict which is already currently active. We seek to bring this conflict to a head, to develop it to its highest pitch, in order to increase the instinctual force available for its solution. Analytic experience has taught us that the better is always the enemy of the good and that in every phase of the patient's recovery we have to fight against his inertia, which is ready to be content with an incomplete solution.

If, however, what we are aiming at is a prophylactic treatment of instinctual conflicts that are not currently active but merely potential, it will not be enough to regulate sufferings which are already present in the patient and which he cannot avoid. We should have to make up our minds to provoke fresh sufferings in him; and this we have hitherto quite rightly left to fate. We should receive admonitions from all sides against the presumption of vying with fate in subjecting poor human creatures to such cruel experiments. And what sort of experiments would they be? Could we, for purposes of prophylaxis, take the responsibility of destroying a satisfactory marriage, or causing a patient to give up a post upon which his livelihood depends? Fortunately, we never find ourselves in the position of having to consider whether such interventions in the patient's real life are justified; we do not possess the plenary powers which they would necessitate, and the subject of our therapeutic experiment would certainly refuse to co-operate in it. In practice, then, such a procedure is virtually excluded; but there are, besides, theoretical objections to it. For the work of analysis proceeds best if the patient's pathogenic experiences belong to the past, so that his ego can stand at a distance from them. In states of acute crisis analysis is to all intents and purposes unusable. The ego's whole interest is taken up by the painful reality and it withholds itself from analysis, which is attempting to go below the surface and uncover the influences of the past. To create a fresh conflict would thus only be to make the work of analysis longer and more difficult.

It will be objected that these remarks are quite unnecessary. Nobody thinks of purposely conjuring up new situations of suffering in order to make it possible for a latent instinctual conflict to be treated. This would not be much to boast of as a prophylactic achievement. We know, for instance, that a patient who has recovered from scarlet fever is immune to a return of the same illness; yet it never occurs to a doctor to take a healthy person who may possibly fall ill of scarlet fever and infect him with scarlet fever in order to make him immune to it. The protective measure must not produce the same situation of danger as is produced by the illness itself, but only something very much slighter, as is the case with vaccination against small-pox and many other similar procedures. In analytic prophylaxis against instinctual conflicts, therefore, the only methods which come into consideration are the other two which we have mentioned: the artificial production of new conflicts in the transference (conflicts which, after all, lack the character of reality), and the arousing of such conflicts in the patient's imagination by talking to him about them and making him familiar with their possibility.

I do not know whether we can assert that the first of these two milder procedures is altogether ruled out in analysis. No experiments have been particularly made in this direction. But difficulties at once suggest themselves, which do not throw a very promising light on such an undertaking. In the first place, the choice of such situations for the transference is very limited. The patients cannot themselves bring all their conflicts into the transference; nor is the analyst able to call out all their possible instinctual conflicts from the transference situation. He may make them jealous or cause them to experience disappointments in love; but no technical purpose is required to bring this about. Such things happen of themselves in any case in most analyses. In the second place, we must not overlook the fact that all measures of this sort would oblige the analyst to behave in an unfriendly way to the patient, and this would have a damaging effect upon the affectionate attitude - upon the positive transference - which is the strongest motive for the patient's taking a share in the joint work of analysis. Thus we should on no account expect very much from this procedure.

This therefore leaves only the one method open to us - the one which was in all probability the only one originally contemplated. We tell the patient about the possibilities of other instinctual conflicts, and we arouse his expectation that such conflicts may occur in him. What we hope is that this information and this warning will have the effect of activating in him one of the conflicts we have indicated, in a modest degree and yet sufficiently for treatment. But this time experience speaks with no uncertain voice. The expected result does not come about. The patient hears our message, but there is no response. He may think to himself: 'This is very interesting, but I feel no trace of it.' We have increased his knowledge, but altered nothing else in him. The situation is much the same as when people read psycho-analytic writings. The reader is 'stimulated' only by those passages which he feels apply to himself - that is, which concern conflicts that are active in him at the time. Everything else leaves him cold. We can have analogous experiences, I think, when we give children sexual enlightenment. I am far from maintaining that this is a harmful or unnecessary thing to do, but it is clear that the prophylactic effect of this liberal measure has been greatly over-estimated. After such enlightenment, children know something they did not know before, but they make no use of the new knowledge that has been presented to them. We come to see that they are not even in so great a hurry to sacrifice for this new knowledge the sexual theories which might be described as a natural growth and which they have constructed in harmony with, and dependence on, their imperfect libidinal organization - theories about the part played by the stork, about the nature of sexual intercourse and about the way in which babies are made. For a long time after they have been given sexual enlightenment they behave like primitive races who have had Christianity thrust upon them and who continue to worship their old idols in secret.

V

We started from the question of how we can shorten the inconveniently long duration of analytic treatment, and, still with this question of time in mind, we went on to consider whether it is possible to achieve a permanent cure or even to prevent future illness by prophylactic treatment. In doing so, we found that the factors which were decisive for the success of our therapeutic efforts were the influence of traumatic aetiology, the relative strength of the instincts which have to be controlled, and something which we have called an alteration of the ego. Only the second of these factors has been discussed by us in any detail, and in connection with it we have had occasion to recognize the paramount importance of the quantitative factor and to stress the claim of the metapsychological line of approach to be taken into account in any attempt at explanation.

Concerning the third factor, the alteration of the ego, we have as yet said nothing. When we turn our attention to it, the first impression we receive is that there is much to ask and much to answer here, and that what we have to say about it will prove to be very inadequate. This first impression is confirmed when we go further into the problem. As is well known, the analytic situation consists in our allying ourselves with the ego of the person under treatment, in order to subdue portions of his id which are uncontrolled - that is to say to include them in the synthesis of his ego. The fact that a co-operation of this kind habitually fails in the case of psychotics affords us a first solid footing for our judgement. The ego, if we are to be able to make such a pact with it, must be a normal one. But a normal ego of this sort is, like normality in general, an ideal fiction. The abnormal ego, which is unserviceable for our purposes, is unfortunately no fiction. Every normal person, in fact, is only normal on the average. His ego approximates to that of the psychotic in some part or other and to a greater or lesser extent; and the degree of its remoteness from one end of the series and of its proximity to the other will furnish us with a provisional measure of what we have so indefinitely termed an 'alteration of the ego'.

If we ask what is the source of the great variety of kinds and degrees of alteration of the ego, we cannot escape the first obvious alternative, that such alterations are either congenital or acquired. Of these, the second sort will be the easier to treat. If they are acquired, it will certainly have been in the course of development, starting from the first years of life. For the ego has to try from the very outset to fulfil its task of mediating between its id and the external world in the service of the pleasure principle, and to protect the id from the dangers of the external world. If, in the course of these efforts, the ego learns to adopt a defensive attitude towards its own id as well and to treat the latter's instinctual demands as external dangers, this happens, at any rate in part, because it understands that a satisfaction of instinct would lead to conflicts with the external world. Thereafter, under the influence of education, the ego grows accustomed to removing the scene of the fight from outside to within and to mastering the *internal* danger before it has become an *external* one; and probably it is most often right in doing so. During this fight on two fronts - later there will be a third front as well - the ego makes use of various procedures for fulfilling its task, which, to put it in general terms, is to avoid danger, anxiety and unpleasure. We call these procedures '*mechanisms of defence*'. Our knowledge of them is not yet sufficiently complete. Anna Freud's book (1936) has given us a first insight into their multiplicity and many-sided significance.

It was from one of those mechanisms, repression, that the study of neurotic processes took its whole start. There was never any doubt that repression was not the only procedure which the ego could employ for its purposes. Nevertheless, repression is something quite peculiar and is more sharply differentiated from the other mechanisms than they are from one another. I should like to make this relation to the other mechanisms clear by an analogy, though I know that in these matters analogies never carry us very far. Let us imagine what might have happened to a book, at a time when books were not printed in editions but were written out individually. We will suppose that a book of this kind contained statements which in later times were regarded as undesirable - as, for instance, according to Robert Eisler (1929), the writings of Flavius Josephus must have contained passages about Jesus Christ which were offensive to later Christendom. At the present day, the only defensive mechanism to which the official censorship could resort would be to confiscate and destroy every copy of the whole edition. At that time, however, various methods were used for making the book innocuous. One way would be for the offending passages to be thickly crossed through so that they were illegible. In that case they could not be transcribed, and the next copyist of the book would produce a text which was unexceptionable but which had gaps in certain passages, and so might be unintelligible in them. Another way, however, if the authorities were not satisfied with this, but wanted also to conceal any indication that the text had been mutilated, would be for them to proceed to distort the text. Single words would be left out or replaced by others, and new sentences interpolated. Best of all, the whole passage would be erased and a new one which said exactly the opposite put in its place. The next transcriber could then produce a text that aroused no suspicion but which was falsified. It no longer contained what the author wanted to say; and it is highly probable that the corrections had not been made in the direction of truth.

If the analogy is not pursued too strictly, we may say that repression has the same relation to the other methods of defence as omission has to distortion of the text, and we may discover in the different forms of this falsification parallels to the variety of ways in which the ego is altered. An attempt may be made to raise the objection that the analogy goes wrong in an essential point, for the distortion of a text is the work of a tendentious censorship, no counterpart to which is to be found in the development of the ego. But this is not so; for a tendentious purpose of this kind is to a great extent represented by the compelling force of the pleasure principle. The psychical apparatus is intolerant of unpleasure; it has to fend it off at all costs, and if the perception of reality entails unpleasure, that perception - that is, the truth - must be sacrificed. Where external dangers are concerned, the individual can help himself for some time by flight and by avoiding the situation of danger, until he is strong enough later on to remove the threat by actively altering reality. But one cannot flee from oneself; flight is no help against internal dangers. And for that reason the defensive mechanisms of the ego are condemned to falsify one's internal perception and to give one only an imperfect and distorted picture of one's id. In its relations to the id, therefore, the ego is paralysed by its restrictions or blinded by its errors; and the result of this in the sphere of psychical events can only be compared to being out walking in a country one does not know and without having a good pair of legs.

The mechanisms of defence serve the purpose of keeping off dangers. It cannot be disputed that they are successful in this; and it is doubtful whether the ego could do without them altogether during its development. But it is also certain that they may become dangers themselves. It sometimes turns out that the ego has paid too high a price for the services they render it. The dynamic expenditure necessary for maintaining them, and the restrictions of the ego which they almost invariably entail, prove a heavy burden on the psychical economy. Moreover, these mechanisms are not relinquished after they have assisted the ego during the difficult years of its development. No one individual, of course, makes use of all the possible mechanisms of defence. Each person uses no more than a selection of them. But these become fixated in his ego. They become regular modes of reaction of his character, which are repeated throughout his life whenever a situation occurs that is similar to the original one. This turns them into infantilisms, and they share the fate of so many institutions which attempt to keep themselves in existence after the time of their usefulness has passed. 'Vernunft wird Unsinn, Wohltat Plage'¹ as the poet complains. The adult's ego, with its increased strength, continues to defend itself against dangers which no longer exist in reality; indeed, it finds itself compelled to seek out those situations in reality which can serve as an approximate substitute for the original danger, so as to be able to justify, in relation to them, its maintaining its habitual modes of reaction. Thus we can easily understand how the defensive mechanisms, by bringing about an ever more extensive alienation from the external world and a permanent weakening of the ego, pave the way for, and encourage, the outbreak of neurosis.

¹ [Reason becomes unreason, kindness torment.]

At the moment, however, we are not concerned with the pathogenic role of the defensive mechanisms. What we are trying to discover is what influence the alteration of the ego which corresponds to them has upon our therapeutic efforts. The material for an answer to this question is given in the volume by Anna Freud to which I have already referred. The essential point is that the patient repeats these modes of reaction during the work of analysis as well, that he produces them before our eyes, as it were. In fact, it is only in this way that we get to know them. This does not mean that they make analysis impossible. On the contrary, they constitute half of our analytic task. The other half, the one which was first tackled by analysis in its early days, is the uncovering of what is hidden in the id. During the treatment our therapeutic work is constantly swinging backwards and forwards like a pendulum between a piece of id-analysis and a piece of ego-analysis. In the one case we want to make something from the id conscious, in the other we want to correct something in the ego. The crux of the matter is that the defensive mechanisms directed against former danger recur in the treatment as *resistances* against recovery. It follows from this that the ego treats recovery itself as a new danger.

The therapeutic effect depends on making conscious what is repressed, in the widest sense of the word, in the id. We prepare the way for this making conscious by interpretations and constructions, but we have interpreted only for ourselves not for the patient so long as the ego holds on to its earlier defences and does not give up its resistances. Now these resistances, although they belong to the ego, are nevertheless unconscious and in some sense separated off within the ego. The analyst recognizes them more easily than he does the hidden material in the id. One might suppose that it would be sufficient to treat them like portions of the id and, by making them conscious, bring them into connection with the rest of the ego. In this way, we should suppose, one half of the task of analysis would be accomplished; we should not reckon on meeting with a resistance against the uncovering of resistances. But what happens is this. During the work on the resistances the ego withdraws - with a greater or less degree of seriousness - from the agreement on which the analytic situation is founded. The ego ceases to support our efforts at uncovering the id; it opposes them, disobeys the fundamental rule of analysis, and allows no further derivatives of the repressed to emerge. We cannot expect the patient to have a strong conviction of the curative power of analysis. He may have brought along with him a certain amount of confidence in his analyst, which will be strengthened to an effective point by the factors of the positive transference which will be aroused in him. Under the influence of the unpleasurable impulses which he feels as a result of the fresh activation of his defensive conflicts, negative transferences may now gain the upper hand and completely annul the analytic situation. The patient now regards the analyst as no more than a stranger who is making disagreeable demands on him, and he behaves towards him exactly like a child who does not like the stranger and does not believe anything he says. If the analyst tries to explain to the patient one of the distortions made by him for the purposes of defence, and to correct it, he finds him uncomprehending and inaccessible to sound arguments. Thus we see that there is a resistance against the uncovering of resistances, and the defensive mechanisms really do deserve the name which we gave them originally, before they had been more closely examined. They are resistances not only to the making conscious of contents of the id, but also to the analysis as a whole, and thus to recovery.

The effect brought about in the ego by the defences can rightly be described as an 'alteration of the ego' if by that we understand a deviation from the fiction of a normal ego which would guarantee unshakable loyalty to the work of analysis. It is easy, then, to accept the fact, shown by daily experience, that the outcome of an analytic treatment depends essentially on the strength and on the depth of root of these resistances that bring about an alteration of the ego. Once again we are confronted with the importance of the quantitative factor, and once again we are reminded that analysis can only draw upon definite and limited amounts of energy which have to be measured against the hostile forces. And it seems as if victory is in fact as a rule on the side of the big battalions.

VI

The next question we come to is whether every alteration of the ego - in our sense of the term - is acquired during the defensive struggles of the earliest years. There can be no doubt about the answer. We have no reason to dispute the existence and importance of original, innate distinguishing characteristics of the ego. This is made certain by the single fact that each person makes a selection from the possible mechanisms of defence, that he always uses a few only of them and always the same ones. This would seem to indicate that each ego is endowed from the first with individual dispositions and trends, though it is true that we cannot specify their nature or what determines them. Moreover, we know that we must not exaggerate the difference between inherited and acquired characters into an antithesis; what was acquired by our forefathers certainly forms an important part of what we inherit. When we speak of an 'archaic heritage' we are usually thinking only of the id and we seem to assume that at the beginning of the individual's life no ego is as yet in existence. But we shall not overlook the fact that id and ego are originally one; nor does it imply any mystical overvaluation of heredity if we think it credible that, even before the ego has come into existence, the lines of development, trends and reactions which it will later exhibit are already laid down for it. The psychological peculiarities of families, races and nations, even in their attitude to analysis, allow of no other explanation. Indeed, more than this: analytic experience has forced on us a conviction that even particular psychical contents, such as symbolism, have no other sources than hereditary transmission, and researches in various fields of social anthropology, make it plausible to suppose that other, equally specialized precipitates left by early human development are also present in the archaic heritage.

With the recognition that the properties of the ego which we meet with in the form of resistances can equally well be determined by heredity as acquired in defensive struggles, the topographical distinction between what is ego and what is id loses much of its value for our investigation. If we advance a step further in our analytic experience, we come upon resistances of another kind, which we can no longer localize and which seem to depend on fundamental conditions in the mental apparatus. I can only give a few examples of this type of resistance; the whole field of enquiry is still bewilderingly strange and insufficiently explored. We come across people, for instance, to whom we should be inclined to attribute a special 'adhesiveness of the libido'. The processes which the treatment sets in motion in them are so much slower than in other people because, apparently, they cannot make up their minds to detach libidinal cathexes from one object and displace them on to another, although we can discover no special reason for this cathectic loyalty. One meets with the opposite type of person, too, in whom the libido seems particularly mobile; it enters readily upon the new cathexes suggested by analysis, abandoning its former ones in exchange for them. The difference between the two types is comparable to the one felt by a sculptor, according to whether he works in hard stone or soft clay. Unfortunately, in this second type the results of analysis often turn out to be very impermanent: the new cathexes are soon given up once more, and we have an impression, not of having worked in clay, but of having written on water. In the words of the proverb: 'Soon got, soon gone.'¹

¹ ['*Wie gewonnen, so zerronnen.*']

In another group of cases we are surprised by an attitude in our patients which can only be put down to a depletion of the plasticity, the capacity for change and further development, which we should ordinarily expect. We are, it is true, prepared to find in analysis a certain amount of psychical inertia. When the work of analysis has opened up new paths for an instinctual impulse, we almost invariably observe that the impulse does not enter upon them without marked hesitation. We have called this behaviour, perhaps not quite correctly, 'resistance from the id'. But with the patients I here have in mind, all the mental processes, relationships and distributions of force are unchangeable, fixed and rigid. One finds the same thing in very old people, in which case it is explained as being due to what is described as force of habit or an exhaustion of receptivity - a kind of psychical entropy. But we are dealing here with people who are still young. Our theoretical knowledge does not seem adequate to give a correct explanation of such types. Probably some temporal characteristics are concerned - some alterations of a rhythm of development in psychical life which we have not yet appreciated.

In yet another group of cases the distinguishing characteristics of the ego, which are to be held responsible as sources of resistance against analytic treatment and as impediments to therapeutic success, may spring from different and deeper roots. Here we are dealing with the ultimate things which psychological research can learn about: the behaviour of the two primal instincts, their distribution, mingling and defusion - things which we cannot think of as being confined to a single province of the mental apparatus, the id, the ego or the super-ego. No stronger impression arises from the resistances during the work of analysis than of there being a force which is defending itself by every possible means against recovery and which is absolutely resolved to hold on to illness and suffering. One portion of this force has been recognized by us, undoubtedly with justice, as the sense of guilt and need for punishment, and has been localized by us in the ego's relation to the super-ego. But this is only the portion of it which is, as it were, psychically bound by the super-ego and thus becomes recognizable; other quotas of the same force, whether bound or free, may be at work in other, unspecified places. If we take into consideration the total picture made up of the phenomena of masochism immanent in so many people, the negative therapeutic reaction and the sense of guilt found in so many neurotics, we shall no longer be able to adhere to the belief that mental events are exclusively governed by the desire for pleasure. These phenomena are unmistakable indications of the presence of a power in mental life which we call the instinct of aggression or of destruction according to its aims, and which we trace back to the original death instinct of living matter. It is not a question of an antithesis between an optimistic and a pessimistic theory of life. Only by the concurrent or mutually opposing action of the two primal instincts - Eros and the death instinct -, never by one or the other alone, can we explain the rich multiplicity of the phenomena of life.

How parts of these two classes of instincts combine to fulfil the various vital functions, under what conditions such combinations grow looser or break up, to what disturbances these changes correspond and with what feelings the perceptual scale of the pleasure principle replies to them - these are problems whose elucidation would be the most rewarding achievement of psychological research. For the moment we must bow to the superiority of the forces against which we see our efforts come to nothing. Even to exert a psychical influence on simple masochism is a severe tax upon our powers.

In studying the phenomena which testify to the activity of the destructive instinct, we are not confined to observations on pathological material. Numerous facts of normal mental life call for an explanation of this kind, and the sharper our eye grows, the more copiously they strike us. The subject is too new and too important for me to treat it as a side-issue in this discussion. I shall therefore content myself with selecting a few sample cases.

Here is one instance. It is well known that at all periods there have been, as there still are, people who can take as their sexual objects members of their own sex as well as of the opposite one, without the one trend interfering with the other. We call such people bisexuals, and we accept their existence without feeling much surprise about it. We have come to learn, however, that every human being is bisexual in this sense and that his libido is distributed, either in a manifest or a latent fashion, over objects of both sexes. But we are struck by the following point. Whereas in the first class of people the two trends have got on together without clashing, in the second and more numerous class they are in a state of irreconcilable conflict. A man's heterosexuality will not put up with any homosexuality, and *vice versa*. If the former is the stronger it succeeds in keeping the latter latent and forcing it away from satisfaction in reality. On the other hand, there is no greater danger for a man's heterosexual function than its being disturbed by his latent homosexuality. We might attempt to explain this by saying that each individual only has a certain quota of libido at his disposal, for which the two rival trends have to struggle. But it is not clear why the rivals do not always divide up the available quota of libido between them according to their relative strength, since they are able to do so in a number of cases. We are forced to the conclusion that the tendency to a conflict is something special, something which is newly added to the situation, irrespective of the quantity of libido. An independently-emerging tendency to conflict of this sort can scarcely be attributed to anything but the intervention of an element of free aggressiveness.

If we recognize the case we are discussing as an expression of the destructive or aggressive instinct, the question at once arises whether this view should not be extended to other instances of conflict, and, indeed, whether all that we know about psychical conflict should not be revised from this new angle. After all, we assume that in the course of man's development from a primitive state to a civilized one his aggressiveness undergoes a very considerable degree of internalization or turning inwards; if so, his internal conflicts would certainly be the proper equivalent for the external struggles which have then ceased. I am well aware that the dualistic theory according to which an instinct of death or of destruction or aggression claims equal rights as a partner with Eros as manifested in the libido, has found little sympathy and has not really been accepted even among psycho-analysts. This made me all the more pleased when not long ago I came upon this theory of mine in the writings of one of the great thinkers of ancient Greece. I am very ready to give up the prestige of originality for the sake of such a confirmation, especially as I can never be certain, in view of the wide extent of my reading in early years, whether what I took for a new creation might not be an effect of cryptomnesia.

Empedocles of Acragas (Girgenti),¹ born about 495 B.C., is one of the grandest and most remarkable figures in the history of Greek civilization. The activities of his many-sided personality pursued the most varied directions. He was an investigator and a thinker, a prophet and a magician, a politician, a philanthropist and a physician with a knowledge of natural science. He was said to have freed the town of Selinunte from malaria, and his contemporaries revered him as a god. His mind seems to have united the sharpest contrasts. He was exact and sober in his physical and physiological researches, yet he did not shrink from the obscurities of mysticism, and built up cosmic speculations of astonishingly imaginative boldness. Capelle compares him with Dr. Faust 'to whom many a secret was revealed'. Born as he was at a time when the realm of science was not yet divided into so many provinces, some of his theories must inevitably strike us as primitive. He explained the variety of things by the mixture of the four elements, earth, air, fire and water. He held that all nature was animate, and he believed in the transmigration of souls. But he also included in his theoretical body of knowledge such modern ideas as the gradual evolution of living creatures, the survival of the fittest and a recognition of the part played by chance (τύχη) in that evolution.

But the theory of Empedocles which especially deserves our interest is one which approximates so closely to the psycho-analytic theory of the instincts that we should be tempted to maintain that the two are identical, if it were not for the difference that the Greek philosopher's theory is a cosmic phantasy while ours is content to claim biological validity. At the same time, the fact that Empedocles ascribes to the universe the same animate nature as to individual organisms robs this difference of much of its importance.

¹ I have based what follows on a work by Wilhelm Capelle (1935).

The philosopher taught that two principles governed events in the life of the universe and in the life of the mind, and that those principles were everlastingly at war with each other. He called them *φιλία* (love) and *νεῖκος* (strife). Of these two powers - which he conceived of as being at bottom 'natural forces operating like instincts, and by no means intelligences with a conscious purpose'¹ - the one strives to agglomerate the primal particles of the four elements into a single unity, while the other, on the contrary, seeks to undo all those fusions and to separate the primal particles of the elements from one another. Empedocles thought of the process of the universe as a continuous, never-ceasing alternation of periods, in which the one or the other of the two fundamental forces gain the upper hand, so that at one time love and at another strife puts its purpose completely into effect and dominates the universe, after which the other, vanquished, side asserts itself and in its turn defeats its partner.

The two fundamental principles of Empedocles - *φιλία* and *νεῖκος* - are, both in name and function, the same as our two primal instincts, *Eros* and *destructiveness*, the first of which endeavours to combine what exists into ever greater unities, while the second endeavours to dissolve those combinations and to destroy the structures to which they have given rise. We shall not be surprised, however, to find that, on its re-emergence after two and a half millennia, this theory has been altered in some of its features. Apart from the restriction to the biophysical field which is imposed on us, we no longer have as our basic substances the four elements of Empedocles; what is living has been sharply differentiated from what is inanimate, and we no longer think of the mingling and separation of particles of substance, but of the soldering together and defusion of instinctual components. Moreover, we have provided some sort of biological basis for the principle of 'strife' by tracing back our instinct of destruction to the death instinct, to the urge of what is living to return to an inanimate state. This is not to deny that an analogous instinct already existed earlier, nor, of course, to assert that an instinct of this sort only came into existence with the emergence of life. And no one can foresee in what guise the nucleus of truth contained in the theory of Empedocles will present itself to later understanding.

¹ Capelle (1935), 186.

VII

In 1927, Ferenczi read an instructive paper on the problem of the termination of analyses. It ends with a comforting assurance that 'analysis is not an endless process, but one which can be brought to a natural end with sufficient skill and patience on the analyst's part'. The paper as a whole, however, seems to me to be in the nature of a warning not to aim at shortening analysis but at deepening it. Ferenczi makes the further important point that success depends very largely on the analyst's having learnt sufficiently from his own 'errors and mistakes' and having got the better of 'the weak points in his own personality'. This provides an important supplement to our theme. Among the factors which influence the prospects of analytic treatment and add to its difficulties in the same manner as the resistances, must be reckoned not only the nature of the patient's ego but the individuality of the analyst.

It cannot be disputed that analysts in their own personalities have not invariably come up to the standard of psychical normality to which they wish to educate their patients. Opponents of analysis often point to this fact with scorn and use it as an argument to show the uselessness of analytic exertions. We might reject this criticism as making unjustifiable demands. Analysts are people who have learned to practise a particular art; alongside of this, they may be allowed to be human beings like anyone else. After all, nobody maintains that a physician is incapable of treating internal diseases if his own internal organs are not sound; on the contrary, it may be argued that there are certain advantages in a man who is himself threatened with tuberculosis specializing in the treatment of persons suffering from that disease. But the cases are not on all fours. So long as he is capable of practising at all, a doctor suffering from disease of the lungs or heart is not handicapped either in diagnosing or treating internal complaints; whereas the special conditions of analytic work do actually cause the analyst's own defects to interfere with his making a correct assessment of the state of things in his patient and reacting to them in a useful way. It is therefore reasonable to expect of an analyst, as a part of his qualifications, a considerable degree of mental normality and correctness. In addition, he must possess some kind of superiority, so that in certain analytic situations he can act as a model for his patient and in others as a teacher. And finally we must not forget that the analytic relationship is based on a love of truth - that is, on a recognition of reality - and that it precludes any kind of sham or deceit.

Here let us pause for a moment to assure the analyst that he has our sincere sympathy in the very exacting demands he has to fulfil in carrying out his activities. It almost looks as if analysis were the third of those 'impossible' professions in which one can be sure beforehand of achieving unsatisfying results. The other two, which have been known much longer, are education and government. Obviously we cannot demand that the prospective analyst should be a perfect being before he takes up analysis, in other words that only persons of such high and rare perfection should enter the profession. But where and how is the poor wretch to acquire the ideal qualifications which he will need in his profession? The answer is, in an analysis of himself, with which his preparation for his future activity begins. For practical reasons this analysis can only be short and incomplete. Its main object is to enable his teacher to make a judgement as to whether the candidate can be accepted for further training. It has accomplished its purpose if it gives the learner a firm conviction of the existence of the unconscious, if it enables him, when repressed material emerges, to perceive in himself things which would otherwise be incredible to him, and if it shows him a first sample of the technique which has proved to be the only effective one in analytic work. This alone would not suffice for his instruction; but we reckon on the stimuli that he has received in his own analysis not ceasing when it ends and on the processes of remodelling the ego continuing spontaneously in the analysed subject and making use of all subsequent experiences in this newly-acquired sense. This does in fact happen, and in so far as it happens it makes the analysed subject qualified to be an analyst himself.

Unfortunately something else happens as well. In trying to describe this, one can only rely on impressions. Hostility on the one side and partisanship on the other create an atmosphere which is not favourable to objective investigation. It seems that a number of analysts learn to make use of defensive mechanisms which allow them to divert the implications and demands of analysis from themselves (probably by directing them on to other people), so that they themselves remain as they are and are able to withdraw from the critical and corrective influence of analysis. Such an event may justify the words of the writer who warns us that when a man is endowed with power it is hard for him not to misuse it.¹ Sometimes, when we try to understand this, we are driven into drawing a disagreeable analogy with the effect of X-rays on people who handle them without taking special precautions. It would not be surprising if the effect of a constant preoccupation with all the repressed material which struggles for freedom in the human mind were to stir up in the analyst as well all the instinctual demands which he is otherwise able to keep under suppression. These, too, are 'dangers of analysis', though they threaten, not the passive but the active partner in the analytic situation; and we ought not to neglect to meet them. There can be no doubt how this is to be done. Every analyst should periodically - at intervals of five years or so - submit himself to analysis once more, without feeling ashamed of taking this step. This would mean, then, that not only the therapeutic analysis of patients but his own analysis would change from a terminable into an interminable task.

At this point, however, we must guard against a misconception. I am not intending to assert that analysis is altogether an endless business. Whatever one's theoretical attitude to the question may be, the termination of an analysis is, I think a practical matter. Every experienced analyst will be able to recall a number of cases in which he has bidden his patient a permanent farewell *rebus bene gestis*². In cases of what is known as character-analysis there is a far smaller discrepancy between theory and practice. Here it is not easy to foresee a natural end, even if one avoids any exaggerated expectations and sets the analysis no excessive tasks. Our aim will not be to rub off every peculiarity of human character for the sake of a schematic 'normality', nor yet to demand that the person who has been 'thoroughly analysed' shall feel no passions and develop no internal conflicts. The business of the analysis is to secure the best possible psychological conditions for the functions of the ego; with that it has discharged its task.

¹ Anatole France, *La révolte des anges*.

² ['Things having gone well.']

VIII

Both in therapeutic and in character-analyses we notice that two themes come into especial prominence and give the analyst an unusual amount of trouble. It soon becomes evident that a general principle is at work here. The two themes are tied to the distinction between the sexes; one is as characteristic of males as the other is of females. In spite of the dissimilarity of their content, there is an obvious correspondence between them. Something which both sexes have in common has been forced, by the difference between the sexes, into different forms of expression.

The two corresponding themes are in the female, *an envy for the penis* - a positive striving to possess a male genital - and, in the male, a struggle against his passive or feminine attitude to another male. What is common to the two themes was singled out at an early date by psycho-analytic nomenclature as an attitude towards the castration complex. Subsequently Alfred Adler brought the term 'masculine protest' into current use. It fits the case of males perfectly; but I think that, from the start, 'repudiation of femininity' would have been the correct description of this remarkable feature in the psychical life of human beings.

In trying to introduce this factor into the structure of our theory, we must not overlook the fact that it cannot, by its very nature, occupy the same position in both sexes. In males the striving to be masculine is completely ego-syntonic from the first; the passive attitude, since it presupposes an acceptance of castration, is energetically repressed, and often its presence is only indicated by excessive overcompensations. In females, too, the striving to be masculine is ego-syntonic at a certain period - namely in the phallic phase, before the development to femininity has set in. But it then succumbs to the momentous process of repression whose outcome, as has so often been shown, determines the fortunes of a woman's femininity. A great deal depends on whether a sufficient amount of her masculinity complex escapes repression and exercises a permanent influence on her character. Normally, large portions of the complex are transformed and contribute to the construction of her femininity: the appeased wish for a penis is destined to be converted into a wish for a baby and for a husband, who possesses a penis. It is strange, however, how often we find that the wish for masculinity has been retained in the unconscious and, from out of its state of repression, exercises a disturbing influence.

As will be seen from what I have said, in both cases it is the attitude proper to the opposite sex which has succumbed to repression. I have already stated elsewhere¹ that it was Wilhelm Fliess who called my attention to this point. Fliess was inclined to regard the antithesis between the sexes as the true cause and primal motive force of repression. I am only repeating what I said then in disagreeing with his view, when I decline to sexualize repression in this way - that is, to explain it on biological grounds instead of on purely psychological ones.

¹ "A Child is being Beaten" (1919e).

The paramount importance of these two themes - in females the wish for a penis and in males the struggle against passivity - did not escape Ferenczi's notice. In the paper read by him in 1927 he made it a requirement that in every successful analysis those two complexes must have been mastered.¹ I should like to add that, speaking from my own experience, I think that in this Ferenczi was asking a very great deal. At no other point in one's analytic work does one suffer more from an oppressive feeling that all one's repeated efforts have been in vain, and from a suspicion that one has been 'preaching to the winds', than when one is trying to persuade a woman to abandon her wish for a penis on the ground of its being unrealizable or when one is seeking to convince a man that a passive attitude to men does not always signify castration and that it is indispensable in many relationships in life. The rebellious overcompensation of the male produces one of the strongest transference-resistances. He refuses to subject himself to a father-substitute, or to feel indebted to him for anything, and consequently he refuses to accept his recovery from the doctor. No analogous transference can arise from the female's wish for a penis, but it is the source of outbreaks of severe depression in her, owing to an internal conviction that the analysis will be of no use and that nothing can be done to help her. And we can only agree that she is right, when we learn that her strongest motive in coming for treatment was the hope that, after all, she might still obtain a male organ, the lack of which was so painful to her.

¹ ' . . . Every male patient must attain a feeling of equality in relation to the physician as a sign that he has overcome his fear of castration; every female patient, if her neurosis is to be regarded as fully disposed of, must have got rid of her masculinity complex and must emotionally accept without a trace of resentment the implications of her female role.' (Ferenczi, 1928, 8.)

But we also learn from this that it is not important in what form the resistance appears, whether as a transference or not. The decisive thing remains that the resistance prevents any change from taking place - that everything stays as it was. We often have the impression that with the wish for a penis and the masculine protest we have penetrated through all the psychological strata and have reached bedrock, and that thus our activities are at an end. This is probably true, since, for the psychical field, the biological field does in fact play the part of the underlying bedrock. The repudiation of femininity can be nothing else than a biological fact, a part of the great riddle of sex.¹ It would be hard to say whether and when we have succeeded in mastering this factor in an analytic treatment. We can only console ourselves with the certainty that we have given the person analysed every possible encouragement to re-examine and alter his attitude to it.

¹ We must not be misled by the term 'masculine protest' into supposing that what the man is repudiating is his passive attitude - what might be called the social aspect of femininity. Such a view is contradicted by an observation that is easily verifiable - namely that such men often display a masochistic attitude - a state that amounts to bondage - towards women. What they reject is not passivity in general, but passivity towards a male. In other words, the 'masculine protest' is in fact nothing else than castration anxiety.

CONSTRUCTIONS IN ANALYSIS

I

It has always seemed to me to be greatly to the credit of a certain well-known man of science that he treated psycho-analysis fairly at a time when most other people felt themselves under no such obligation. On one occasion, nevertheless, he gave expression to an opinion upon analytic technique which was at once derogatory and unjust. He said that in giving interpretations to a patient we treat him upon the famous principle of 'Heads I win, tails you lose'.¹ That is to say, if the patient agrees with us, then the interpretation is right; but if he contradicts us, that is only a sign of his resistance, which again shows that we are right. In this way we are always in the right against the poor helpless wretch whom we are analysing, no matter how he may respond to what we put forward. Now, since it is in fact true that a 'No' from one of our patients is not as a rule enough to make us abandon an interpretation as incorrect, a revelation such as this of the nature of our technique has been most welcome to the opponents of analysis. It is therefore worth while to give a detailed account of how we are accustomed to arrive at an assessment of the 'Yes' or 'No' of our patients during analytic treatment - of their expression of agreement or of denial. The practising analyst will naturally learn nothing in the course of this apologia that he does not know already.

¹ [In English in the original.]

It is familiar ground that the work of analysis aims at inducing the patient to give up the repressions (using the word in the widest sense) belonging to his early development and to replace them by reactions of a sort that would correspond to a psychically mature condition. With this purpose in view he must be brought to recollect certain experiences and the affective impulses called up by them which he has for the time being forgotten. We know that his present symptoms and inhibitions are the consequences of repressions of this kind: thus that they are a substitute for these things that he has forgotten. What sort of material does he put at our disposal which we can make use of to put him on the way to recovering the lost memories? All kinds of things. He gives us fragments of these memories in his dreams, invaluable in themselves but seriously distorted as a rule by all the factors concerned in the formation of dreams. Again, he produces ideas, if he gives himself up to 'free association', in which we can discover allusions to the repressed experiences and derivatives of the suppressed affective impulses as well as of the reactions against them. And, finally, there are hints of repetitions of the affects belonging to the repressed material to be found in actions performed by the patient, some fairly important, some trivial, both inside and outside the analytic situation. Our experience has shown that the relation of transference, which becomes established towards the analyst, is particularly calculated to favour the return of these emotional connections. It is out of such raw material - if we may so describe it - that we have to put together what we are in search of.

What we are in search of is a picture of the patient's forgotten years that shall be alike trustworthy and in all essential respects complete. But at this point we are reminded that the work of analysis consists of two quite different portions, that it is carried on in two separate localities, that it involves two people, to each of whom a distinct task is assigned. It may for a moment seem strange that such a fundamental fact should not have been pointed out long ago; but it will immediately be perceived that there was nothing being kept back in this, that it is a fact which is universally known and, as it were, self-evident and is merely being brought into relief here and separately examined for a particular purpose. We all know that the person who is being analysed has to be induced to remember something that has been experienced by him and repressed; and the dynamic determinants of this process are so interesting that the other portion of the work, the task performed by the analyst, has been pushed into the background. The analyst has neither experienced nor repressed any of the material under consideration; his task cannot be to remember anything. What then *is* his task? His task is to make out what has been forgotten from the traces which it has left behind or, more correctly, to *construct* it. The time and manner in which he conveys his constructions to the person who is being analysed, as well as the explanations with which he accompanies them, constitute the link between the two portions of the work of analysis, between his own part and that of the patient.

His work of construction, or, if it is preferred, of reconstruction, resembles to a great extent an archaeologist's excavation of some dwelling-place that has been destroyed and buried or of some ancient edifice. The two processes are in fact identical, except that the analyst works under better conditions and has more material at his command to assist him, since what he is dealing with is not something destroyed but something that is still alive - and perhaps for another reason as well. But just as the archaeologist builds up the walls of the building from the foundations that have remained standing, determines the number and position of the columns from depressions in the floor and reconstructs the mural decorations and paintings from the remains found in the debris, so does the analyst proceed when he draws his inferences from the fragments of memories, from the associations and from the behaviour of the subject of the analysis. Both of them have an undisputed right to reconstruct by means of supplementing and combining the surviving remains. Both of them, moreover, are subject to many of the same difficulties and sources of error. One of the most ticklish problems that confronts the archaeologist is notoriously the determination of the relative age of his finds; and if an object makes its appearance in some particular level, it often remains to be decided whether it belongs to that level or whether it was carried down to that level owing to some subsequent disturbance. It is easy to imagine the corresponding doubts that arise in the case of analytic constructions.

The analyst, as we have said, works under more favourable conditions than the archaeologist since he has at his disposal material which can have no counterpart in excavations, such as the repetitions of reactions dating from infancy and all that is indicated by the transference in connection with these repetitions. But in addition to this it must be borne in mind that the excavator is dealing with destroyed objects of which large and important portions have quite certainly been lost, by mechanical violence, by fire and by plundering. No amount of effort can result in their discovery and lead to their being united with the surviving remains. The one and only course open is that of reconstruction, which for this reason can often reach only a certain degree of probability. But it is different with the psychical object whose early history the analyst is seeking to recover. Here we are regularly met by a situation which with the archaeological object occurs only in such rare circumstances as those of Pompeii or of the tomb of Tut'ankhamun. All of the essentials are preserved; even things that seem completely forgotten are present somehow and somewhere, and have merely been buried and made inaccessible to the subject. Indeed, it may, as we know, be doubted whether any psychical structure can really be the victim of total destruction. It depends only upon analytic technique whether we shall succeed in bringing what is concealed completely to light. There are only two other facts that weigh against the extraordinary advantage which is thus enjoyed by the work of analysis: namely, that psychical objects are incomparably more complicated than the excavator's material ones and that we have insufficient knowledge of what we may expect to find, since their finer structure contains so much that is still mysterious. But our comparison between the two forms of work can go no further than this; for the main difference between them lies in the fact that for the archaeologist the reconstruction is the aim and end of his endeavours while for analysis the construction is only a preliminary labour.

II

It is not, however, a preliminary labour in the sense that the whole of it must be completed before the next piece of work can be begun, as, for instance, is the case with house-building, where all the walls must be erected and all the windows inserted before the internal decoration of the rooms can be taken in hand. Every analyst knows that things happen differently in an analytic treatment and that there both kinds of work are carried on side by side, the one kind being always a little ahead and the other following upon it. The analyst finishes a piece of construction and communicates it to the subject of the analysis so that it may work upon him; he then constructs a further piece out of the fresh material pouring in upon him, deals with it in the same way and proceeds in this alternating fashion until the end. If, in accounts of analytic technique, so little is said about 'constructions', that is because 'interpretations' and their effects are spoken of instead. But I think that 'construction' is by far the more appropriate description. 'Interpretation' applies to something that one does to some single element of the material, such as an association or a parapraxis. But it is a 'construction' when one lays before the subject of the analysis a piece of his early history that he has forgotten, in some such way as this: 'Up to your n th year you regarded yourself as the sole and unlimited possessor of your mother; then came another baby and brought you grave disillusionment. Your mother left you for some time, and even after her reappearance she was never again devoted to you exclusively. Your feelings towards your mother became ambivalent, your father gained a new importance for you,' . . . and so on.

In the present paper our attention will be turned exclusively to this preliminary labour performed by constructions. And here, at the very start, the question arises of what guarantee we have while we are working on these constructions that we are not making mistakes and risking the success of the treatment by putting forward some construction that is incorrect. It may seem that no general reply can in my event be given to this question; but even before discussing it we may lend our ear to some comforting information that is afforded by analytic experience. For we learn from it that no damage is done if, for once in a way, we make a mistake and offer the patient a wrong construction as the probable historical truth. A waste of time is, of course, involved, and anyone who does nothing but present the patient with false combinations will neither create a very good impression on him nor carry the treatment very far; but a single mistake of the sort can do no harm. What in fact occurs in such an event is rather that the patient remains as though he were untouched by what has been said and reacts to it with neither a 'Yes' nor a 'No'. This may possibly mean no more than that his reaction is postponed; but if nothing further develops we may conclude that we have made a mistake and we shall admit as much to the patient at some suitable opportunity without sacrificing any of our authority. Such an opportunity will arise when some new material has come to light which allows us to make a better construction and so to correct our error. In this way the false construction drops out, as if it had never been made; and, indeed, we often get an impression as though, to borrow the words of Polonius, our bait of falsehood had taken a carp of truth. The danger of our leading a patient astray by suggestion, by persuading him to accept things which we ourselves believe but which he ought not to, has certainly been enormously exaggerated. An analyst would have had to behave very incorrectly before such a misfortune could overtake him; above all, he would have to blame himself with not allowing his patients to have their say. I can assert without boasting that such an abuse of 'suggestion' has never occurred in my practice.

It already follows from what has been said that we are not at all inclined to neglect the indications that can be inferred from the patient's reaction when we have offered him one of our constructions. The point must be gone into in detail. It is true that we do not accept the 'No' of a person under analysis at its face value; but neither do we allow his 'Yes' to pass. There is no justification for accusing us of invariably twisting his remarks into a confirmation. In reality things are not so simple and we do not make it so easy for ourselves to come to a conclusion.

A plain 'Yes' from a patient is by no means unambiguous. It can indeed signify that he recognizes the correctness of the construction that has been presented to him; but it can also be meaningless, or can even deserve to be described as 'hypocritical', since it may be convenient for his resistance to make use of an assent in such circumstances in order to prolong the concealment of a truth that has not been discovered. The 'Yes' has no value unless it is followed by indirect confirmations, unless the patient, immediately after his 'Yes', produces new memories which complete and extend the construction. Only in such an event do we consider that the 'Yes' has dealt completely with the subject under discussion.

A 'No' from a person in analysis is quite as ambiguous as a 'Yes', and is indeed of even less value. In some rare cases it turns out to be the expression of a legitimate dissent. Far more frequently it expresses a resistance which may have been evoked by the subject-matter of the construction that has been put forward but which may just as easily have arisen from some other factor in the complex analytic situation. Thus, a patient's 'No' is no evidence of the correctness of a construction, though it is perfectly compatible with it. Since every such construction is an incomplete one, since it covers only a small fragment of the forgotten events, we are free to suppose that the patient is not in fact disputing what has been said to him but is basing his contradiction upon the part that has not yet been uncovered. As a rule he will not give his assent until he has learnt the whole truth - which often covers a very great deal of ground. So that the only safe interpretation of his 'No' is that it points to incompleteness; there can be no doubt that the construction has not told him everything.

It appears, therefore, that the direct utterances of the patient after he has been offered a construction afford very little evidence upon the question whether we have been right or wrong. It is of all the greater interest that there are indirect forms of confirmation which are in every respect trustworthy. One of these is a form of words that is used (as though by general agreement) with very little variation by the most different people: 'I didn't ever think' (or 'I shouldn't ever have thought') 'that' (or 'of that'). This can be translated without any hesitation into: 'Yes, you're right this time - about my *unconscious*.' Unfortunately this formula, which is so welcome to the analyst, reaches his ears more often after single interpretations than after he has produced an extensive construction. An equally valuable confirmation is implied (expressed this time positively) when the patient answers with an association which contains something similar or analogous to the content of the construction. Instead of taking an example of this from an analysis (which would be easy to find but lengthy to describe) I prefer to give an account of a small extra-analytical experience which presents a similar situation so strikingly that it produces an almost comic effect. It concerned one of my colleagues who - it was long ago - had chosen me as a consultant in his medical practice. One day, however, he brought his young wife to see me, as she was causing him trouble. She refused on all sorts of pretexts to have sexual relations with him, and what he expected of me was evidently that I should lay before her the consequences of her ill-advised behaviour. I went into the matter and explained to her that her refusal would probably have unfortunate results for her husband's health or would lay him open to temptations that might lead to a break-up of their marriage. At this point he suddenly interrupted me with the remark: 'The Englishman you diagnosed as suffering from a cerebral tumour has died too.' At first the remark seemed incomprehensible; the 'too' in his sentence was a mystery, for we had not been speaking of anyone else who had died. But a short time afterwards I understood. The man was evidently intending to confirm what I had been saying; he was meaning to say: 'Yes, you're certainly quite right. Your diagnosis was confirmed in the case of the other patient too.' It was an exact parallel to the indirect confirmations that we obtain in analysis from associations. I will not attempt to deny that there were other thoughts as well, put on one side by my colleague, which had a share in determining his remark.

Indirect confirmation from associations that fit in with the content of a construction - that give us a 'too' like the one in my story - provides a valuable basis for judging whether the construction is likely to be confirmed in the course of the analysis. It is particularly striking when, by means of a parapraxis, a confirmation of this kind insinuates itself into a direct denial. I once published elsewhere a nice example of this. The name 'Jauner' (a familiar one in Vienna) came up repeatedly in one of my patient's dreams without a sufficient explanation appearing in his associations. I finally put forward the interpretation that when he said 'Jauner' he probably meant 'Gauner', whereupon he promptly replied: 'That seems to me too "*jewagt*".' Or there was the other instance, in which, when I suggested to a patient that he considered a particular fee too high, he meant to deny the suggestion with the words 'Ten dollars mean nothing to me' but instead of dollars put in a coin of lower value and said 'ten shillings'.

If an analysis is dominated by powerful factors that impose a negative therapeutic reaction, such as a sense of guilt, a masochistic need for suffering or repugnance to receiving help from the analyst, the patient's behaviour after he has been offered a construction often makes it very easy for us to arrive at the decision that we are in search of. If the construction is wrong, there is no change in the patient; but if it is right or gives an approximation to the truth, he reacts to it with an unmistakable aggravation of his symptoms and of his general condition.

We may sum the matter up by asserting that there is no justification for the reproach that we neglect or underestimate the importance of the attitude taken up by those under analysis towards our constructions. We pay attention to them and often derive valuable information from them. But these reactions on the part of the patient are rarely unambiguous and give no opportunity for a final judgement. Only the further course of the analysis enables us to decide whether our constructions are correct or unserviceable. We do not pretend that an individual construction is anything more than a conjecture which awaits examination, confirmation or rejection. We claim no authority for it, we require no direct agreement from the patient, nor do we argue with him if at first he denies it. In short, we conduct ourselves on the model of a familiar figure in one of Nestroy's farces - the manservant who has a single answer on his lips to every question or objection: 'It will all become clear in the course of future developments.'

III

How this occurs in the process of the analysis - the way in which a conjecture of ours is transformed into the patient's conviction - this is hardly worth describing. All of it is familiar to every analyst from his daily experience and is intelligible without difficulty. Only one point requires investigation and explanation. The path that starts from the analyst's construction ought to end in the patient's recollection; but it does not always lead so far. Quite often we do not succeed in bringing the patient to recollect what has been repressed. Instead of that, if the analysis is carried out correctly, we produce in him an assured conviction of the truth of the construction which achieves the same therapeutic result as a recaptured memory. The problem of what the circumstances are in which this occurs and of how it is possible that what appears to be an incomplete substitute should nevertheless produce a complete result - all of this is matter for a later enquiry.

I shall conclude this brief paper with a few remarks which open up a wider perspective. I have been struck by the manner in which, in certain analyses, the communication of an obviously apt construction has evoked in the patients a surprising and at first incomprehensible phenomenon. They have had lively recollections called up in them - which they themselves have described as 'ultra-clear' - but what they have recollected has not been the event that was the subject of the construction but details relating to that subject. For instance, they have recollected with abnormal sharpness the faces of the people involved in the construction or the rooms in which something of the sort might have happened, or, a step further away, the furniture in such rooms - on the subject of which the construction had naturally no possibility of any knowledge. This has occurred both in dreams immediately after the construction had been put forward and in waking states resembling phantasies. These recollections have themselves led to nothing further and it has seemed plausible to regard them as the product of a compromise. The 'upward drive' of the repressed, stirred into activity by the putting forward of the construction, has striven to carry the important memory-traces into consciousness; but a resistance has succeeded, not, it is true, in *stopping* that movement, but in *displacing* it on to adjacent objects of minor significance.

These recollections might have been described as hallucinations if a belief in their actual presence had been added to their clearness. The importance of this analogy seemed greater when I noticed that true hallucinations occasionally occurred in the case of other patients who were certainly not psychotic. My line of thought proceeded as follows. Perhaps it may be a general characteristic of hallucinations to which sufficient attention has not hitherto been paid that in them something that has been experienced in infancy and then forgotten returns - something that the child has seen or heard at a time when he could still hardly speak and that now forces its way into consciousness, probably distorted and displaced owing to the operation of forces that are opposed to this return. And, in view of the close relation between hallucinations and particular forms of psychosis, our line of thought may be carried still further. It may be that the delusions into which these hallucinations are so constantly incorporated may themselves be less independent of the upward drive of the unconscious and the return of the repressed than we usually assume. In the mechanism of a delusion we stress as a rule only two factors: the turning away from the real world and its motive forces on the one hand, and the influence exercised by wish-fulfilment on the content of the delusion on the other. But may it not be that the dynamic process is rather that the turning away from reality is exploited by the upward drive of the repressed in order to force its content into consciousness, while the resistances stirred up by this process and the trend to wish-fulfilment share the responsibility for the distortion and displacement of what is recollected? This is after all the familiar mechanism of dreams, which intuition has equated with madness from time immemorial.

This view of delusions is not, I think, entirely new, but it nevertheless emphasizes a point of view which is not usually brought into the foreground. The essence of it is that there is not only *method* in madness, as the poet has already perceived, but also a fragment of *historical truth*; and it is plausible to suppose that the compulsive belief attaching to delusions derives its strength precisely from infantile sources of this kind. All that I can produce to-day in support of this theory are reminiscences, not fresh impressions. It would probably be worth while to make an attempt to study cases of the disorder in question on the basis of the hypotheses that have been here put forward and also to carry out their treatment on those same lines. The vain effort would be abandoned of convincing the patient of the error of his delusion and of its contradiction of reality; and, on the contrary, the recognition of its kernel of truth would afford common ground upon which the therapeutic work could develop. That work would consist in liberating the fragment of historical truth from its distortions and its attachments to the actual present day and in leading it back to the point in the past to which it belongs. The transposing of material from a forgotten past on to the present or on to an expectation of the future is indeed a habitual occurrence in neurotics no less than in psychotics. Often enough, when a neurotic is led by an anxiety-state to expect the occurrence of some terrible event, he is in fact merely under the influence of a repressed memory (which is seeking to enter consciousness but cannot become conscious) that something which was at that time terrifying did really happen. I believe that we should gain a great deal of valuable knowledge from work of this kind upon psychotics even if it led to no therapeutic success.

I am aware that it is of small service to handle so important a subject in the cursory fashion that I have here employed. But none the less I have not been able to resist the seduction of an analogy. The delusions of patients appear to me to be the equivalents of the constructions which we build up in the course of an analytic treatment - attempts at explanation and cure, though it is true that these, under the conditions of a psychosis, can do no more than replace the fragment of reality that is being disavowed in the present by another fragment that had already been disavowed in the remote past. It will be the task of each individual investigation to reveal the intimate connections between the material of the present disavowal and that of the original repression. Just as our construction is only effective because it recovers a fragment of lost experience, so the delusion owes its convincing power to the element of historical truth which it inserts in the place of the rejected reality. In this way a proposition which I originally asserted only of hysteria would apply also to delusions - namely, that those who are subject to them are suffering from their own reminiscences. I never intended by this short formula to dispute the complexity of the causation of the illness or to exclude the operation of many other factors.

If we consider mankind as a whole and substitute it for the single human individual, we discover that it too has developed delusions which are inaccessible to logical criticism and which contradict reality. If, in spite of this, they are able to exert an extraordinary power over men, investigation leads us to the same explanation as in the case of the single individual. They owe their power to the element of *historical truth* which they have brought up from the repression of the forgotten and *primaeval* past.

SPLITTING OF THE EGO IN THE PROCESS OF DEFENCE
(1940)

Intentionally left blank

SPLITTING OF THE EGO IN THE PROCESS OF DEFENCE

I find myself for a moment in the interesting position of not knowing whether what I have to say should be regarded as something long familiar and obvious or as something entirely new and puzzling. But I am inclined to think the latter.

I have at last been struck by the fact that the ego of a person whom we know as a patient in analysis must, dozens of years earlier, when it was young, have behaved in a remarkable manner in certain particular situations of pressure. We can assign in general and somewhat vague terms the conditions under which this comes about, by saying that it occurs under the influence of a psychical trauma. I prefer to select a single sharply defined special case, though it certainly does not cover all the possible modes of causation.

Let us suppose, then, that a child's ego is under the sway of a powerful instinctual demand which it is accustomed to satisfy and that it is suddenly frightened by an experience which teaches it that the continuance of this satisfaction will result in an almost intolerable real danger. It must now decide either to recognize the real danger, give way to it and renounce the instinctual satisfaction, or to disavow reality and make itself believe that there is no reason for fear, so that it may be able to retain the satisfaction. Thus there is a conflict between the demand by the instinct and the prohibition by reality. But in fact the child takes neither course, or rather he takes both simultaneously, which comes to the same thing. He replies to the conflict with two contrary reactions, both of which are valid and effective. On the one hand, with the help of certain mechanisms he rejects reality and refuses to accept any prohibition; on the other hand, in the same breath he recognizes the danger of reality, takes over the fear of that danger as a pathological symptom and tries subsequently to divest himself of the fear. It must be confessed that this is a very ingenious solution of the difficulty. Both of the parties to the dispute obtain their share: the instinct is allowed to retain its satisfaction and proper respect is shown to reality. But everything has to be paid for in one way or another, and this success is achieved at the price of a rift in the ego which never heals but which increases as time goes on. The two contrary reactions to the conflict persist as the centre-point of a splitting of the ego. The whole process seems so strange to us because we take for granted the synthetic nature of the processes of the ego. But we are clearly at fault in this. The synthetic function of the ego, though it is of such extraordinary importance, is subject to particular conditions and is liable to a whole number of disturbances.

It will assist if I introduce an individual case history into this schematic disquisition. A little boy, while he was between three and four years of age, had become acquainted with the female genitals through being seduced by an older girl. After these relations had been broken off, he carried on the sexual stimulation set going in this way by zealously practising manual masturbation; but he was soon caught at it by his energetic nurse and was threatened with castration, the carrying out of which was, as usual, ascribed to his father. There were thus present in this case conditions calculated to produce a tremendous effect of fright. A threat of castration by itself need not produce a great impression. A child will refuse to believe in it, for he cannot easily imagine the possibility of losing such a highly prized part of his body. His sight of the female genitals might have convinced our child of that possibility. But he drew no such conclusion from it, since his disinclination to doing so was too great and there was no motive present which could compel him to. On the contrary, whatever uneasiness he may have felt was calmed by the reflection that what was missing would yet make its appearance: she would grow one (a penis) later. Anyone who has observed enough small boys will be able to recollect having come across some such remark at the sight of a baby sister's genitals. But it is different if both factors are present together. In that case the threat revives the memory of the perception which had hitherto been regarded as harmless and finds in that memory a dreaded confirmation. The little boy now thinks he understands why the girl's genitals showed no sign of a penis and no longer ventures to doubt that his own genitals may meet with the same fate. Thenceforward he cannot help believing in the reality of the danger of castration.

The usual result of the fright of castration, the result that passes as the normal one, is that, either immediately or after some considerable struggle, the boy gives way to the threat and obeys the prohibition either wholly or at least in part (that is, by no longer touching his genitals with his hand). In other words, he gives up, in whole or in part, the satisfaction of the instinct. We are prepared to hear, however, that our present patient found another way out. He created a substitute for the penis which he missed in females - that is to say, a fetish. In so doing, it is true that he had disavowed reality, but he had saved his own penis. So long as he was not obliged to acknowledge that females have lost their penis, there was no need for him to believe the threat that had been made against him: he need have no fears for his own penis, so he could proceed with his masturbation undisturbed. This behaviour on the part of our patient strikes us forcibly as being a turning away from reality - a procedure which we should prefer to reserve for psychoses. And it is in fact not very different. Yet we will suspend our judgement, for upon closer inspection we shall discover a not unimportant distinction. The boy did not simply contradict his perceptions and hallucinate a penis where there was none to be seen; he effected no more than a displacement of value - he transferred the importance of the penis to another part of the body, a procedure in which he was assisted by the mechanism of regression (in a manner which need not here be explained). This displacement, it is true, related only to the female body; as regards his own penis nothing was changed.

This way of dealing with reality, which almost deserves to be described as artful, was decisive as regards the boy's practical behaviour. He continued with his masturbation as though it implied no danger to his penis; but at the same time, in complete contradiction to his apparent boldness or indifference, he developed a symptom which showed that he nevertheless did recognize the danger. He had been threatened with being castrated by his father, and immediately afterwards, simultaneously with the creation of his fetish, he developed an intense fear of his father punishing him, which it required the whole force of his masculinity to master and overcompensate. This fear of his father, too, was silent on the subject of castration: by the help of regression to an oral phase, it assumed the form of a fear of being eaten by his father. At this point it is impossible to forget a primitive fragment of Greek mythology which tells how Kronos, the old Father God, swallowed his children and sought to swallow his youngest son Zeus like the rest, and how Zeus was saved by the craft of his mother and later on castrated his father. But we must return to our case history and add that the boy produced yet another symptom, though it was a slight one, which he has retained to this day. This was an anxious susceptibility against either of his little toes being touched, as though, in all the to and fro between disavowal and acknowledgement, it was nevertheless castration that found the clearer expression. . . .

SOME ELEMENTARY LESSONS IN PSYCHO-ANALYSIS
(1940)

Intentionally left blank

SOME ELEMENTARY LESSONS IN PSYCHO-ANALYSIS

An author who sets out to introduce some branch of knowledge - or, to put it more modestly, some branch of research - to an uninstructed public must clearly make his choice between two methods or techniques.

It is possible to start off from what every reader knows (or thinks he knows) and regards as self-evident, without in the first instance contradicting him. An opportunity will soon occur for drawing his attention to facts in the same field, which, though they are known to him, he has so far neglected or insufficiently appreciated. Beginning from these, one can introduce further facts to him of which he has *no* knowledge and so prepare him for the necessity of going beyond his earlier judgements, of seeking new points of view and of taking new hypotheses into consideration. In this way one can get him to take a part in building up a new theory about the subject and one can deal with his objections to it during the actual course of the joint work. A method of this kind might well be called *genetic*. It follows the path along which the investigator himself has travelled earlier. In spite of all its advantages, it has the defect of not making a sufficiently striking effect upon the learner. He will not be nearly so much impressed by something which he has watched coming into existence and passing through a slow and difficult period of growth as he would be by something that is presented to him ready-made as an apparently self-contained whole.

It is precisely this last effect which is produced by the alternative method of presentation. This other method, the *dogmatic* one, begins straight away by stating its conclusions. Its premisses make demands upon the audience's attention and belief and very little is adduced in support of them. And there is then a danger that a critical hearer may shake his head and say: 'All this sounds most peculiar: where does the fellow get it from?'

In what follows I shall not rely exclusively upon either of the two methods of presentation: I shall make use now of one and now of the other. I am under no delusion about the difficulty of my task. Psycho-analysis has little prospect of becoming liked or popular. It is not merely that much of what it has to say offends people's feelings. Almost as much difficulty is created by the fact that our science involves a number of hypotheses - it is hard to say whether they should be regarded as postulates or as products of our researches - which are bound to seem very strange to ordinary modes of thought and which fundamentally contradict current views. But there is no help for it. We must begin our brief study with two of these hazardous hypotheses.

THE NATURE OF THE PSYCHICAL

Psycho-analysis is a part of the mental science of psychology. It is also described as 'depth psychology' - we shall later discover why. If someone asks what 'the psychical' really means, it is easy to reply by enumerating its constituents: our perceptions, ideas, memories, feelings and acts of volition - all these form part of what is psychical. But if the questioner goes further and asks whether there is not some common quality possessed by all these processes which makes it possible to get nearer to the *nature*, or, as people sometimes say, the *essence* of the psychical, then it is harder to give an answer.

If an analogous question had been put to a physicist (as to the nature of electricity, for instance), his reply, until quite recently, would have been: 'For the purpose of explaining certain phenomena, we assume the existence of electrical forces which are present in things and which emanate from them. We study these phenomena, discover the laws that govern them and even put them to practical use. This satisfies us provisionally. We do not know the *nature* of electricity. Perhaps we may discover it later, as our work goes on. It must be admitted that what we are ignorant of is precisely the most important and interesting part of the whole business, but for the moment that does not worry us. It is simply how things happen in the natural sciences.'

Psychology, too, is a natural science. What else can it be? But its case is different. Not everyone is bold enough to make judgements about physical matters; but everyone - the philosopher and the man in the street alike - has his opinion on psychological questions and behaves as if he were at least an *amateur* psychologist. And now comes the remarkable thing. Everyone - or almost everyone - was agreed that what is psychical really *has* a common quality in which its essence is expressed: namely the quality of *being conscious* - unique, indescribable, but needing no description. All that is conscious, they said, is psychical, and conversely all that is psychical is conscious: that is self-evident and to contradict it is nonsense. It cannot be said that this decision threw much light upon the nature of the psychical, for consciousness is one of the fundamental facts of our life and our researches come up against it like a blank wall and can find no path beyond it. Moreover the equation of what is mental with what is conscious had the unwelcome result of divorcing psychical processes from the general context of events in the universe and of setting them in complete contrast to all others. But this would not do, since the fact could not long be overlooked that psychical phenomena are to a high degree dependent upon somatic influences and on their side have the most powerful effects upon somatic processes. If ever human thought found itself in an *impasse* it was here. To find a way out, the philosophers at least were obliged to assume that there were organic processes parallel to the conscious psychical ones, related to them in a manner that was hard to explain, which acted as intermediaries in the reciprocal relations between 'body and mind', and which served to re-insert the psychical into the texture of life. But this solution remained unsatisfactory.

Psycho-analysis escaped such difficulties as these by energetically denying the equation between what is psychical and what is conscious. No; being conscious cannot be the essence of what is psychical. It is only a *quality* of what is psychical, and an inconstant quality at that - one that is far oftener absent than present. The psychical, whatever its nature may be, is in itself unconscious and probably similar in kind to all the other natural processes of which we have obtained knowledge.

Psycho-analysis bases this assertion on a number of facts, of which I shall now proceed to give a selection.

We know what is meant by ideas 'occurring' to one - thoughts that suddenly come into consciousness without one's being aware of the steps that led up to them, though they, too, must have been psychical acts. It can even happen that one arrives in this way at the solution of some difficult intellectual problem which has previously for a time baffled one's efforts. All the complicated processes of selection, rejection and decision which occupied the interval were withdrawn from consciousness. We shall not be putting forward any new theory in saying that they were unconscious and perhaps, too, remained so.

In the second place, I shall pick a single instance to represent an immensely large class of phenomena.¹ The President of a public body (the Lower House of the Austrian Parliament) on one occasion opened a sitting with the following words: 'I take notice that a full quorum of members is present and herewith declare the sitting *closed*.' It was a slip of the tongue - for there can be no doubt that what the President intended to say was 'opened'. Why, then, did he say the opposite? We shall expect to be told it was an accidental mistake, a failure in carrying out an intention such as may easily happen for various reasons: it had no meaning - and in any case contraries are particularly easily substituted for each other. If, however, we bear in mind the situation in which the slip of the tongue occurred, we shall be inclined to prefer another explanation. Many of the previous sittings of the House had been disagreeably stormy and had accomplished nothing, so that it would be only too natural for the President to think at the moment of making his opening statement: 'If only the sitting that's just beginning were finished! I would much rather be closing than opening it!' When he began to speak he was probably not aware of this wish - it was not conscious to him - but it was certainly present and it succeeded in making itself effective, against the speaker's will, in his apparent mistake. A single instance can scarcely enable us to decide between two such different explanations. But what if every other instance of a slip of the tongue could be explained in the same way, and similarly every slip of the pen, every case of mis-reading or mis-hearing, and every faulty action? What if in all those instances (one might actually say, without a single exception) it was possible to demonstrate the presence of a psychical act - a thought, a wish or an intention - which would account for the apparent mistake and which was unconscious at the moment at which it became effective, even though it may have been conscious previously? If that were so, it would really no longer be possible to dispute the fact that psychical acts which are unconscious do exist and that they are even sometimes active while they are unconscious and that in that case they can even sometimes get the better of conscious intentions. The person concerned in a mistake of this kind can react to it in various ways. He may overlook it completely or he may notice it himself and become embarrassed and ashamed. He cannot as a rule find the explanation of it himself without outside help; and he often refuses to accept the solution when it is put before him - for a time, at all events.

¹ Cf. *The Psychopathology of Everyday Life* (1901*b*)

In the third place, finally, it is possible in the case of persons in a state of hypnosis to prove experimentally that there are such things as unconscious psychical acts and that consciousness is not an indispensable condition of activity. Anyone who has witnessed such an experiment will receive an unforgettable impression and a conviction that can never be shaken. Here is more or less what happens. The doctor enters the hospital ward, puts his umbrella in the corner, hypnotizes one of the patients and says to him: 'I'm going out now. When I come in again, you will come to meet me with my umbrella open and hold it over my head.' The doctor and his assistants then leave the ward. As soon as they come back, the patient, who is no longer under hypnosis, carries out exactly the instructions that were given him while he was hypnotized. The doctor questions him: 'What's this you're doing? What's the meaning of all this?' The patient is clearly embarrassed. He makes some lame remark such as 'I only thought, doctor, as it's raining outside you'd open your umbrella in the room before you went out.' The explanation is obviously quite inadequate and made up on the spur of the moment to offer some sort of motive for his senseless behaviour. It is clear to us spectators that he is in ignorance of his real motive. We, however, know what it is, for we were present when the suggestion was made to him which he is now carrying out, while he himself knows nothing of the fact that it is at work in him.¹

¹ I am describing experiments made by Bernheim at Nancy in 1889 at which I myself assisted. In these days there is no need for me to discuss any doubts as to the genuineness of hypnotic phenomena of this kind.

The question of the relation of the conscious to the psychical may now be regarded as settled: consciousness is only a *quality* or attribute of what is psychical, and moreover an inconstant one. But there is one further objection with which we have to deal. We are told that, in spite of the facts that have been mentioned, there is no necessity to abandon the identity between what is conscious and what is psychical: the so-called unconscious psychical processes are the organic processes which have long been recognized as running parallel to the mental ones. This, of course, would reduce our problem to an apparently indifferent matter of definition. Our reply is that it would be unjustifiable and inexpedient to make a breach in the unity of mental life for the sake of propping up a definition, since it is clear in any case that consciousness can only offer us an incomplete and broken chain of phenomena. And it can scarcely be a matter of chance that it was not until the change had been made in the definition of the psychical that it became possible to construct a comprehensive and coherent theory of mental life.

Nor need it be supposed that this alternative view of the psychical is an innovation due to psycho-analysis. A German philosopher, Theodor Lipps, asserted with the greatest explicitness that the psychical is in itself unconscious and that the unconscious is the truly psychical. The concept of the unconscious has long been knocking at the gates of psychology and asking to be let in. Philosophy and literature have often toyed with it, but science could find no use for it. Psycho-analysis has seized upon the concept, has taken it seriously and has given it a fresh content. By its researches it has led to a knowledge of characteristics of the unconscious psychical which have hitherto been unsuspected, and it has discovered some of the laws which govern it. But none of this implies that the quality of being conscious has lost its importance for us. It remains the one light which illuminates our path and leads us through the darkness of mental life. In consequence of the special character of our discoveries, our scientific work in psychology will consist in translating unconscious processes into conscious ones, and thus filling in the gaps in conscious perception. . . .

A COMMENT ON ANTI-SEMITISM
(1938)

Intentionally left blank

A COMMENT ON ANTI-SEMITISM

In the course of examining the remarks in the press and in literature provoked by the recent persecutions of the Jews, I came upon one essay which struck me as so unusual that I made *précis* of it for my own use. What its author wrote was approximately as follows:

‘By way of preface I must explain that I am not a Jew and therefore I am not driven into making these observations by any egoistic concern. Yet I have felt a lively interest in the anti-semitic excesses of to-day and have directed my particular attention to the protests against them. These protests come from two directions - ecclesiastical and secular - the former in the name of religion, the latter appealing to the claims of humanity. The former were scanty and came late; but they *did* come in the end, and even His Holiness the Pope raised his voice. I confess that there was something I missed in the demonstrations coming from *both* sides - something at their beginning and something else at their end. I will try now to supply it.

‘All these protests, I think, might be preceded by a particular introduction, which would run: "Well, it's true, I don't like Jews either. In some sort of way they seem strange to me and antipathetic. They have many disagreeable qualities and great defects. I think, too, that the influence they have had on us and our affairs has been predominantly detrimental. Their race, compared with our own, is obviously an inferior one; all their activities argue in favour of that." And after this what these protests do in fact contain could follow *without any discrepancy*: "But we profess a religion of love. We ought to love even our enemies as ourselves. We know that the Son of God gave His life on earth to redeem *all* men from the burden of sin. He is our model, and it is therefore sinning against His intention and against the command of the Christian religion if we consent to Jews being insulted, ill-treated, robbed and plunged into misery. We ought to protest against this, irrespectively of how much or how little the Jews deserve such treatment." The secular writers who believe in the gospel of humanity, protest in similar terms.

'I confess that I have not been satisfied by any of these demonstrations. Apart from the religion of love and humanity there is also a religion of truth, and it has come off badly in these protests. But the truth is that for long centuries we have treated the Jewish people unjustly and that we are continuing to do so by judging them unjustly. Any one of us who does not start by admitting our guilt has not done his duty in this. The Jews are not worse than we are; they have somewhat other characteristics and somewhat other faults, but on the whole we have no right to look down on them. In some respects, indeed, they are our superiors. They do not need so much alcohol as we do in order to make life tolerable; crimes of brutality, murder, robbery and sexual violence are great rarities among them; they have always set a high value on intellectual achievement and interests; their family life is more intimate; they take better care of the poor; charity is a sacred duty to them. Nor can we call them in any sense inferior. Since we have allowed them to co-operate in our cultural tasks, they have acquired merit by valuable contributions in all the spheres of science, art and technology, and they have richly repaid our tolerance. So let us cease at last to hand them out favours when they have a claim to justice.'

It was natural that such determined partisanship from some one who was not a Jew should have made a deep impression on me. But now I have a remarkable confession to make. I am a very old man and my memory is no more what it was. I can no longer recall where I read the essay of which I made the *précis* nor who it was who was its author. Perhaps one of the readers of this periodical will be able to come to my help?

A whisper has just reached my ears that what I probably had in mind was Count Heinrich Coudenhove-Kalergi's book *Das Wesen des Antisemitismus*, which contains precisely what the author I am in search of missed in the recent protests, and more besides. I know that book. It appeared first in 1901 and was re-issued by his son in 1929 with an admirable introduction. But it cannot be that. What I am thinking of is a shorter pronouncement and one of very recent date. Or am I altogether at fault? Does nothing of the kind exist? And has the work of the two Coudenhoves had no influence on our contemporaries?

Sigm. Freud

LOU ANDREAS-SALOMÉ
(1937)

On February 5 of this year Frau Lou Andreas-Salomé died peacefully in her little house at Göttingen, almost 76 years of age. For the last 25 years of her life this remarkable woman was attached to psycho-analysis, to which she contributed valuable writings and which she practised as well. I am not saying too much if I acknowledge that we all felt it as an honour when she joined the ranks of our collaborators and comrades in arms, and at the same time as a fresh guarantee of the truth of the theories of analysis.

It was known that as a girl she had kept up an intense friendship with Friedrich Nietzsche, founded upon her deep understanding of the philosopher's bold ideas. This relationship came to an abrupt end when she refused the proposal of marriage which he made her. It was well known, too, that many years later she had acted alike as Muse and protecting mother to Rainer Maria Rilke, the great poet, who was a little helpless in facing life. But beyond this her personality remained obscure. Her modesty and discretion were more than ordinary. She never spoke of her own poetical and literary works. She clearly knew where the true values in life are to be looked for. Those who were closer to her had the strongest impression of the genuineness and harmony of her nature and could discover with astonishment that all feminine frailties, and perhaps most human frailties, were foreign to her or had been conquered by her in the course of her life.

It was in Vienna that long ago the most moving episode of her feminine fortunes had been played out. In 1912 she returned to Vienna in order to be initiated into psycho-analysis. My daughter, who was her close friend, once heard her regret that she had not known psycho-analysis in her youth. But, after all, in those days there was no such thing.

Sigm. Freud

February, 1937.

FINDINGS, IDEAS, PROBLEMS (1941 [1938])

London, June.

June 16. - It is interesting that in connection with early experiences, as contrasted with later experiences, all the various reactions to them survive, of course including contradictory ones. Instead of a decision, which would have been the outcome later. Explanation: weakness of the power of synthesis, retention of the characteristic of the primary processes.

July 12. - As a substitute for penis-envy, identification with the clitoris: neatest expression of inferiority, source of all inhibitions. At the same time disavowal of the discovery that other women too are without a penis.

'Having' and 'being' in children. Children like expressing an object-relation by an identification: 'I am the object.' 'Having' is the later of the two; after loss of the object it relapses into 'being'. Example: the breast. 'The breast is a part of me, I am the breast.' Only later: 'I have it' - that is, 'I am not it' . . .

July 12. - With neurotics it is as though we were in a prehistoric landscape - for instance, in the Jurassic. The great saurians are still running about; the horsetails grow as high as palms (?).

July 20. - The hypothesis of there being inherited vestiges in the id alters, so to say, our views about it.

July 20. - The individual perishes from his internal conflicts, the species perishes in its struggle with the external world to which it is no longer adapted. - This deserves to be included in *Moses*.

August 3. - A sense of guilt also originates from unsatisfied love. Like hate. In fact we have been obliged to derive every conceivable thing from that material: like economically self-sufficient States with their '*Ersatz* products'.

August 3. - The ultimate ground of all intellectual inhibitions and all inhibitions of work seems to be the inhibition of masturbation in childhood. But perhaps it goes deeper; perhaps it is not its inhibition by external influences but its unsatisfying nature in itself. There is always something lacking for complete discharge and satisfaction - en attendant toujours quelque chose qui ne venait point¹ - and this missing part, the reaction of orgasm, manifests itself in equivalents in other spheres, in *absences*, outbreaks of laughing, weeping, and perhaps other ways. - Once again infantile sexuality has fixed a model in this.

August 22. - Space may be the projection of the extension of the psychical apparatus. No other derivation is probable. Instead of Kant's *a priori* determinants of our psychical apparatus. Psyche is extended; knows nothing about it.

August 22. - Mysticism is the obscure self-perception of the realm outside the ego, of the id.

ANTI-SEMITISM IN ENGLAND
(1938)

20 Maresfield Gardens
London, N.W.3.
16.11.1938.

To the Editor of *Time and Tide*.

I came to Vienna as a child of 4 years from a small town in Moravia. After 78 years of assiduous work I had to leave my home, saw the Scientific Society I had founded, dissolved, our institutions destroyed, our Printing Press ('Verlag') taken over by the invaders, the books I had published confiscated or reduced to pulp, my children expelled from their professions. Don't you think you ought to reserve the columns of your special number for the utterances of non-Jewish people, less personally involved than myself?

In this connection my mind gets hold of an old French saying:

Le bruit est pour le fat
La plainte est pour le sot;
L'honnête homme trompé
S'en va et ne dit mot.¹

I feel deeply affected by the passage in your letter acknowledging 'a certain growth of anti-semitism even in this country'. Ought this present persecution not rather give rise to a wave of sympathy in this country?

Respectfully yours
Sigm. Freud.

¹ ['A fuss becomes the Fop
A Fool's complaints are heard;
A Gentleman betrayed
Departs without a word.']

Using This Edition

Here are some keyboard shortcuts and tips on using this edition that may not be immediately obvious.

Press **F1** for general help.

Press **F4** to hide/show the **Bookmarks** or **Pages** panel.

Press **F6** to move between the text and navigation panes.

Press **F8** to hide/show the toolbar.

Press **F9** to hide/show the menu bar.

Press **Ctrl F** to find a particular word or phrase.

Press **Ctrl G** to find the next match.

Press **Ctrl H** to change to/from **Reading Mode**. **Reading Mode** hides the toolbar and navigation pane.

Press **Ctrl L** to change to/from full screen mode.

Press **Ctrl 0** to fit the page to the screen.

Press **Ctrl 2** to fit the page to the width of the screen.

Press **Ctrl 3** to fit the text to the width of the screen.

Press **Ctrl +** to increase the font size.

Press **Ctrl -** to decrease the font size.

Press **Ctrl Shift F** for advanced search options.

Press **Ctrl Shift N** to go to a particular page.

Press **Shift F10** to activate the right-click popup menu for the active pane.

Press **Down Arrow** or **PgDn** to scroll down.

Press **Up Arrow** or **PgUp** to scroll up.

Press **Ctrl PgDn** (or **Forward Arrow** if the horizontal scroll bar is not visible) to go to the top of the next page.

Press **Ctrl PgUp** (or **Back Arrow** if the horizontal scroll bar is not visible) to go to the top of the previous page.

Press **Home** to go to the first page.

Press **End** to go to the last page.

Press **Alt Left Arrow** to go to the previous view.

Press **Alt Right Arrow** to go to the next view.

Right-click in the text pane to

Select the **Select Tool** – copying has been disabled in this edition of the text

Select the **Hand Tool** – allows dragging of the text with the mouse

Show the navigation pane (if hidden)

Right-click in the far-left of the navigation pane to

Hide/show the **Bookmarks** or **Pages** panel

Hide the navigation pane

Right-click in the **Bookmarks** panel to enable/disable the wrapping of long bookmarks.

Drag the vertical separator bar to change the relative sizes of the navigation and text panes.

The text is best viewed with the navigation pane hidden and the **Fit To Width** option enabled. The navigation pane and **Bookmarks** panel show by default at startup. You may want to hide these once you have selected the work you wish to view.

Press **Alt** and the underlined character to activate menu options.

Press **Alt Space** to activate the **Windows®** system menu, which you can then use to **Move**, **Size**, **Minimize**, **Maximize**, **Restore** or **Close** the window.

The above apply to **Acrobat® Reader Version 8 for Windows®** and may differ in other versions of the software.

About This Edition

The intention of this edition is to make Freud freely available to anyone who wants him.

You are encouraged to distribute this file. On no account, however, may anything, other than a nominal fee for its distribution, be charged.

This text is also available in the following formats:

Microsoft® CHM (Freud_Complete_Works.chm)

EPUB® (Freud_Complete_Works.epub)

Amazon Kindle®/Mobipocket® MOBI (Freud_Complete_Works.mobi)

Isilo® PDB (Freud_Complete_Works.pdb)

Microsoft® HLP (Frcw2.zip)

The text in all six versions is, apart from a few minor textual corrections, identical.
